Piracy case settled

Defendants admit to unauthorized copying, agree to reimburse vendor

By Peter Bartolik
CW Staff

ARLINGTON, Va. — The Association of Data Processing Service Organizations, Inc. announced here last week an out-of-court cash settlement in which American Brands, Inc. and its subsidiary admitted to unauthorized software duplication by the subsidiary.

A lawsuit filed earlier this year by Adapso, in conjunction with Micropro International Corp. [CW, Jan. 21], alleged that the Chicago-based subsidiary, Wilson Jones Co., had engaged in the unauthorized reproduction and distribution of three Micropro products — Wordstar, Mailmerge and Spellstar.

A joint statement agreed to by the parties in the litigation announced that "some software products have in the past been improperly duplicated by some [Wilson Jones] personnel, although such duplication was without the knowledge or acquiescence of [American Brands] or its executives."

NCR user wins $5.8 million suit

By Jeffry Beeler
CW West Coast Bureau

SAN LUIS OBISPO, Calif. — A Superior Court jury here has awarded $5.8 million to a Southern California businessman after finding that NCR Corp. had misrepresented the capabilities of a system the vendor sold him in 1977.

The award stems from a six-year lawsuit in which Alex Madonna accused NCR of selling him a system that lacked the appropriate mass storage to meet his construction company's information processing needs.

NCR's attorney, Robert Wendt, accused the jury of "allowing NCR's wealth to bias its verdict" and promised to file a posttrial motion for reversal of the court's decision. If the motion is rejected, the defendant will appeal, he said.

The award is the largest granted in a misrepresentation case involving a computer vendor, exceeding the $2.6 million NCR paid a California dry cleaner [CW, Nov. 1, 1982] after being found guilty of willful fraud and misrepresentation.

Ramis II enhanced for production applications

By John Desmond
CW Staff

WASHINGTON, D.C. — In a series of product announcements here, Martin Marietta Data Systems last week enhanced the performance of its Ramis II fourth-generation language in production applications. It also extended the product's reporting capabilities to users of AT&T's Unix System V and IBM Personal Computers.

Martin Marietta also announced products intended to merge Ramis II with the UFO applications development system originated by Oxford Software Corp., which Martin Marietta acquired in January.

The company announced the following:

■ A System Building Executive component for Ramis II. A successor to the Ramis II Executive, SBX was designed to meet the performance requirements of major production applications while maintaining the nonprocedural programming aspects of Ramis II. SBX offers 10 times the performance of the Ramis II Executive, a spokesman said. SBX is a compiled system, said to generate more compact code than Ramis II, which is interpretive.

■ An optional intelligent editor component of SBX, dubbed Smartedit. Smartedit is for use in development and maintenance environments to improve productivity for applications developers and experienced end users. With the editor, Ramis II users can develop, modify, test and store Ramis II requests and SBX procedures within the Ramis II environment.

■ A Cobol-based applications development software product, designated Cobol/Extended Environment. Cobol/XE is an Ansi Cobol-based CICS applications development system that currently supports Cobol programming in IBM DOS and OS/CICS environments. Support in more operating environments is planned. Cobol/XE, the successor to UFO/Cobol, is said to improve efficiency of programmers writing on-line

FYI

Users key in on-line debugging

By Charles Babcock
CW New York Bureau

NEW YORK — As the complexity of software packages grows, so does the reliance on hot-line troubleshooting. But effective use of hot lines requires well-informed, well-prepared users as well as vendor expertise, according to hot-line managers.

To help handle the growing volume of calls, some software vendors are putting their troubleshooting services on-line, creating data banks of previously solved problems.

At Management Science America, Inc. in Atlanta, where calls come in at a rate of 400 to 500 a day, hot-line troubleshooters do keyword searches for cases similar to the one a caller is describing, said Kenneth M. Schultz, manager of client services.

Cullinet Software, Inc. enters each of its calls into an on-line tracking system, which can also be used for keyword searches of previously described problems, said Gary L. Wright, director of corporate technology support for the Westwood, Mass.-based firm.

Martin Marietta Data Systems in Princeton, N.J., is scrutinizing the on-line tracking system at the offices of former Oxford Software Corp., a recent acquisition. Martin Marietta would like to implement a similar system for its 130 calls a day, said Sue Goldberg, manager of technical assistance for Martin Marietta's Ramis II.

There remains, however, no substitute for close, two-way communication, sometimes a difficult thing to achieve over the telephone, according to the hot-line managers.

NEWSPAPER

MCI wins $38 million, may appeal

By Bryan Wilkins
CW Washington Bureau

CHICAGO — Although dissatisfied with the $37.8 million in damages awarded it by a jury last week, MCI Communications Corp. is undecided on whether to appeal the award in the retrial of its antitrust suit against AT&T.

Immediately following the verdict last Tuesday, MCI Chairman and Chief Executive Officer William McGowan said his company would appeal. But less than 24 hours later, McGowan was reconsidering that position, hinting that MCI would not want to jeopardize a separate but similar suit against AT&T that will go to trial within a year.

McGowan labeled the $37.8 million award, to be tripled under federal antitrust law to $113 million, insufficient to compensate for damages he claimed MCI had suffered. McGowan said the presiding judge had not instructed the jury sufficiently that the proof of six charges of AT&T's antitrust behavior had already been established in a lower court case — a finding upheld by an appeals court.

> *'We expected a lot more, we anticipated a lot more and the outcome was certainly not what we expected.'*
>
> **— Bert Roberts**
> **MCI Telecommunications Corp.**

In the trial that concluded last week, MCI argued unsuccessfully that it had suffered $5.8 billion in damages, including lost profits from postponing its Execunet business service.

AT&T said it had not decided whether it would appeal but indicated general satisfaction with the outcome. "We are pleased that the jury successfully grappled with the complex issues before it and was able to render a verdict in line with the evidence," the company said in a prepared statement.

The $113.3 million in trebled damages awarded MCI last week is far less than the $1.8 billion in damages, after trebling, awarded in 1980 when the case first was tried. MCI charged AT&T denied it the local connections needed to complete its calls. The charge was upheld by the jury in 1980, but the damages were remanded by a federal judge to the lower court for reconsideration.

AT&T now is liable to MCI for 31.5% of any damages amount, while six regional holding companies are responsible for the remaining amount. The seventh regional holding company, U.S. West, independently settled out of court with MCI for some $63 million in cash and other considerations, anticipating a higher award from the court in the retrial.

During the trial, presiding U.S. District Judge John F. Grady questioned the tactics of MCI in calculating the total "lost profits" it suffered. MCI did not break out the various components of residential and business service that were affected for the jury to make its own determination of what damages it had suffered.

AT&T argued that, at most, the damages incurred by MCI could not have exceeded $34 million, a figure the jury appeared to have followed.

The trial on the damages amount covers the period prior to 1975. MCI has filed a second antitrust suit in Washington, D.C., against AT&T alleging similar antitrust behavior for the period after 1975. That suit is scheduled to come to trial sometime next year.

Bert Roberts, president of MCI Telecommunications Corp., MCI's long-distance communications subsidiary, and a key witness in the trial, told *Computerworld* that while the company was surprised at the outcome of the jury's decision, it had not made any strategic plans in anticipation of a larger award.

"We've never run this company on anticipation that a jury would award us a large amount of money," Roberts said. "Obviously, we had asked for a lot more than we got. Based on our judgment, we expected a lot more, we anticipated a lot more and the outcome was certainly not what we expected.

"However, there was one clear issue to come out of the trial," Roberts added. "There was the jury's decision that none of the damages in this trial were related to Execunet [MCI's business service]. Those damages will be tried in the second antitrust trial, and you're going to see some big numbers talked about," Roberts said.

A spokesman for U.S. West, the regional holding company that had previously settled with MCI, said the company was "not at all unhappy" with its out-of-court settlement with MCI. He noted that the settlement also relieves the company of any potential liability that the other six Bell holding companies and AT&T may face as a result of the second round of antitrust charges still to be tried for the period from 1975 to the present.

IT'S INEVITABLE. EVERY COMPANY WILL NEED A RELATIONAL DATA BASE TO COMPETE.

"Miss Elliot, it's inevitable every company will need a relational data base to compete. Can you please find out what a relational data base is?"

When corporate management needs information, the last thing they want are excuses. Or explanations, no matter how logical they may be.

But what else can you do when the data base you're using doesn't let you get to that information quickly. If you're lucky enough to get to it at all.

The solution, of course, is a relational data base. A data base that lets you give management the information they need, the way they need it, when they need it.

ADR/DATACOM/DB® is the only relational data base management system that lets you give management access to all the company information. Because the data base they use to manage the company is the same exact data base the company uses to operate. And ADR/DATACOM/DB does it without sacrificing performance.

ADR/DATACOM/DB lets managers use relational query languages like ADR/DATAQUERY,® decision support systems like ADR/EMPIRE® and, with ADR/PC DATACOM,® even their own personal computers to get the information they need themselves.

And programmers can use powerful productivity tools like ADR/IDEAL,® our 4th generation application development system, to create applications quickly and turn data into strategic information.

ADR/DATACOM/DB allows system changes to be made quickly and easily. So it gives your company the flexibility to compete in a changing business world.

And, most important of all, ADR/DATACOM/DB still delivers the performance production demands. In fact, it is the only relational data base management system being used for high volume production applications.

It's inevitable every company will need a relational data base because it removes the barriers that separate management from the information it needs.

And ADR/DATACOM/DB is the relational data base that does it best.

For more information about the inevitable, mail us the coupon. Or call 1-800-ADR-WARE.

Switch to satellite net satisfies users' need for control

FIRST USER

By Paul Korzeniowski
CW Staff

Uncertain tariffs, problems stemming from working with a multitude of telephone companies and a desire to control their networks are the principal reasons why the first users of M/A Com, Inc.'s Integrated Satellite Business Network are trading in their private-line networks.

Wal-Mart Stores, Inc., based in Bentonville, Ark., and Southland Corp., located in Dallas, started looking for an alternative to their networks a year and a half ago. "When Ku-band transmission became available, satellite transmission became a cost-effective alternative to terrestrial transmission," said Robert L. Martin, vice-president of information systems at Wal-Mart.

The department store chain plans to connect its 750 stores and warehouses located in 20 states with a private, $16 million digital satellite network. A 9-meter earth station has been installed at Wal-Mart's Bentonville facility. It will be used for voice transmission between company locations and data transmission to and from the company's IBM 3081, 3083 or 4381 mainframes.

Other 1.8- or 2.4-meter stations will be placed at each Wal-Mart distributor or store. "The larger [2.4-meter] earth stations will be positioned where weather may hinder transmission or where stores are located at the edge of a footprint," Martin said. A footprint is the range of a satellite transmission.

The distributors house IBM 3033 or 4300 series mainframes; each store has one or two IBM Series/1 minicomputers. "Each earth station provides a bandwidth of up to 128K bit/sec.," Martin noted. He estimated that 56K bit/sec. will be used for data transmission, and the remaining bandwidth will be divided into 16K bit/sec. digitized voice trunks for a virtual private network.

The vice-president did not think echo delays inherent in satellite transmission would cause any problems. "There have been advancements in echo cancellation techniques that alleviate the problem of voice delay," Martin said. "However, there is still a slight delay."

The central earth station has been constructed and has been certified by the Federal Communications Commission. M/A Com will supply the earth stations, but Wal-Mart has not chosen a vendor to provide the satellite capacity. "We have narrowed the choice to three vendors," Martin said. "We will choose one by next month."

When the vendor is chosen, Wal-Mart will add two warehouses to the system. Full-scale implementation of the system will begin during the summer. Beginning in the fall, 50 stores per month will be added to the system until 750 locations are on the system in the first quarter of 1987.

New system, new applications

The new communications system will supply Wal-Mart with new applications. "Currently, we poll our warehouses three times a day," Martin said. "With the satellite network, we will be able to poll them more often. At first, the system will be underused, but we will require a wider bandwidth as we design more interactive applications."

In contrast, Southland initially will limit its satellite network to data transmission. "We are replacing our 100-line multidrop network with a satellite network," said William McMinn, manager of voice and data communications at Southland.

Southland operates more than 7,500 7-Eleven stores throughout the U.S. and Canada. The chain is managed by approximately 300 district offices equipped with IBM System/36 minicomputers.

At the hub of the satellite network is a 9-meter central earth station located in Dallas. "We tested an M/A Com earth station in January 1984 just to see if the system could transmit data to our Winter Haven, Fla., office," McMinn said.

When the test was successful, the company decided to link, by a satellite system, its district offices' hardware with IBM 3081 and Amdahl Corp. 5860 mainframes in Dallas. The $6 million satellite network will be used for 16 on-line applications, and a million transactions will be processed each day.

Southland, like Wal-Mart, has built its central station, has had it certified by the FCC and is negotiating with satellite vendors. The company will start adding offices to the network during the summer and plans to have it fully operational by June 1986.

May transfer voice net to satellite

When the data system is completed, Southland may transfer its voice network to the satellite system. "We have to test the voice capability to see if our users would be happy with the slight delay that accompanies satellite voice transmission," McMinn noted. "If the delay is minimal, we may add voice capability for all our district offices' earth stations. In the long term, we may place some earth stations at our stores and tie them into the network."

Video transmission may also be added. "We may want to transmit speeches from the president of the company to our district offices," McMinn said.

Even without the voice and video capabilities, the manager estimated that the satellite system would pay for itself in five years.

CICS-JUGGLER
The Multi-Session Manager for CICS

"The ability to easily view a multitude of menus allows faster access time. This saves a considerable amount of money spent for overtime hours since work can be accomplished during regular hours."

Sortland Yard warns against "Raffles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

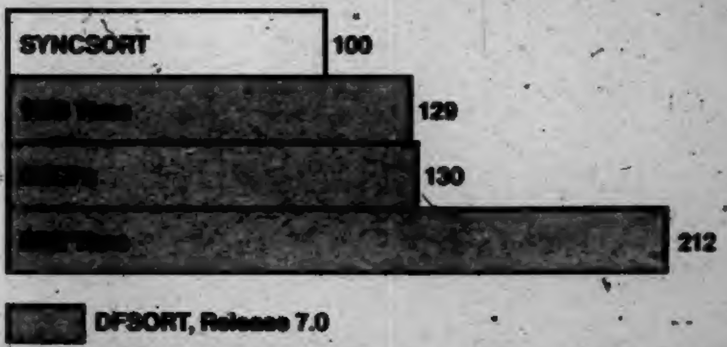
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied. "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

Information Builders unveils VAX version of Focus

By John Gallant
CW Staff

NEW ORLEANS — Information Builders, Inc. last week introduced a Digital Equipment Corp. VAX/VMS version of Focus, its widely installed fourth-generation language.

Unveiled at the Dexpo '85 conference here, the VAX version of Focus makes the product available for mainframes, minicomputers and microcomputers. Focus also runs on IBM mainframes and Personal Computers. A spokesman said Focus applications and data are portable across those environments, and users can access and transfer data between computers using the Focus language.

The spokesman said the VAX version of Focus runs under DEC's VMS 4.0 operating system and is scheduled for general shipment in the fall. Focus for the VAX features the following: a report writer; data management and applications development tools; a screen manager; an editor; screen painter; the company's Talk facilities, Financial Modeling Language (FML) and Foccalc spreadsheet; and graphics and statistics capabilities.

The report writer allows reports and ad hoc information requests to be formulated using the Focus nonprocedural language, which features sort, calculation and formatting capabilities as well as on-line error correction and Help facilities. The report writer can process Focus data bases, any DEC RMS files or RDB data bases and other third-party files.

Focus' data management capabilities are based on a shared-relational data model, the spokesman said, with all transaction processing accomplished through English statements. For applications development, Focus allows users to write programs, design screens and perform validations and table look-ups through English statements.

The Fidel screen manager facilitates the development of data entry and display screens, and the editor and screen painter facility — dubbed Ted — was designed to accommodate development of I/O screens and transaction processing logic.

The Talk facilities include programs for data base creation — Filetalk; data modification — Automod; and reporting — Tabletalk. The FML was designed to handle the creation, calculation and presentation of financially oriented data. Foccalc is a 1,000- by 1,000-matrix electronic spreadsheet with facilities for automatic data import, spreadsheet population and consolidation and cross-machine model transfer.

Using the nonprocedural language, the graphics tools allow for the creation of connected point plots, histograms, bar and pie charts and scatter diagrams. Statistics facilities provide a set of functions and analyses, including cross-tabs, time-series and regression analysis.

The spokesman said the VAX version of Focus is priced on a sliding scale from the Microvax I to the VAX 8600 and Vaxclusters. The one-time license fee for the Microvax I is $6,000 and $52,000 for the VAX 8600. Monthly license prices start at $550 for the VAX-11/720.

Information Builders is located at 1250 Broadway, New York, N.Y. 10001.

RAMIS

from page 1

transaction processing applications.

■ UFO/Ramis II Pathway, a further effort to integrate Ramis II with UFO. The product allows UFO users to generate reports from Vsam files maintained by UFO using Ramis II's fourth-generation syntax.

■ Versions of the Ramis II report writers for IBM PC-DOS and Unix System V environments, dubbed PC/Reporter and Unix/Reporter. PC/Reporter allows personal computer users with any sequential or comma-delimited Ascii files to generate reports using Ramis II's syntax. The product runs on any IBM Personal Computer, Personal Computer XT or AT equipped with two floppy disks and at least 512K bytes of memory. Unix/Reporter allows generation of reports from Unix flat files running on any micro, supermini or mainframe.

■ Enhancements to the Ramlink micro-mainframe link product, which so far has not been delivered in production quantities. The enhancements include support for Digital Consulting Associates, Inc.'s Irma and Forte Data Systems' Forte communications boards. The Ramlink enhancements are scheduled for availability this month as part of Ramis Release 85.2.

Martin Marietta also announced that an updated Data Base Manager (DBM) for Ramis II, which will allow for concurrent updating of the data base, is scheduled for fourth-quarter delivery. The company admitted that technical problems have pushed back delivery to that date.

SBX reportedly is a full-function programming language that provides structured programming facilities and supports screen- or line-oriented communications with terminal users. Marketing Vice-President Frank Fish said SBX was designed to improve the response time and reliability of interpretive languages such as Ramis II, which he said are not adequate for all users. Scheduled for availability this month, SBX will be provided for no charge as part of the Ramis II maintenance program. Migration to SBX from Ramis II Executive is not required, but migration aids are available.

Smartedit features include the use of templates to provide a structured outline of frequently used statements, full screen editing, a split screen, on-line Help and operation on procedures from Ramis II SBX libraries or on CMS and TSO system files. Scheduled for availability this month, Smartedit costs from $2,250 to $4,500.

Cobol/XE allows any Cobol programmer to write on-line programs under CICS or CMS as if they were batch programs. In addition to CICS/VS, Cobol/XE allows programmers to develop CICS applications under VM/CMS. With the product's screen painting facility, programmers can design screen layouts on a 3270 or Personal Computer XT/370 screen without writing code. Prices for Cobol/XE, which runs on IBM mainframes, are $15,000 for the VM/CMS version, $24,000 for the DOS/CICS version and $33,000 for the OS/CICS version. The product is available now.

UFO/Ramis II Pathway is a free component to users with both Ramis II and UFO. Deliveries of Pathway are scheduled for this month.

Ramis II Release 85.2 will also extend Ramlink support to CICS under DOS/VSE, CICS, MVS and Martin Marietta's Atlas under DOS/VSE. Ramlink also allows for bidirectional transfer of data from Ramis II data bases, Vsam and Isam files, Software AG's Adabas, Cincom Systems, Inc.'s Total, IBM's IMS and DL/1 data bases and Cullinet Software, Inc.'s IDMS.

Both PC/Reporter and Unix/Reporter are reportedly scheduled for third-quarter availability. On single-user machines, PC/Reporter costs $795, while the Unix/Reporter costs $995.

More information is available from Martin Marietta, P.O. Box 2392, Princeton, N.J. 08540.

News for CAD/CAM users.

This modem will pay for itself in Three ~~four~~ months.

(Based on our new low price of $995.)

The incredible AJ 4048—now with error-free asynchronous transmission—will send your data over 2-wire dial-up lines at 4800 bps full duplex.

It's the first high speed full-duplex 4800 bps dial-up. The low cost alternative to leased lines. Operates in synchronous or asynchronous modes.

Big savings, fast payback.

If your company's current 1200 bps full duplex data transmission is around 12 hours per week, an AJ 4048 could pay for itself with connect time savings in about three months. And that's just the beginning.

AJ 4048-AEC automatically detects errors and retransmits data for asynchronous applications requiring total accuracy.

Write or call for our free cost-savings chart and our new catalog.

Altos extends supermicro line with multiuser system

By Kathleen Sullivan
CW West Coast Bureau

SAN JOSE, Calif. — Altos Computer Systems, Inc. is slated to extend its lineup of supermicrocomputers today with the Altos 2086, a multiuser system based on Intel Corp.'s 80286 microprocessor.

The Altos 2086, which runs Microsoft Corp.'s Xenix 3.0 operating system, can support up to 20 users, the company said. The new system is said to be software compatible with the IBM Personal Computer AT. It also reportedly can read and write IBM Personal Computer AT diskettes and run most software written for the Personal Computer AT under Xenix.

The Altos 2086 is said to feature a modular, multiple-board design. In a 20-user configuration, the system includes a CPU board, a random-access memory (RAM) board, two file processor subsystem boards and two serial communications boards. Two additional board slots are available for expanding the system, the company said.

The Altos 2086's CPU board is said to include an 80286 microprocessor running at 8 MHz with no wait states. The CPU board contains 4K bytes of high-speed RAM cache memory. This cache memory can temporarily hold portions of main memory, allowing the microprocessor to gain faster access to data and instructions, the company said.

The Altos 2086's RAM board can accommodate up to 8M bytes of RAM, using 2M- or 4M-byte boards, according to the vendor.

At the center of the Altos 2086 is a two-board file processor subsystem. One board reportedly contains storage device controllers. A second board, which contains an Intel 8086 microprocessor running at 8 MHz, controls file access, managing four direct memory access channels.

In a standard configuration, the system includes a 1.2M-byte floppy disk drive, a 60M-byte streaming tape drive and a 63M-byte (formatted) hard disk drive. Users can expand the system by installing Altos' hard disk drive modules, which include power supplies.

The Altos 2086 can accommodate up to three hard disk drives for total storage of 189M bytes.

Each serial communications board for the Altos 2086 is said to include an Intel 8086 microprocessor running at 8 MHz. Each board has a total of 10 ports. Up to two ports can support synchronous protocols, while one port can be software selected to operate Altos' local-area network, known as Worknet, the company said.

The standard serial communications board is said to include 32K bytes of RAM. Altos is also offering a 128K-byte RAM board that will support X.25 or IBM's Systems Network Architecture (SNA) protocol software.

Each Altos 2086 will be shipped with user and field service diagnostics, the company said. The Altos 2086 is also said to feature remote diagnostics capability.

According to Altos, the system will support IBM 3270 and 3780 bisynchronous and 3270 SNA/Synchronous Data Link Control communication for mainframe communications.

In a 20-user configuration, which includes 2M bytes of RAM, a 63M-byte hard disk drive, a 1.2M-byte floppy disk drive, a 60M-byte tape drive and an Altos terminal with a monochrome display, the Altos 2086 will sell for $19,990.

More information is available from Altos, 2641 Orchard Pkwy., San Jose, Calif. 95134.

FCC to revise equal access

WASHINGTON, D.C. — The Federal Communications Commission last Friday was expected to revise its equal access implementation rules for the seven regional holding companies. The revisions would require the divested Bell operating companies to divide default long-distance traffic among all competitive long-distance carriers, not just route it to AT&T.

This plan, which has already been adopted by the companies that comprise U.S. West, one of the regional holding companies, has received the endorsement of the U.S. Department of Justice [CW, April 22].

The original terms of the AT&T divestiture and the FCC implementation guidelines required that default traffic be routed to AT&T from customers that have not yet selected a long-distance carrier in areas where equal access has already been implemented.

Under the U.S. West plan, customers are twice asked to fill out ballots for their carrier preference. If they do not select one, they are ultimately assigned to a carrier according to a percentage allocation formula that reflects the ballots filed in the phone exchange that is being converted to equal access.

The FCC last week was also expected to make other changes in the equal access implementation rules in an effort to make them more equitable, according to the FCC staff.

WHAT DOES THIS REPORT MEAN TO YOU?

Space occupied by data sets inactive for 30 days
Savings over full volume dump

This report means that ABR puts you in control of your system whether it drives 16 or 160 disks.

WITH ABR YOU:
- Identify and free-up inactive data sets
- Save by dumping only data sets which change
- Track and recall backups automatically
- Provide the security of current backups
- Install program in minutes with a simple linkedit

SEND FOR YOUR FREE DASD MANAGEMENT REPORT PROGRAM
(Contains tape and brief easy-to-follow guide.)

The only thing more convincing than seeing your own data produced in report form with such ease and accuracy is the factual measurement data you can provide to those whom you would influence and persuade.

ABR provides an efficient and easy-to-use method of managing the space on direct access volumes, regardless of the size of your system. And this report will help you prove it.

AT&T challenge to IBM: Much talk, little action

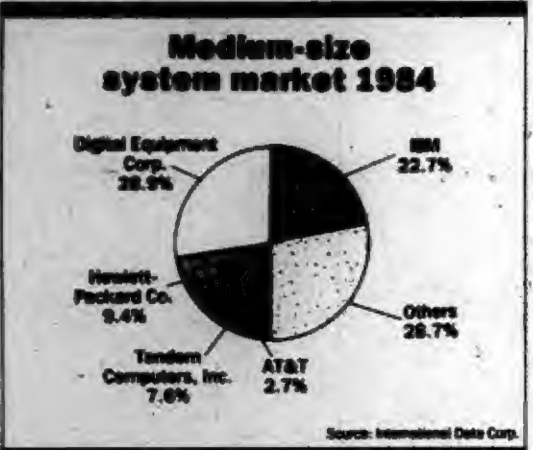
By Paul Korzeniowski
CW Staff

King Kong vs. Godzilla.

It was generally felt last year that the data processing world would be rocked by a battle royal between IBM (King Kong) and AT&T (Godzilla). Freed from its regulatory chains Jan. 1, 1984, AT&T has possessed the financial and technical muscle needed to loosen IBM's stranglehold on the computer industry.

Since that date, AT&T has introduced three computer lines: a 3B line of multiuser Unix systems in March 1984; the AT&T 6300, an IBM Personal Computer-compatible microcomputer, in June 1984; and the Unix PC in March 1985.

Medium-size system market 1984



Source: International Data Corp.

To date, no AT&T computer product line has challenged the market leaders. As a result, a number of predictions have been tempered, and some computer industry interpreters are beginning to doubt that the communications giant will ever pose a Godzilla-like challenge to the industry's King Kong.

"Certainly, AT&T's performance thus far has been disappointing," observed Gwen Peterson, director of business computer system industry service at Dataquest, Inc., a market research firm in San Jose, Calif. "The only business sector that has made volume purchases of AT&T products is [that of the] former Bell operating companies. Because of AT&T's assets and the technical achievements at Bell Laboratories, many people expected AT&T to quickly sell a lot of computers.

"Expectations were also great in the early 1970s when [Exxon Corp.], with a lot of cash, entered the high-tech field," she added. "Yet Exxon never sold many systems."

Exxon recently abandoned its computer sales and sold its office automation line to Harris Corp. [CW, March 4].

"AT&T will need a lot of time before it learns how to sell computer equipment," Peterson explained. "The company has already learned that selling computers in a competitive environment is much different [from] operating a monopoly."

Industry observers explained that a primary difference is marketing. In the face of little or no de facto competition, there is no pressing need to market a product intensely. When there is stiff competition, marketing often determines a product's success or failure.

AT&T's products have been technically sound, but the company has not formulated a coherent marketing plan, according to Richard Ross, director of industry services at the Gartner Group, Inc., a market research firm in Stamford, Conn. The communications giant appears to be marketing its products as competitors to IBM products.

"AT&T is not competing with companies like [Digital Equipment Corp.]," maintained James Sullivan, senior analyst at Yates Ventures, Inc., a Los Altos, Calif., market research firm. "DEC is too small. AT&T has the resources to compete with IBM. The communications company is used to being No. 1 and is striving to be No. 1 in the computer industry."

AT&T's success hinges on MIS managers' acceptance of its products. A sampling of MIS managers by *Computerworld* found few interested in AT&T's systems.

"AT&T's reputation works in a negative way," explained Steven Radice, director of information services at the Florida Federal Savings and Loan Association in St. Petersburg, Fla.

"When I think of AT&T, I think of a complex bureaucracy that is new in the computer field," Radice noted. "IBM is also a bureaucracy, but I know how to work with it. There is no reason for our company to be interested in AT&T products."

To garner interest, analysts suggested that AT&T must market its principal offering, Unix, and primary strength, an ability to integrate voice and data.

Often, product awareness does not translate into product sales. Although MIS managers were quite aware of Unix, few had considered purchasing it.

"I see no reason to move to Unix and be in the forefront of technology," Radice noted. "With our current investment in MVS training and software, Unix would have to offer us significant benefits for us to ever consider purchasing it."

Rather than substantial benefits, Unix offers a number of problems, according to some. "Unix does not have file-locking and security features found in other operating systems," Dataquest's Petersen explained.

Personal computer sales (units)

Product	1984	1985
IBM Personal Computer	880,000	1,050,000*
Apple Computer, Inc. Macintosh	275,000	420,000
AT&T 6300	33,000	70,000
AT&T Unix PC	—	18,000

* Includes anticipated IBM PC2

Source: Infocorp

Some of these deficiencies were overcome on the version that runs on the Unix PC. However, there is some question concerning how compatible

See AT&T page 9

An ideal AT&T?

You wake up tomorrow morning and your life has changed. You are in charge of AT&T's Information Systems division. Your job is to turn the communications company into a major player in the computer industry. What would you do?

Richard Ross, director of industry services at the Gartner Group, Inc., a market research firm in Stamford, Conn., had three suggestions. First, he would cut AT&T's work force by 25%. Next, he would revamp all factories so the company could truly become a low-cost producer.

"Also, I would drop out of the desktop market for the short term," he said. "AT&T is just not ready to really compete in that market. It should concentrate on the communications and network management markets, businesses that it is familiar with. AT&T would then be able to use that success to enter the desktop market."

Gwen Petersen, director of business computer system industry service at Dataquest, Inc., a San Jose, Calif., market research firm, suggested a directly opposite tack. "First, AT&T has to be successful in the desktop market," she said. "The corporation should concentrate on departmental microcomputers, systems that tie into a [private branch exchange] or other communications systems. That area — integrating voice and data — is where its advantages lie."

James Sullivan, senior analyst at Yates Ventures, Inc., a Los Altos, Calif., market research firm, would round out AT&T's product line. He recommended a microcomputer that runs AT&T Unix and Microsoft Corp.'s MS-DOS operating systems. "To an extent, the AT&T 6300 offers Unix and MS-DOS capabilities, but it's not full-featured," he stated. Other recommended products include a mainframe that runs Unix and a 6300-type machine with a $3,000 to $5,000 price tag.

Unix, graphics attract corporate users to AT&T systems

By Paul Korzeniowski
CW Staff

Few are the large corporations that have embraced AT&T's computers. Those that have been lured to the AT&T camp have often been attracted by features like Unix or the graphics capabilities of AT&T's 6300 microcomputers, according to users interviewed recently.

The Maybelline Co. in Memphis, a division of Kenilworth, N.J.-based Schering-Plough Corp., is somewhat of a Unix pioneer among large corporations. While most large companies have shied away from the operating system, the maker of Maybelline cosmetics began working with Unix two years ago.

The move to Unix was made after a careful examination of other small system alternatives, including IBM's System/36 and 38, according to Richard Whatley, vice-president of systems planning at Maybelline. "We found that Unix systems offered more features than the System/36 or 38 offered," he said.

> ”
>
> *'AT&T's salespeople have been very knowledgeable, and the systems have proven to be reliable.'*
>
> **— Richard Whatley**
> **Maybelline Co.**

At first, Unix applications were run on Tandy Corp. TRS-80/16B microcomputers. Last year, the division needed a more powerful piece of Unix hardware to power a new order entry application, according to Whatley. "Just as we were expanding our use of Unix, the [AT&T] 3B2 line was introduced," he said. "Since the hardware came from the inventors of the operating system, the 3B2 line seemed like a logical choice to us."

Whatley's division had been true to Big Blue, using an IBM 4381 mainframe as a departmental processor, a number of IBM Personal Computers and an IBM 3084 mainframe that ran corporate applications. The division has now purchased six 3B2s and several AT&T 6300 microcomputers.

Thus far, the Maybelline division has no regrets about its move to AT&T. "AT&T's support has been excellent," Whatley said. "If there is ever a problem, we have an 800 number to call. AT&T's salespeople have been very knowledgeable, and the systems have proven to be reliable. AT&T's support has been better than IBM's support,"

Last year, Charter Medical Corp. of Macon, Ga., was looking for a medium-size, multiuser, multitasking system to run its purchase order system. "We examined a number of systems before choosing AT&T 3B2," Anne Mullendore, director of purchasing said. "The chief reason we chose an AT&T system was that the company promised to help us design our software."

The medical corporation's DP staff consists of 70 people working with IBM's MVS on an IBM 3083 mainframe and four people responsible for 3B2 applications. Today, the two systems work separately, but Mullendore predicted that soon they would be linked.

J. J. Kenney, Inc., a municipal securities firm in New York, wanted to integrate its Perkin-Elmer Corp. 3200 superminicomputer with personal computers. The company volunteered to be a beta site for the recently released AT&T Unix PC. "We liked the product's multitasking and windowing capabilities," a J. J. Kenney spokesman said.

Integrating micros and the supermini has proven helpful, but the integration is not complete. "We have to recompile personal computer programs so they will run on the larger system," the spokesman said.

Mediq Information Systems, Inc. in Pennsauken, N.J., needed powerful personal computer graphics capabilities for its radiology applications.

"The microcomputer had to support 64 shades of gray, which are needed to read certain X-rays," said William Adams Jr., the company's president. "The system can store digitized X-rays on a 3B2," Adams added. "The 3B2 is tied into an [AT&T] System 75 [private branch exchange], allowing a user to download the pictures to a 6300."

AT&T

from page 8

that version of Unix is with previous versions.

The gradual merging of voice and data functions may not prove beneficial to AT&T. "A number of companies have merged voice and data capabilities," Gartner's Ross maintained. "Telephone functions are being usurped by the data processing department, not vice versa."

For Godzilla to meet King Kong, these roadblocks have to be overcome. "AT&T will not be a major player in the computer industry for the next five years," Ross predicted. "It is questionable whether or not it will be a major player in 10 years."

IF YOU DON'T BUY YOUR NEXT PRINTER FROM BDS, DON'T LET YOUR FRIENDS SEE THIS AD.

Why? Because you don't want *the gang* to think you've been playing football without your helmet.

BDS, the world's largest integrator of Dataproducts printer mechanisms, has temporarily slashed prices by 20%* for new customers. This introductory offer is designed to show you why thousands of customers and over 10,000 installations have made BDS the world's largest supplier of Dataproducts-based plug-compatibles.

Sure, it's easy to confuse some of your non-technical friends when you talk computers. LANs, communications protocols, and multiprocessor load balancing even stretch the brain of your above-average wizard. Not so with your heavy duty-cycle, run-em-year-in-and-year-out, industrial-strength printers.

A few weeks ago, it would have been really tough to justify to your old high school chums why you paid 30-50% more than you had to. Through June 30, 1985, you'll be saving more like 40-69%. Not only do non-BDS customers pay more for the identical printer mechanism from DEC, DG and HP, but they get much less intelligent printer controllers and fewer options in the process.

Oh? You think you can still snow old "Stinky" Seligman or "Hotrod" Herbie on how smart your printer electronics has to be? Try this on for size: Just ask your computer salesperson to help you move the printer s/he sold you to a competitor's system. That sales rep will look at you as if you weren't from this planet. Not so with your BDS salesperson.

With a simple field modification, your BDS printer can be moved from your HP to your DG to your DEC or even to your IBM system. Optionally, it can talk to your system from as far away as 1500 feet. *Anybody* can understand this stuff.

And like we said, thousands of IBM, DEC, DG and HP customers have purchased over 10,000 plug-compatible printers from BDS. Everything from 55-cps daisy wheel printers and 200-lpm dot-matrix printers (the kind that don't break down every week) to heavy-duty 2000-lpm band printers (the kind IBM customers prefer).

As you can see, BDS controllers and Dataproducts print mechanisms, along with nation-wide service, aren't so tough to understand. Even for non-technical chums.

So if you don't want your friends thinking their *best and brightest* is the *worst and stupidest*, call BDS today. Or deep-six this cotton-picking ad. Fast. Because if your non-technical friends can even understand this stuff, chances are your boss can, too.

SETTLE from page 1

David Sturtevant, communications director for Adapso, a trade association representing 750 firms engaged in software and services, said the settlement was not forced by financial constraints and that Adapso had been willing to press the issue through a trial. However, legal communications provided to *Computerworld* indicated that Adapso had established a $10,000 budget for the case and was actively seeking a settlement.

Sturtevant declined to say how the alleged copying was discovered, but it was learned that Adapso had obtained internal Wilson Jones documents.

As part of the settlement, according to the statement, "American Brands and Wilson Jones share fully Adapso's and Micropro's conviction that software products should not be duplicated improperly, and they have agreed that appropriate procedures will be instituted to [ensure] against such improper duplication."

Adapso spokesman Sturtevant said Wilson Jones agreed to pay a cash settlement to Micropro, but he declined to specify the amount.

The suit, filed in Federal District Court in Chicago, had asked for damages of $225,000 and the return of any profits earned as a result of the alleged copying.

> 99
>
> *A spokesman for American Brands, Inc. said steps will be taken to ensure its operations have 'a much higher level of awareness' about software protection issues.*

Bob Bukeyeser, spokesman for American Brands, a Fortune 100 conglomerate with revenue of $7 billion, said steps will be taken to ensure its operations have "a much higher level of awareness" about software protection issues. He said he was not aware of any disciplinary action taken as a result of the lawsuit.

Although the statement did not say whether or not Wilson Jones management was aware of the practice, Bukeyeser said that "at senior levels nobody knew of it, and nobody agreed with it." Wilson Jones sells office equipment and supplies and at one time operated a business computer division that held membership in Adapso from April 1968 to February 1984.

The suit was a dramatic highlight to a broader education campaign designed to make companies and institutions aware of the illegality and penalties of unauthorized software duplication. Adapso has mailed out materials and offered advice on how companies and others can institute antipiracy policies.

Since the campaign was announced in January, Sturtevant said, Adapso has received 4,700 responses to its mailings, and more than 100 companies have provided Adapso with copies of antipiracy policies that have been developed or implemented.

Kodak Unix-based publishing system out

ROCHESTER, N.Y. — Eastman Kodak Co. announced an AT&T Unix-based electronic publishing system — the company's first thrust into the office publishing market — and the development of an image management system.

The Kodak Ektaprint Electronic Publishing System (Keeps) is said to automate the composing, printing and publishing of near-typeset-quality documents that merge text, business graphics and images.

The most basic Keeps configuration includes a Sun Microsystems, Inc. stand-alone graphics workstation, 42M bytes of storage on a Winchester-type 5¼-in. hard disk and a Canon, Inc. LBP-CX laser printer. The system runs under the University of California at Berkeley Version 4.2 of the Unix operating system, the vendor said.

Options include a Sun Microsystems text controller for word processing, which can support up to eight Esprit Systems, Inc. on-line Ascii text entry terminals; an Imagitex, Inc. graphics scanner; a file server node; a 1,200 bit/sec. telephone data modem and a printer that interfaces directly with the text cluster computers or individual graphics workstations to provide ready access to proofs.

The system can allow file transfers from a customer's existing 7-bit Ascii word processing system or personal computer into the Keeps system, the vendor said. Users may change the type or size of fonts or other typographical elements as well as the size, proportion and position of graphics. Users may also preview how those changes will affect the document and how the document will look when printed out.

Software includes Interleaf, Inc.'s Workstation Publishing System for composition, Marc Software's Wordmarc word processing package and Kodak's proprietary software for linking the products and programs, the vendor said.

The system, the base configuration of which costs $50,000, is geared

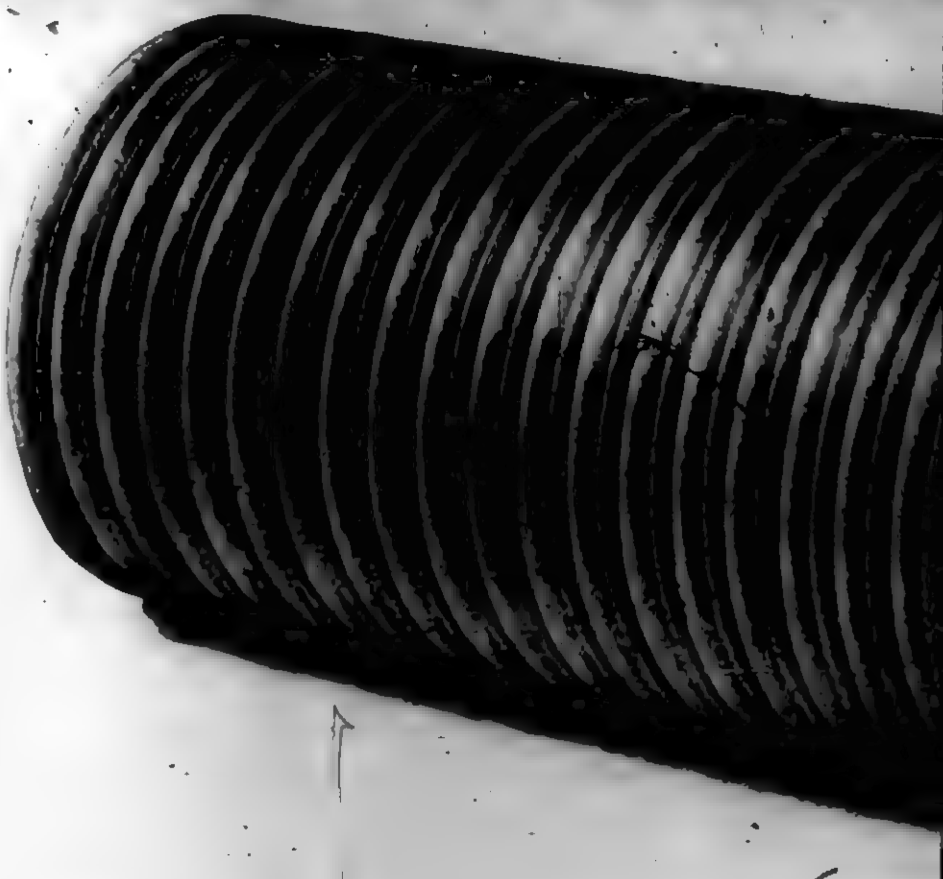
For fast relief



Most computer tapes are a pain.

Because they're abrasive.

They're rough on tape drive read/write heads. Pass after pass, they wear them down.

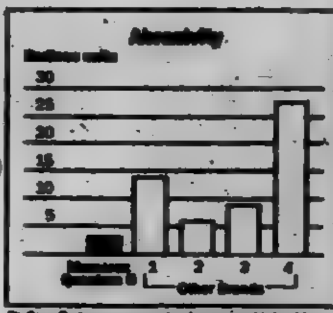
And tough on you because of the problems that result from worn heads. Like erratic signal levels. Dropouts. And, worst of all, data loss.

How do you relieve these headaches? By making sure they don't happen in the first place.

By asking for the edge. The Memorex edge.

Memorex has the edge on the competition because our computer tape is the least abrasive available. We take the pains to make it right. Our proprietary "thin coating" oxide formulation is so carefully pre-mixed, dispersed and surfaced that it's uniform to ten-millionths of an inch. So there's little to bump your head.

That coating edge also makes possible the highest output at high recording densities. So your data is safe, even in extreme situations.



[illegible]

Reagan tax reform proposal could raise hardware costs

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — President Reagan last week unveiled a major tax reform proposal that would slightly increase the cost of purchasing or leasing computer hardware, because the proposal would repeal the 10% investment tax credit for equipment.

James F. Benton, executive director of the Computer Dealers and Lessors Association (CDLA) here, confirmed that third-party lessors are likely to pass the increased cost from the loss of the tax credit along to customers. Likewise, users with tax liabilities who purchase hardware will lose that credit, thus increasing the after-tax cost of the computer by 10%, he said.

Explaining the tax reform proposal, Reagan said, "We are determined to cut back on special preferences that have too long favored some industries at the expense of others. We would repeal the investment tax credit and reform the depreciation system. Incentives for research and experimentation, however, would be preserved."

Reagan administration officials said repeal of the tax credit is needed to eliminate the investment bias in favor of equipment that qualifies for the credit and to eliminate the complex rules that define what is and what is not eligible for the credit.

Besides repeal of the investment tax credit, key provisions of the proposal include the following:

- The top corporate income tax rate would be reduced from 46% to 33%.
- The existing 25% tax credit for increased investments in research and development would be extended for an additional three years (until Dec. 31, 1988) and would be revised to target research that is likely to result in technological innovation.
- The maximum effective rate of taxation on capital gains would be 17.5%, compared with 20% under existing law.
- The accelerated depreciation system enacted in 1981 would be replaced with a Capital Cost Recovery System (CCRS) that is indexed for inflation. Computers, depreciated in five years under existing law, would be placed in Class 2 of CCRS, which provides cost recovery in five years at a rate of 44% in the first year and 44% of the remainder in each subsequent year.

The good news, CDLA's Benton said, is that the Reagan administration not only abandoned its previous plan to increase the depreciation on computers from five years to eight years, but it also revised the depreciation system so that roughly 79% of the investment can be depreciated in the first three years (assuming a 5% inflation rate).

See REFORM page 12

KODAK

from page 10

to office or in-plant environments within Fortune 500 companies, the vendor said. It will be marketed initially in Kodak's regional marketing centers, including New York; Washington, D.C.; Chicago; Houston; and Los Angeles and will be available nationwide in 1986, a spokesman said.

The Keeps system that is being marketed at this time includes Version 1 of the company's software. The system that will be available by the end of the year reportedly will include Version 3 of the software, which will add functions such as graphics scanning, scanned image editing and multicolumn capabilities.

Kodak also preannounced its Kodak Image Management System (Kims) that is under development. The system is said to convert passive microimage files into active records that users can annotate as required. The Kims system — which will cost in the neighborhood of $460,000 — will be targeted at businesses with large data processing and document record-keeping requirements, like insurance and engineering firms, financial institutions and government agencies.

> *The Kims system — which will cost in the neighborhood of $450,000 — will be targeted at businesses with large DP and document record-keeping requirements.*

The system, which will be based on one of Digital Equipment Corp.'s VAX series machines under DEC's VMS operating system, is part of a joint development effort between Kodak and DEC, a DEC spokesman said. In its final form, the system's components will be networked on a Decnet-style local-area network and will be able to access data from IBM mainframes, a Kodak spokesman added. The system's autoloader machine is said to store 250 microfilm cassettes, or 3½ million pages of microfilm.

More information is available from Eastman Kodak, Rochester, N.Y. 14650.

of head aches.

Plus, we house every roll of our tape on our SuperReel™ II. With its unique I-beam construction and ultrasonically weld-d flanges, SuperReel II is 90% stronger than conventional reels. So your tape—and your data—has an extra edge of safety during handling and operation.

A lot of work. But well worth it for a tape that's tested end to end, track by track. And warranted for 25 years. All of which will come as a great relief to you. And your heads.

MEMOREX

MEMOREX IS THE EDGE

MADONNA

from page 1

In its May 20 verdict, the jury agreed with Madonna's charge that NCR configured his Model 499 business system with a cassette tape unit that the vendor knew was insufficient in both capacity and access speed.

But in the same verdict, the jury also rejected Madonna's complaint against Lincoln Marini and Associates, Inc., a Fresno, Calif.-based program developer that was named as NCR's codefendant in the suit. When the plaintiff filed his legal action in May 1979, he accused Lincoln Marini of breaching its contractual obligations to tailor NCR's Construction Management System (CMS) package to Madonna's individual specifications.

The jury, however, absolved Lincoln Marini of any negligence in the case and blamed Madonna's own mismanagement for the programmer's failure to rewrite CMS' four application modules effectively, according to Wendt.

The jurors also accepted NCR's contention that the vendor "had, in fact, performed its contract with Madonna," Wendt said.

But in an accompanying decision that the defense lawyer labeled "inconsistent," the jury found the systems maker guilty of intentionally overstating the 499's technical capabilities, particularly those of its cassette unit.

"[NCR] didn't know or care whether the system was going to work for Madonna's construction company," according to the plaintiff's attorney, Marty Tangeman. "[NCR] decided a [cassette-equipped 499] was the right machine for my client because [it] had a software package for it, and [it] didn't have a package for any other machine. So [NCR] went ahead and sold it to him."

To support his charge, Tangeman cited NCR's alleged failure to analyze Madonna's systems requirements. "According to trial testimony, the first thing a vendor does before it configures a customer's machine is perform a systems analysis and survey the user's needs," he said. "Nothing of that sort was ever done in this case by NCR."

Evidence of NCR's alleged disregard for systems requirements is also present in the company's own internal sales documents, which suggest that cassette-based 499s are aimed at much smaller users than Madonna's firm, Tangeman said in court papers.

Such revelations apparently played a key role in convincing the jury that NCR had intentionally misrepresented the 499's capacity. Under California law, any business that knowingly deceives customers about its products or services becomes liable for punitive damages, which in NCR's case totaled $5.2 million.

In his complaint, Madonna portrayed his cassette-based 499 as a system so ill suited to its intended application that it reportedly prevented him from producing any job-cost reports for all of 1978. "For a construction company, job-costing reports are an essential management tool," Tangeman explained. "They're the only way a contractor can tell where he's having problems with a construction project and what he should do to correct them."

Even after 1978, when the reports finally became available, the system's storage capacity remained so restricted that it was unable to hold all the job-cost information Madonna needed to run his business effectively, Tangeman said.

Between 1978 and 1982, the absence of reliable job-cost data reportedly saddled Madonna's once-profitable firm with $7 million in losses, the defendant claimed.

Half a million in damages

Although Madonna sought restitution for the full amount, "the jury could pinpoint only half a million dollars in direct damages," said Tom Beisman, a Los Angeles-based consultant who closely followed the case.

Even so, NCR attorney Wendt termed the judgment "a clear example of a jury gone amok. We feel this type of punitive damage is becoming all too common in California and is beginning to hurt the business community."

Wendt also blamed Madonna's claimed business losses on the user's own mismanagement, rather than on the purported shortcomings in NCR's system, and disputed allegations that the 499's cassette module was too small for the construction company's volume.

REFORM

from page 11

Several of the provisions are more favorable to high-technology industries than the proposal made by the U.S. Department of the Treasury last year. For example, the Treasury Department plan would have taxed all capital gains as ordinary income, indexed for inflation, but that proposal was strongly opposed by venture capitalists and electronics firms.

William G. Moore Jr., chairman of the American Electronics Association, said the group will work aggressively for passage of the legislation and was particularly pleased by the capital gains tax cut and the R&D tax credit provisions.

Charlotte LeGates, spokeswoman for the Computer and Business Equipment Manufacturers Association (Cbema), said Cbema members had mixed reactions to the Reagan plan. On one hand, she said, they endorse the general concept of tax reform to reduce their high effective tax rates and support retention of the R&D tax credit. On the other hand, she said, they are very troubled by a complex provision that provides for the transition from the existing depreciation schedules to the new CCRS, which, she said, may increase taxes for the computer industry.

Microrim implements user suggestions in Rbase upgrade

FIRST USER

By Paul Korzeniowski
CW Staff

The early users of Microrim, Inc.'s Rbase 5000, a data base management package that runs on the IBM Personal Computer, feel like proud parents. The users had worked extensively with Rbase 4000 and helped to conceive the new package.

"It didn't take me long to get Rbase 5000 up and running," noted Catherine Curtis, vice-president of research at Issaquah Group, Inc., a consulting and software firm in Orange, Calif. "I had sent Microrim a number of recommendations, and I wanted to see if they had been incorporated into the new product."

Curtis and other early users, all of whom received complimentary copies of the package, reported that most of their recommendations had been included in the new product. The package kept basic Rbase 4000 commands and functions but added a number of features.

Some new features centered on Rbase 5000's integrated report writer, which sold separately with Rbase 4000.

> 'A user can still customize the program, but he won't be able to change portions of the code that shouldn't be changed.'
>
> — Catherine Curtis
> Issaquah Group, Inc.

"With Rbase 4000, a user could only access one field in a report through a Lookup function," Curtis said. "With 5000, a user can access two or more fields and can combine a number of fields in a report."

Tom Mahon, industrial engineer at Construction Engineering Research Laboratories Corp. in Champaign, Ill., added that he is now better able to qualify data. For example, he can specify records with dates after January 1, 1985. "We can work with up to 10 qualifiers," he said. "Frequently, we use six or seven qualifiers."

John Harris, senior systems analyst at the personal computer support center for the city of Seattle, remarked that the report writer now supports subtotals and has made it easy for a user to set page formats.

Other enhancements consist of the package's ability to work with numbers. "There are extensive breaking and subtotal functions that allow you to develop accounting applications," Curtis claimed. "I would never use Rbase 4000 for an accounting application."

The experienced users have worked with Rbase 5000 to develop stand-alone applications for both themselves and end users. "We have 750 rifle range training facilities," noted Mahon whose company furnishes consulting services for the U.S. Army Corps of Engineers. "We have written a number of applications to schedule training times, track ammunition and automate other administrative functions."

Seattle's Harris wrote applications to track health organization clients, consultant services used by various departments and the status of a number of city contracts.

Issaquah's Curtis claimed that Rbase 5000 features enhanced applications development capabilities. "After you have written a program, you can designate certain portions of the code so a user cannot alter them," she said. "A user can still customize the program, but he won't be able to change portions of the code that shouldn't be changed. This feature is a valuable tool for an MIS manager who wants to retain some control over an application."

In addition to being a powerful tool for applications developers, early users said the package was simple enough for novices. Rbase 5000 features Application Express, which generates an application from a user's menu-driven input. "Novices seem to be comfortable with words like Select, so Rbase's command language is much clearer than that of other data base packages," Seattle's Harris said.

The users had worked with other data base management packages before deciding to use Rbase. "I worked with [Ashton-Tate's] Dbase II and found that it was unreliable," Curtis said. "There were a lot of bugs in the product." Harris added, "It would take 20 minutes for Dbase II to run an application that would run in a few minutes with Rbase."

Since many of their suggestions had already been incorporated into Rbase 5000, users cited few needed enhancements. "It would be helpful if Microrim's Clout (a natural language interface) was more closely integrated with Rbase 5000," Curtis concluded. "If it were, a developer could write applications that work with an English interface. Now, Clout can only be used to query a data base."

WHITESMITHS, LTD. 370 COMPILER

NOW YOU CAN RUN BOTH
C AND PASCAL ON IBM MAINFRAMES

FEATURES:
- Full implementation of the C programming language for the IBM 370/43XX/30XX
- Supports full ISO Level 0 Pascal, extended to support separate compilation
- Uses standard IBM tools to facilitate debugging in the standard IBM save area layout
- Compatible with the full range of Whitesmiths' compilers (PDP-11, VAX, 68000, 8080, and 8086)
- Provides optional cross support for MS/PC-DOS, CP/M-86, CP/M68k, and CP/M-80
- Runs under all versions of OS (VM, MVS, SVS, MVT, and MFT)
- Includes unlimited use of libraries in binary form
- Runs interactively under TSO and CMS
- Direct EBCIDIC support

Life on the hot line provides long-distance debugging

Most problems solved in 15 to 20 minutes

By Charles Babcock
CW New York Bureau

The phone rings.

'Hello, John? That bug was supposed to have been cleaned up in that version. Let me check engineering.'

It rings again, almost immediately.

'What version are you using, 83.1? Uh-huh. That's a known thing. There's a way to turn that off.'

So goes another day in the life of hot-line specialist Patricia O'Brien, one of 12 technical assistants at the Princeton, N.J., offices of Martin Marietta Data Systems. O'Brien answers hot-line calls on Martin Marietta's Ramis II, a data base management system, report generator and fourth-generation language package. As a specialist on how the software interfaces with IBM's IMS product, she gets some of the toughest calls.

"Sometimes, people are upset when they call in, but most are pretty reasonable," O'Brien said in a recent interview at her office. In fact, once, when she resolved a particularly nettlesome problem, the caller sent her a bunch of roses.

Another Martin Marietta technical assistant, Irving B. Kantor, appeared unflappable as he listened for several minutes to a caller's problem.

"'Define' is already active because you activated it before you went through the files," he advised the caller.

Most calls are handled on the spot in a 15- or 20-minute consultation. A few, said Sue Goldberg, the Martin Marietta hot-line manager, can take most of an afternoon.

The hot-line technical assistants have a full library of reference manuals to back up their hunches on what may be wrong in a user's environment, and they frequently refer to the monthly engineering bulletins that are sent out to users advising them of special conditions and potential bugs.

Quick response helps

But there is no substitute for the knowledge in their heads or at their fingertips. It is the immediacy of their responses that helps convince callers that there is help at the other end of the hot line, Goldberg said.

Goldberg, 40, is a six-year veteran of manning hot lines, and when the traffic is heavy at Martin Marietta, she sets aside whatever she is doing and picks up the phone herself.

After identifying one caller's problem, she counseled, "I don't think we can zap it [do a quick change to the program code over the phone]. That's a problem that's been in the system for many releases."

A concern Goldberg shares with other hot-line managers is that "it's tough to talk to people only when they have a problem," she said.

"You can't expect a person to answer a phone eight hours a day. You lose empathy because you're not talking face to face," said Kenneth M. Schultz, manager of client services at Management Science America, Inc. in Atlanta.

Once, Goldberg recalled, she believed she was not making any headway on solving a problem with a caller and asked if she could talk to his systems programmer. "I am the systems programmer," he told her.

Such incidents underline the difficulty of long-distance dealings and "make you feel about this tall," Goldberg said, indicating a small amount with her hand.

On the other hand, some callers whom she has helped before, knowing her fondness for chocolate, include a one-pound bag of M&Ms when they send her a program dump.

In looking for people to staff the Martin Marietta hot line, Goldberg said, she looks for complementary personalities, and users frequently deal with the technical assistant of their choice.

Some assistants come out of other support roles in the firm, and some have programming backgrounds. But if an applicant tells Goldberg he loves to sit at a terminal and write code, "you know you've got the wrong person," she said. "You must be able to listen to people."

PROBLEMS

from page 1

"We asked one caller to copy the diskette he was using and send it to us. He went straight to the Xerox machine and copied it," Schultz said.

Troubleshooting is as much identifying the problem as it is finding the fix, Wright said. "It's kind of a mutual process. We are probing for information that the client may not feel is useful, but we have to put the pieces of the puzzle together," he said.

Frequently, the caller thinks he has encountered a bug in the software, and all three managers acknowledged that no major software package goes out bug-free. But "almost every environment is unique in some sense. The hardware or disk drives will be different," Wright said. Changes in the operating system, releases of the software or flaws in the way the package is installed can all lead to unexpected kinks, he said.

> *There remains no substitute for close, two-way communication.*

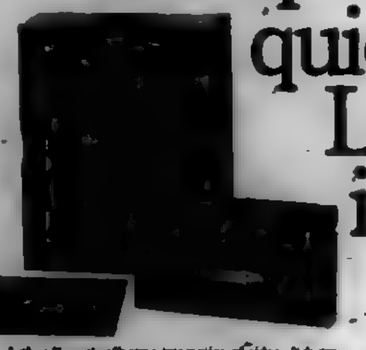
Although problems vary with the product, the three managers agreed to a large extent on the things a caller should be prepared to tell a hot-line troubleshooter. These include the following:

- What release of the product is being used? An eight-year-old package like Martin Marietta's Ramis II, with a fourth-generation language, data base management system and other components, has averaged two releases a year. Each has its modifications and idiosyncracies, and these are logged in bulletins and reference manuals, Goldberg said.
- What operating system is it running under? What version of the operating system and compiler is being used? Complicated software packages can have different idiosyncracies under different operating systems, Schultz said.
- If you are getting an error message, what is it? What is the exact wording? What is its number? Is it a message from the program or from the operating system?
- What part of the package are you using? A frequent cause of a program not doing what it is expected to do is the user following directions for one component while working in another, the three managers noted.
- How much memory are you using? If you are running a big application program, has it worked before? "Something that works with 10,000 records may not work with 100,000," Goldberg said.

Even after these questions have been answered, it can still be difficult to isolate the problem. In that case, all three vendors either ask to log on to the user's system through their own terminals and modems or try to simulate the problem on their own system.

At MSA, troubleshooters can duplicate problems under two different operating systems running on an IBM 3081 or 3033 mainframe, Schultz said.

A last resort is to ask the user to dump the program to the printer and send a printout to the troubleshooter.



Get up to speed quickly on Lotus — including macros.

Arthur Young's effective instruction of video, diskette and reference guide brings you up to speed quickly.

Call now for free trial.

The Lotus™ proficiency course.

Learn how to set up Lotus spreadsheets; enter, save and retrieve data; correct mistakes; use formulas and math functions; create graphs; print, and set up and query a database.

Courses for VisiCalc® and Multiplan® are available, too.

The Lotus Macros and Functions for Advanced Users course.

Learn how to set up and use Lotus programming macros; create graphs and perform advanced math functions (min., max., payment, etc.); perform file operations, worksheet status commands and database functions.

Free trial offer.

Send no money now. Take advantage of this special offer by returning the coupon or calling today. Offer ends August 31, 1985.

Now available: Symphony™ training.

Learn how to create windows, graphs and databases; build spreadsheets; and create and edit documents.

Private-sector computer crime bill faces fire at hearing

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — Rep. William J. Hughes (D-N.J.), chairman of the U.S. House Subcommittee on Crime, is plowing ahead with new computer crime legislation covering the private sector. But at a recent hearing, he faced criticism from the U.S. Department of Justice about specific provisions of his bill.

Taking the first step in the legislative process, Hughes chaired a May 23 hearing on his bill (H.R. 1001), which would create felony and misdemeanor offenses for computer crimes that produce illegal gains of $5,000 or more in one year and that affect interstate commerce.

Hughes said the U.S. government and the private sector have a dual responsibility in the area of computer crime. "Industry has to develop 'locks' to protect the intangible property in computer systems, and, when a federal interest is involved, the federal government has to provide the laws to prosecute those who break those locks and enter the systems," he said.

Hughes said the bill would restore provisions stripped from his comprehensive computer crime bill last year. In the closing days of the 1984 session, Congress enacted the Computer Fraud and Abuse Act to cover U.S. government computers and certain financial data bases [CW, Oct. 15].

At the hearing, Deputy Assistant Attorney General John C. Keeney said the Justice Department supports the goal but not the specific language of the Hughes bill. For example, Keeney said, the $5,000 financial gain requirement would hamper federal prosecutors because the amount of any financial gain may be difficult to prove.

Hughes responded that the $5,000 threshold was used to trigger federal jurisdiction, leaving lesser crimes to state and local authorities. Hughes said he would "take a second look" at the financial threshold.

Keeney urged that the computer fraud offense be rewritten so that it tracks the well-established mail fraud and wire fraud statutes and not require prosecutors to prove the defendant lacked authorization or that the offense affected interstate commerce.

Hughes

In a more conciliatory tone, Keeney said these and other suggested changes were technical modifications intended to make computer crimes easier to prosecute.

A representative of the Association of Data Processing Service Organizations, Inc. (Adapso) generally supported the Hughes bill but opposed the $5,000 threshold.

"While we understand the reasons for the dollar threshold, such a stated limitation may send the wrong message to 'hackers' and truly professional criminals . . . [by] implying that low-dollar computer crimes are tolerable," testified Adapso member P. Michael Nugent, government affairs counsel for Electronic Data Systems Corp. and representative of Adapso at the hearing.

George M. Minot, senior vice-president of Compuserve, Inc., testified on behalf of the Videotex Industry Association that the Hughes bill should be broadened to include such acts as password theft and attempted computer crimes.

Representatives of the American Civil Liberties Union and the American Society of Newspaper Editors expressed concern that the Computer Fraud and Abuse Act of 1984 may inhibit government whistle-blowers from disclosing computer-stored information about fraud and abuse in federal programs. The law makes it illegal to gain unauthorized access to information stored in a government computer and then disclose the information.

Meet to examine optical memory

TOKYO — Alan E. Bell, optical media researcher at the IBM Research Laboratory in San Jose, Calif., will be the keynote speaker at "The First International Conference in Japan on Optical Memory Technology," on Oct. 2-4 at the Keidanren Kaikan here.

Bell's address on "The Status of Reversible Optical Storage" will discuss both magneto-optic and phase-change technologies.

Seventeen speakers from around the world will discuss various aspects of optical memory technology. The conference is geared to technical, marketing and planning people in vendor and end-user organizations.

The conference fees are $715.50 before Sept. 1 and $795 after that date. The bound copy of the proceedings of the conference will cost $295.

More information is available from Technology Opportunity Conference, P.O. Box 14817, San Francisco, Calif. 94114.

They're keeping RCA Cylix a secret because they don't want their competition to hear about our value-added data communications network. They know that control of fast, accurate data communications is vital to keeping ahead of the pack. And they're delegating the details to us because we assure them better control.

We achieve this control by keeping ahead of the latest technology changes, and maintaining a close relationship with all major carriers. At our central switching facility, back-up equipment assures maximum uptime. And, our Customer Resource Teams stand ready around the clock to address customer needs quickly, before valuable time and data are lost.

The RCA Cylix on-line network offers satellite-based, end-to-end management of your synchronous data communications. Plus, a continuing array of new services, including dial-in asynchronous, to make sure your network is no less than top notch. The result is single-vendor simplicity with no capital investment, available throughout the U.S. and Canada.

To find out more about why RCA Cylix is the best kept secret in data communications, send the coupon or call, 901-761-1177 fast. Before your competition hears about us.

WASHINGTON UPDATE
CW Washington Bureau

Board charges Treasury with failure to seek bids

WASHINGTON, D.C. — A federal appeals board recently ruled that the U.S. Department of the Treasury violated federal law last year when it tried to buy a $4.2 million package of IBM hardware without seeking competitive bids.

The ruling was issued by the General Services Administration's (GSA) Board of Contract Appeals, which settles disputes concerning government computer contracts.

In December the Treasury Department's Financial Management Service sought to buy an IBM 3081 mainframe, 16 IBM 3380 disk drives and eight IBM 3420 tape drives from the Federal Home Loan Mortgage Corp. (Freddie Mac), a government-chartered corporation. Treasury Department officials classified Freddie Mac as a federal agency, and thus could acquire the used hardware as an interagency transfer without seeking other bids.

Amdahl Corp. of Sunnyvale, Calif., which sought to sell its plug-compatible hardware to the Treasury Department, protested the arrangement on grounds that federal procurement regulations require "maximum practicable competition."

In a May 16 decision by the appeals board, Administrative Law Judge Cyrus E. Phillips IV said Freddie Mac is not a federal agency, and thus the Treasury Department should have sought more bids. Phillips also revoked GSA's authorization for the Treasury Department to purchase a computer.

Bomb blast at Berkeley injures student; suspects, motive lacking

BERKELEY, Calif. — Investigators say they have no leads, suspects or possible motives for a booby trap bomb explosion in a University of California computer terminal room here May 15.

The explosion, the second such incident in three years in the same building, seriously injured the University of California electrical engineering graduate student who accidentally set it off. John Hauser, 26, of Richmond, Calif., suffered the loss of three fingers and sustained potentially permanent damage to his right eye when he ignited the bomb by opening the plastic box that housed it. He remains hospitalized in good condition.

"We think this was intended to maim or kill somebody, but other than that, we have no motive," said Sgt. Calvin Handy of the University of California at Berkeley Police Department. The campus police department, a fully authorized municipal force, is working with the San Francisco office of the Federal Bureau of Investigation on the case.

The bomb exploded in a room that housed four terminals linked with one of the Electrical Engineering and Computer Science Department's Digital Equipment Corp. VAX-11/750 minicomputers. Hauser had been working on an IBM Personal Computer for approximately four hours when he decided to open the package at about 1:30 p.m., according to Ruth Toby, the academic department's office manager.

The bomb was contained in a 3- by 6-in. plastic box with a three-ring binder attached to it by a rubber band. Toby said the box had been in the room for several days, and a maintenance employee, assuming it belonged to a student, had placed it on a table next to the IBM micro.

Electrical engineering Prof. Diogenes J. Angelakos suffered less serious hand injuries July 2, 1982, when a bomb exploded in a lounge area on a different floor of the same building that was the site of the most recent incident. Police are investigating a possible connection between the two events.

Congress lifts daily log rule for home micro tax write-offs

WASHINGTON, D.C. — The U.S. Congress recently enacted legislation repealing the strict record-keeping requirements for making business tax deductions for home computers, a provision enacted last year.

In the Tax Reform Act of 1984, Congress required daily logs to show that a microcomputer is used for business purposes more than 50% of the time in order to qualify for business depreciation and tax-credit benefits [CW, July 2]. But legislators and their constituents considered the log-keeping rules for computers and those for automobiles burdensome.

The repeal legislation deletes the word "contemporaneous" from the record-keeping rules and reverts back to pre-1984 tax law. However, beginning in 1986, taxpayers must have "adequate records or sufficient evidence corroborating their own statements" to substantiate deductions or credits, according to the legislative report.

Bulletin board holds status of licenses to U.S. exporters

WASHINGTON, D.C. — U.S. exporters who need to check the status of the Pentagon's review of their export license applications can obtain that information via an electronic bulletin board, officials said recently.

The Export License Status Advisor (Elisa) contains dual-use export license applications that the Department of Defense has received since April 19, as well as general messages about export licensing matters. The department reviews certain high-technology exports destined for Soviet bloc countries.

Elisa is updated daily and requires first-time callers to assign themselves a password that will be required for all later system uses.

NBS invites applications for robotics research grants

WASHINGTON, D.C. — The National Bureau of Standards' (NBS) Center for Manufacturing Engineering recently invited researchers to apply for financial grants for research on robotics and factory communications systems.

NBS officials said grants can be awarded for research in real-time control of robots and workstations, sensory systems, factory floor communications networks, distributed data management on the factory floor, robot metrology, robot vision and sensory modeling, application of expert systems and artificial intelligence to automated manufacturing systems, software engineering tools and quality control issues.

More information can be obtained from Philip Nanzetta, Automated Manufacturing Engineering Facility, Room B-12, Metrology Building, NBS, Gaithersburg, Md. 20899.

VTAM

NETSPY™ is a Network Performance Monitor that runs under MVS and VTAM version 2; it allows users to monitor all or selected VTAM applications.

NETSPY provides response time and traffic statistics per application and per terminal. It provides three levels of response time: last, worst and average. For applications using the SNA definite response mode protocol, such as most TP subsystems including TSO and IDMS, NETSPY provides the network delays necessary for each transaction.

NETSPY displays its monitoring of response times and traffic statistics from a NCCF3270 screen or a TSO command processor. NETSPY makes no modifications to either the MVS or VTAM code nor is it release dependent.

In less than one hour, you can install and start using NETSPY on a FREE 30-day trial. Call (312) 525-6400.

DSS use ranging from modeling to integrating software

By Maura McEnaney
CW Staff

WASHINGTON, D.C. — Users' perceptions of appropriate decision support systems (DSS) range from completely integrated software functions to generic modeling structures.

That was the view of attendees at a seminar on DSS held here recently.

When Union Gas Ltd. was involved in a bitter takeover battle earlier this year, the Chatam, Ont.-based utility company used a 15-year-old financial modeling package to supply top management with crucial information about the takeover.

Today, Michael Blain, coordinator for user services at Union Gas, wants to give end users at his company easy access to corporate data information so that they can use retrieval tools and more up-to-date modeling packages to make business decisions.

At the DSS seminar, sponsored by Digital Consulting Associates, Inc. here, Blain said he was looking beyond modeling packages, considering the implementation of fourth-generation languages and data base management systems at his company.

"I don't think the definition of DSS has really changed much," he said. "Maybe it's just that there are new ways of supporting decisions other than modeling."

Union Gas is currently using an IBM 3081 for decision support and applications development functions, he explained. Currently, the company uses IBM's APL language, ADRS and Informatics General Corp.'s Answer/DB to create mainframe applications for data retrieval and modeling. Union Gas' supply division uses decision support tools to monitor gas levels, forecast sales, run analyses and produce reports and documents for federal reporting requirements, Blain said.

At American Express International Banking, Assistant Vice-President Henry Mariotti said DSS would enable his end users to do various forms of financial modeling. Because it deals only in very high-dollar volume international transactions, the bank's technology needs are not as great as those of a retail bank, Mariotti explained. Recent conversions of international applications from a Honeywell, Inc. DPS 6 mainframe overseas to an IBM 4300 in the bank's New York office has prompted Mariotti to pursue end-user tools such as fourth-generation languages.

For other users at the seminar, the concept of an integrated system that can provide decision support, graphics and data management capabilities is too futuristic.

"We've got to move slowly to bridge the [technology] gap at the company," said Fred Kimball, business systems manager at American Optical Co. in Southbridge, Mass. The safety products and ophthalmologic company purchased an IBM 4381 in December and is just beginning some homegrown attempts to give end users information, Kimball said. Workers at American Optical only recently discovered they could access reports via overnight batch processing. And although that may be considered slow in more automated companies, "it's months sooner than [workers] thought they could get it," he said.

American Optical would consider generic DSS before it approached any kind of integrated solutions, according to Kimball. "There's so much that needs to be done; we've got to crawl before we can walk."

ASM disclaims VDT hazards

CLEVELAND — Add the Association for Systems Management (ASM) to the list of groups rejecting claims that potential health hazards are associated with VDT use.

The ASM, an organization of systems and data processing personnel, recently announced its conclusion that VDTs "pose no known health hazard to workers despite claims of possible adverse effects [associated with] long-term usage."

The association, which represents approximately 9,500 members, said it based its statement on results from research conducted over the past several years by scientists in the U.S., Canada and the UK.

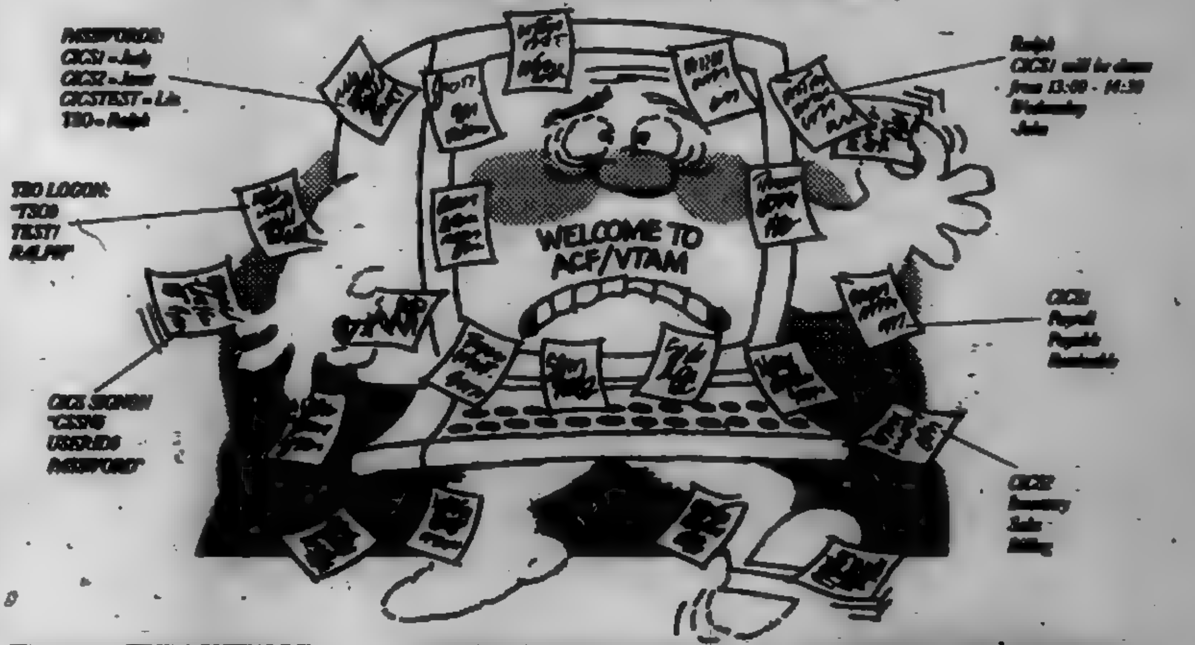
Improper lighting or uncorrected eye problems can be the source of visual difficulties often associated with the use of VDTs, according to the ASM.

Similar statements refuting the possible dangers of VDT use have been issued by the National Institute for Occupational Safety and Health and the American Academy of Ophthalmology, the ASM said.

Nevertheless, 9 to 5, the National Association of Working Women and the Service Employees International Union are among several groups that have criticized VDT use, maintaining that precautions must be taken before concrete evidence on the safety of the machines is available.

Legislation regulating VDT use was filed in more than two dozen states this year. Two states — California and New Mexico — recently adopted purchasing guidelines for state agencies that are acquiring VDTs.

Are sticky yellow notes a major part of your VTAM Network?



Then meet THE NETWORK DIRECTOR™ and start making your VTAM Network:

- More manageable
- More secure
- User simplified

With THE NETWORK DIRECTOR from North Ridge Software there is no need to thumb sticky yellow notes out of the way. At the touch of a PF key THE NETWORK DIRECTOR acts as a front-end to your VTAM-based terminal network, managing user access to all your subsystems—CICS, IMS, TSO, IDMS, CMS, and MODEL 204 to name a few. And it checks with your security package (RACF, ACF2, TOP SECRET, etc.) in advance to see if the user can connect to the subsystem.

THE NETWORK DIRECTOR can then automatically sign-on the user to your subsystems, and if you wish, pass an initial task and initial data, with one touch of a PF key. It provides a personalized menu for each user based on name, location and time-of-day, and automatically tells users when subsystems are up or down. On a global, network-wide level you'll like the help function, message switching and broadcast facility, as well as its security checking and network administration capabilities.

THE NETWORK DIRECTOR is available for IBM Mainframes and requires only VTAM.

For more information please mail the coupon today to North Ridge Software and discover that installation and trial of THE NETWORK DIRECTOR can be as easy as throwing out those sticky yellow notes. Or give us a call at 206/455-9809.

DSS playing larger part in end-user productivity

By Maura McEnaney
CW Staff

WASHINGTON, D.C. — While they continue to play an important role in developing business modeling applications, decision support systems (DSS) today are increasingly being considered as end-user productivity tools, attendees at a recent seminar here were told.

"DSS is a critical subset of end-user computing," John Wark, director of systems software for Walker Interactive Products, Inc. said at a Digital Consulting Associates, Inc. seminar on DSS.

Wark, who conducted the seminar, defined DSS as "interactive systems that allow non-computer professionals to solve unstructured problems." Those problems, he said, can exist anywhere in the corporate structure, permitting DSS to be used in a variety of areas, including inventory control, production scheduling, tax planning, payroll analysis or production planning.

"DSS is no longer a modeling domain reserved for a set of specialists," Wark said. "Everybody realizes there is a need to implement effectiveness in decision making." That effectiveness will come when the end user works with DSS applications through the support of the information center, Wark said.

Aiding the decision maker

Today's DSS are aimed at aiding, not replacing, the decision maker, Wark said. "We can't identify the decisions we are trying to make without [the help of] humans," he said. DSS today must be easy to use, incorporate modeling analysis and take advantage of query and retrieval tools such as fourth-generation languages.

"Whether it is the marketing manager or the chairman of the board, there is a large need to meet the day-to-day needs of organizations," Wark said. Information reporting functions are essential for those day-to-day operations, according to Wark.

Programmer-oriented high-level languages and structured methods for developing applications will help but will not eliminate the problem of applications backlog and high end-user demand.

DSS technologies today incorporate data retrieval functions, data base management, analytical tools, forecast modeling, reporting and graphics functions, according to Wark. "The thrust in the marketplace is integrated technologies," he said.

Vendors that once supplied strictly modeling tools are being forced to provide data management capabilities in their products, while data management products are having modeling added as a capability, Wark explained.

Communication functions, or the ability of the program to convey results to the user, are crucial for DSS programs, he said. "The communication aspect of DSS is often overlooked. If you can't effectively communicate the [program] results, you are going to find it very difficult to get [managers] to support the decision."

More important, Wark said, are the "people issues" involved with DSS implementation.

Implementing DSS means a new relationship between data processing and the end user, who can now do modeling without the help of MIS. It also means potential conflicts among end users who are accustomed to informal information sharing.

Approaching the user with a service-oriented attitude is the best method for calming some hostilities, according to Wark. Relationships between working groups must also be formalized, he explained. Workers must get out of the user areas to discuss their working relationships, he said.

DP facilities listing out

NEW YORK — Computer Management Research, Inc. has announced the release of its "Mid-Atlantic States Directory of Computer Installations," which lists information about data processing departments in Pennsylvania, Virginia, Maryland, the District of Columbia, West Virginia and Delaware.

The 320-page directory includes company, division, address, type of industry, main telephone number, key data processing personnel, type of hardware, type of applications running, future purchasing plans and number of data processing employees at more than 16,000 installations. The manual contains 133 cross-references.

The book costs $295. Another directory, announced in January, lists New York, New Jersey and Connecticut installations and costs $370.

Computer Management Research is located at 20 Waterside Plaza, New York, N.Y. 10010.

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212)[illegible]

NEWS

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

SYDNEY — IBM raised more questions about its strategy for dealing with AT&T's Unix than it answered at the recent Unixworld Expo '85 conference held here recently. Lief-Erik Kristiansen, a project leader for IBM's IX/370 version of Unix, confirmed IBM's support of AT&T's System V, Release 1 of Unix.

Kristiansen also noted that IX/370 was not a replacement for any existing IBM operating systems but rather an option that enables the vendor to offer IBM products to the growing Unix user community. Conference attendees were left confused by IBM's seemingly independent foray into the Unix arena.

CHINA

BEIJING — Tianjin Computer Corp. announced that it will begin mass-producing 16-bit microcomputers here under the terms of a recently signed agreement between General Robotics Corp. and the Coordinating Committee for International Security Export Control in Paris.

JAPAN

TOKYO — Toshiba Ltd. has acquired 20% of Ing. C. Olivetti & Co.'s subsidiary here. The terms of the agreement cover different areas of cooperation, including the availability of Toshiba products for sale by Olivetti Co. of Japan's worldwide organization.

Under the agreement, Toshiba will help Olivetti sell its product line in Japan.

Meanwhile, Ing. C. Olivetti has purchased 49% of Start Computer Center GmbH of Munich, West Germany. Olivetti's interest in the computer retailer is said to be part of its strategy to become active in the retail form of distribution. The Italian company has already invested in other computer store franchises in the U.S., the UK and Italy.

■

TOKYO — NEC Corp. has introduced an Intel Corp. 80286-based machine here, signaling the beginning of what is expected to be a wave of IBM Personal Computer AT clones here. The PC 98XA machine is part of the vendor's PC 9800 series and works with both CP/M 3.1 and MS-DOS 3.1, NEC claimed. NEC's PC 98XA has a screen resolution of 1,120 by 750 pixels and a standard main memory of 256K bytes, expandable to 768K bytes. The system uses 5¼-in. floppy disks with 1M-byte capacity. The NEC machine is reportedly IBM Personal Computer XT compatible.

■

TOKYO — Fujitsu Ltd. has announced an expert software system called Eshell, which runs on its Facom M series of mainframes, S-3000 series of superminicomputers and Alpha and Lisp processors. Eshell is said to be a simplified program language for users unfamiliar with artificial intelligence or inference systems.

■

TOKYO — Japan's Ministry of International Trade and Industry (Miti) will reportedly form an industry information center to develop protocol standards for microcomputer communications. Miti is presently recommending the business protocol standard, which is based on layers of the International Standards Organization's Open Systems Interconnect model. At the same time, however, Japan's Ministry of Post and Telecommunications here has embraced a different protocol.

WEST GERMANY

HAMBURG — A shortage of qualified personnel is the most pressing problem for DP managers here.

According to Heinz Streicher of the consulting firm SCS GmbH, which conducted a poll on the subject, this situation will not improve in the foreseeable future. Finding experienced analysts and DP managers presents the biggest problem, Streicher said, and most companies (58%) wind up promoting people to these slots from within the organization. The policy in 80% of West German DP departments is to encourage continued education and training for their employees.

UNIX SYSTEM V. SOFTWARE THAT STACKS UP.

High-quality application software written for UNIX System V is available now. And new business programs are continually being developed.

That means increased market opportunities for VARs and ISVs. And end users can be certain their investment in a UNIX System V-based computing system is a smart, sound one.

Quantity and quality

The market for products that are based on UNIX System V has grown significantly over the last two years. There are now hundreds of packages written for UNIX System V. And this growth will continue.

Quality applications—general business packages and development tools—are now available for the AT&T UNIX PC. And AT&T is putting together even more hardworking, industry-specific software to run on AT&T 3B2 and 3B5 Computers.

With so many packages available, VARs can offer more turn key systems based on UNIX System V to an ever-growing customer base. ISVs can sell software to even more customers. And end users can invest in a UNIX System confident there is plenty of quality software available.

Software you can bank on.

UNIX System V has gained acceptance as a powerful, versatile computing standard. More hardware vendors like NCR, Altos, Motorola, Perkin-Elmer and Sperry are joining AT&T in offering products based on UNIX System V.

And we've introduced the System V Interface Definition. Software written under the Interface Definition can run on current and future releases of AT&T's UNIX System V, as well as various System V derivatives offered by AT&T licensees. So there will be an even larger, more comprehensive base of portable software from which to choose.

Our comprehensive UNIX System V Software Catalog lists a [illegible] of packages that run on UNIX System V. For each [illegible] programs [illegible]. And for [illegible] it's a smart way to [illegible] even greater exposure to the growing UNIX System V market.

To learn more about UNIX System V market opportunities, order the UNIX System V Software Catalog—at $19.95 plus tax. Call 1-800-[illegible] and ask for Operator [illegible].

UNIX System V. From AT&T. Consider it standard.

AT&T
The right choice.

Do you know who's accessing your CICS system?

ALERT/CICS™ customers can rest easy. They *know* that ALERT/CICS is not only easy to use, but is also a comprehensive CICS security system.

With ALERT/CICS each authorized user is only permitted to access the transactions, programs, files, and fields within maps that were defined for that user. Terminal security is also available for each of these access levels.

ALERT/CICS customers also love its modular design. They can turn on as much or as little security as they want. This makes it easy for them to "phase in" ALERT/CICS's security.

But what really makes ALERT/CICS great is that it's completely menu-driven. ALERT/CICS customers do not have to learn a rules language. They simply fill in the blanks of the security screens.

So if you're uncertain about the security of your CICS system, call us today at [illegible] to find out more about ALERT/CICS. And start resting easy!

Different breed moves into MIS

It sounds good: Chief Information Officer. CIO. It's the last step, the top of the heap, everything you've worked and sweated for all these years.

But it's probably not for you.

If you're a traditional DP manager from a traditional DP track, the job of CIO will probably go to someone else — someone with a broad business background — and that's hard to take. Here's a job that in many cases hasn't even been defined yet, except to say that it deals with the strategic, corporate use of DP, and people like the high-level task force that designed the job at FMC Corp. in Chicago [CW, May 13] are saying it shouldn't go to a DP manager.

Why not?

Most of the reasons have to do with the role the CIO plays in the corporation. The CIO is often a job created by demand at the top, by a recognition of the need for information about the company's business to be handled as a profit item in a strategic manner and on a companywide basis.

The CIO is a different breed, looking at the MIS department's information product as just that, a product, and at the company's information resources as just that, resources. His role revolves around strategic planning and standards setting for companywide information systems.

William Synnott, CIO at The First National Bank of Boston, described in a recent interview [CW, May 13] three major roles a CIO must be able to play:

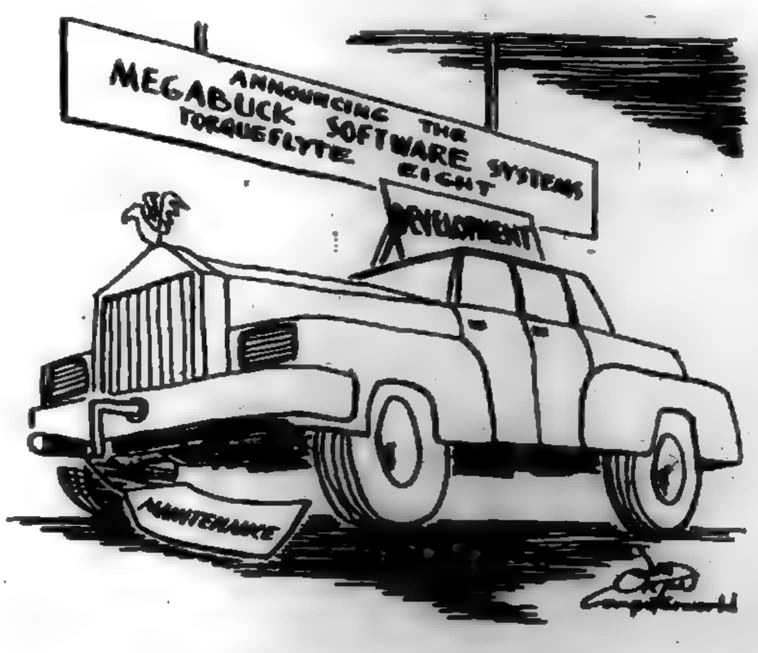
- **Businessman.** The CIO must have a thorough, detailed understanding of the company's business.
- **Manager.** The CIO must possess generalist management skills and must be able to manage any number of activities.
- **Technician.** The CIO must be able to use technology as a trade tool.

What are DP managers to do in this situation? First and foremost, they must concentrate on business. Not the information business — that should be a given — but the company's business. All the business information that flows through their department is a possible resource — a possible profit item if managed correctly.

But learning about business is not an easy task. Advanced business degrees are not the answer to every question. Synnott advised, "The only way to learn your own business is to be in the business." This may require what Synnott referred to as a change in alliance: a move away from involvement with finance and accounting to involvement with strategic planning, marketing and product management efforts within the company.

The CIO must also look for the opportunity. Technology can drive change in more ways than one. The job of CIO often is created when a company's information resources are fairly well distributed throughout the company's infrastructure — when there are goodly numbers of minis and micros in use, crying for a strategic plan to optimize their use. In such a case, the question "How?" has already been answered; the tools have been passed out. But the strategic question of "What to do?" remains unanswered in many cases, waiting for a CIO to set the course.

For today's DP manager, the job of CIO is a step up, a change for the better. But it demands corresponding changes from that manager — changes in orientation, in management style, in perspective.



LETTERS

Musician robot not the source of art

I was fascinated by the column "Robot pipes technology into the beaux arts" [CW, April 29] and by the account of the robot Wasubot and its organ performance. I believe that performance to be an incredible technological achievement.

However, I disagree that the Wasubot robot was used to create art. The art had already been created when the score was put to the paper. If Wasubot had done more than storing "the pattern of play in an output buffer" and then executing that pattern, I would be more inclined to agree that it created art.

If the robot had done something such as search a repertoire for other scores (patterns of play) and use them to make a new arrangement, then I would grant that art was created. Would it be correct to say that a person creates art when reading Hemingway?

Upon reflection, what Wasubot did was no different from the mechanical task of screwing lug nuts on a car with a programmed set of instructions, only its task was much more complex. The aspect that inspires awe is that Wasubot — a nonhuman pile of wires, motors and metal cases — produced a thing of beauty heretofore only associated with humans. We are used to having robots produce things like stampings or spot welds, but something as aesthetic as music is amazing.

With the advances in expert systems, consider the possibilities. Perhaps we could be looking at another Mozart.

VIEWPOINT

Micro saturation heightens need for control

THE DATA CENTER
John P. Murray

With the relative low cost and simplicity of microcomputers, people outside the information processing department are virtually stampeding to use them. Clients are able to do a great deal of their work independently when they want it and are often enamored with the concept of being freed from what they consider the unnecessary constraints and restrictions placed upon them by information processing. "Do your own thing without the annoyance of information processing red tape" is the current cry in many client departments.

The preceding paragraph is by no means "news." We are all aware of the burgeoning aspects of the micro culture. The benefits inherent in this growth, to clients as well as to information processing, are considerable. However, another aspect of this situation should make those of us with experience pause, and that aspect is control.

A faction that knows more than they understand about what they propose appears to be developing in some organizations. This is not a new phenomenon; clients have been quite able in the past to point out flaws in design and development work, often unhindered by any reasonable degree of knowledge.

I recall a presentation made by an MIS manager to a group of senior executives on the status of various development projects. As the manager began to discuss a proposed accounts receivable package installation whose completion was estimated at eight man months, a newly hired executive interrupted the presentation. "I don't know anything about data processing," he said, "but I'm certain I could get an outside consultant and install that system in one man month or less." Such assertions are irritating but, at least in the above context, harmless. Although these clients may believe they can do a better job, they are usually not in a position to act. Such situations are common; it is easy to criticize knowing that you won't be asked to show results.

However, a somewhat different case arises when micros are the arena. Many clients are currently euphoric with being released from the shackles of MIS. Early and rather simplistic success encourages these people to strike out for more dramatic results. The plea becomes, "Let's put it in the personal computer." Doing so may be a great idea, but the problem involves making sure installation is done correctly and that adequate control, including documentation, is also installed and maintained.

Poorly written micro programs lethal

Ill-conceived and carelessly written programs without adequate controls are potentially just as lethal on a micro as they are on a mainframe. In fact, the programs may be more serious, if only because they are brought into production more quickly and may find their way into the mainstream of the organization sooner than more conventional systems.

Many have learned that strong, effective controls must be established and enforced throughout the information processing function. This is necessary to build a strong environment and maintain a consistently high level of accuracy and service. Of course, in some installations this concern with control has never been implemented, and the lack of that concern is evident. These installations have high levels of reruns, most of the work is carried on in a panic mode, and the accuracy of much of the input data, and therefore the information produced, is suspect. The cause — or at least a significant contribution to the cause — of such results can be traced to a lack of fundamental control.

It makes no difference how fast work can be produced or how easily answers may be obtained. The serious problem is that often times, because the work was produced on a micro, it is automatically considered valid. The feeling is that because "old Charley" did the work himself (and who knows more about that area than old Charley) it must be correct. The possibility that old Charley may have made invalid assumptions, used bad data or made errors in the program are ignored.

Micro control a difficult task

Any attempt to provide and enforce some type of control and structure on micro users presents a difficult and, perhaps in many organizations, impossible task. But some effort should be devoted at least to raise the issue and attempt to get senior management to consider the organization's needs in this area. The politics of this issue can be significant, yet someone needs to point out the value of adequate controls and the need for a reasonable level of constraint.

The consequences of everyone being able to "go their own way," use the data they want and disregard or change data that they think should be altered or not included because of some personal bias or because they desire to achieve a given result will become apparent someday. It is hoped the realization doesn't occur because of some incident that creates serious and far-reaching consequences for the entire organization.

The information processing department should work with micro users to help them expand their capabilities and to assure senior management that there is at least an awareness of the necessity for reasonable controls and that people are adequately concerned about the issue.

Murray is director of management information services for Rayovac Corp., Madison, Wis., and author of Management Information Systems as a Corporate Resource, *published by Dow Jones-Irwin.*

Basic design-phase flaws hinder system development

READER'S PLATFORM
Bo Sanden

When mainframe software systems are constructed, an overall design phase usually precedes detailed design and programming. In the microprocessor world, we still seem to believe that our systems are so small and simple that overall design is not necessary.

However, with today's microcomputers and their communications capabilities, a micro-based system can be as complicated as a mainframe system. Still, management often refuses to see the need for qualified system design. Consequently, few people develop the necessary skills.

I manage a group that has taken over a distributed real-time banking system based on micros. We are responsible for the continuing installation of new nodes in the network for maintenance and further development. New functions are added when banking regulations change and as user needs warrant.

The old system was an on-line, data-entry application with a table showing what fields were to be entered as part of each transaction. There were a limited number of transactions types, each with an entry in the table. For each field, a validation routine was specified. It would, for example, validate the check digit of an account number or see if a date field contained the proper banking day.

The new application uses the data base interactively. If, for example, a check is received, the balance of the account is consulted before the transaction can continue. The transaction is executed in a branch office computer, but the balance record resides at a regional center, so the validation routine exchanges messages with the regional center computer. The data is used for further validations and finally updated and sent back to the regional center.

Thus the validation routines are no longer independent but tied together by an intricate set of variables, and when a certain condition is detected in one validation, a flag is set and then tested in other validation routines. One validation routine may be used for similar fields in different transactions. The actions vary slightly, so the routines contain direct tests on the transaction code.

From the old application we have inherited a main loop that interprets the field table and handles one field at a time for the current transaction type. In our application, this procedure depends rather heavily on the transaction type and can involve voucher printing, passbook printing and updating of certain accumulators. This is controlled by means of a set of special-action flags defined for each transaction type and also via direct tests of transaction code.

To further complicate the new application, two types of terminals have been introduced: teller terminals, which handle only a set of pure financial transactions, and administrative terminals used exclusively for another set, including opening of new accounts. The financial transactions have positive transaction codes and the administrative ones have negative codes.

The system is working well but is barely maintainable. We can still introduce a new transaction type or modify an old one, but other changes are extremely complicated. One teller transaction receives cash and documents and credits the total to a checking account. At one point we were asked to make a similar transaction available at the administrative terminal. It took months to find all the tests that had to be changed in a dozen different validation routines and in the main loop.

The direct cost in man months is not the greatest problem. Because each major change affects so many modules, we can handle only one or two in parallel. Otherwise the programmers would interfere with each other's changes. Furthermore, while a new release with a major change is being prepared, we have to issue subreleases with minor changes and error corrections, which also have to be included in the major releases. All of this severely restricts the possibility for us to develop the system further.

Our application has outgrown the simple table model on which it was based. Probably the behavior of each transaction should have been modeled as a subprogram, which in turn would call subroutines for the common field types.

Design work is creative and is therefore difficult to plan and manage. People in the fast-moving world of micros do not want to spend the necessary time on the intellectual design effort. Ironically, the lack of basic system design in our case turned out to be the most important money issue in the long run. Maybe the system will have to be prematurely abandoned when vital modifications can no longer be made at reasonable speed and cost. $

Sanden is in charge of a distributed systems project at Philips Data Systems in Monterrey, Mexico.

ONE THING VT200 IMITATORS CAN'T BEGIN TO IMITATE.

In a world full of imitations, it's an easy mistake to assume that any terminal that looks like a VT200™ will perform like a VT200. After all, it's no major trick to imitate the most superficial features of a video display terminal.

But there's one test of a video terminal that simply can't be judged in a 15 minute demonstration.

The toughest test of all. The test of time.

While other display terminals were designed to impress you in a showroom, Digital's VT200 was designed to make a more lasting impression. To keep you comfortably productive years down the road.

That's what inevitably separates an industry standard from the rest.

And why so many professionals return time and time again to products with the Digital logo.

THE DIGITAL LOGO MEANS LONG TERM PRODUCTIVITY.

It's no coincidence that the VT200 family was designed by [illegible] in front of display terminals day in and day out. They've discovered the shortcomings, the idiosyncrasies and all the subtle little problems that can end up robbing you of productivity.

As a result, some of the VT200's best features are ergonomic. The angle of the screen. The sculpture of each key. The design of the keypad.

These are the things that become most apparent after hours of prolonged use. And often spell the difference between a terminal that's a genuine productivity tool and one that's – quite literally – a pain in the neck.

In fact, the VT200's ergonomic design and the resulting ease of use were two of the reasons it won the International Design Award in both 1983 and 1984.

THE DIGITAL LOGO MEANS LONG TERM COMPATIBILITY.

Whether you're looking for a terminal for your VAX,™ DECsystem or PDP-11™-based system, the VT200 has a rather obvious advantage over any other terminal you might consider.

We built the host. As well as the other peripherals you'll be using.

So it only makes sense that our video terminals are substantially more compatible up and down the Digital family line. Each new generation, for example, brings with it all the important elements from previous generations. Which is why you'll find some of our customers using 10 year-old VT52™ terminals with brand new VAX systems. The simple fact is, Digital has always been committed to protecting your investment with every move you make.

In addition, our breadth of product line means Digital can provide you with a total solution. Hardware, software and peripherals. And while single sourcing is not an end in itself, it certainly provides an extraordinary measure of convenience, compatibility and reliability. Particularly when the single source is Digital.

[illegible] SUPPORT.

When asked to single out the strongest feature of Digital's video terminals, many users point to the most visible asset of all. Durability.

Over the years, we've heard some pretty gruesome stories about the ordeal our terminals have endured. Like coffee that was spilled on keyboards. Or cables that were inadvertently ripped from their ports. They've even survived trial by fire. While it's unreasonable to expect even the toughest video display to come through every major trauma unscathed, it's comforting to know your terminal has a reputation for survival.

It's equally comforting to know you've got a support team behind you every step of the way. A support team rated the best in the business by users. They're there for everything. Not just the repairs, but system design, training, updates, education and seminars. All to make sure you get the absolute maximum from your video terminals. Today, tomorrow, and years down the road.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

The VT220,™ VT240,™ and VT241,™ like every Digital hardware and software product, are engineered to conform to an overall computing strategy. This means our products are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy from desktop to data center.

For a detailed brochure or more information, as well as the name of the Authorized Terminals Distributor or Digital Representative near you, call 1-800-DIGITAL, extension 702. Or write Digital Equipment Corporation, 129 Parker Street, Maynard, MA 01754.

‘Not for sale’ tool meets Xerox’s needs

By John Desmond
CW Staff

EL SEGUNDO, Calif. — An internally developed system used to track customer service problems at Software AG has become the software of choice for Xerox Corp.'s printing services division — even though it was not a marketed product.

The Xerox printing division implemented Software AG's On-Line Customer Support System (OLCSS) in April after deciding to purchase Software AG's Adabas data base management system, Natural fourth-generation programming language and Com-Plete teleprocessing monitor. It was during the DBMS selection process that the printing division personnel learned of Software AG's in-house application, which the Reston, Va.-based firm then customized for Xerox's use. The OLCSS currently helps Xerox manage several thousand field engineers and laser printer customers.

Xerox's decision to modernize its manual customer tracking system was based on upper management's commitment to improve customer service, according to Ken David-Adeleye, a Xerox customer support consultant who shepherded the OLCSS project. Xerox maintained the manual system of tracking customer service problems based on data supplied by field service engineers and not directly from customers, David-Adeleye said. But "the corporate commitment was that we would speak to customers directly," he said.

After deciding he needed an integrated system to manage information, David-Adeleye concluded a DBMS was a must. "Being somewhat naive, I took a wide view of things," he said. He looked at more than 100 DBMS products, eventually narrowing them to 32, including systems from Cullinet Software, Inc., Applied Data Research, Inc., Cincom Systems, Inc. and Information Builders, Inc. From his background as a systems programmer with

LU6.2: Behind the hype

SOFTALK
John Gallant
CW Senior Editor

Mercifully, a natural immune reaction protects one from becoming infected by the hype that pervades the software world. Common sense and skepticism rush to dispatch the industry-generated adjectives and hyperbole that threaten to overwhelm users.

If terms like "state of the art," "leading edge," "artificial intelligence based" and "revolutionary" were to vanish overnight from product literature and advertising, a collective sigh of relief would be exhaled by users and observers everywhere.

Most people have adopted a cautious, wait-and-see attitude toward new products and technologies. Software package A

Execucom packages bow

AUSTIN, Texas — Execucom Systems Corp., developer of the Interactive Financial Planning System (IFPS) decision support system (DSS), has introduced a presentation graphics package and a version of IFPS for the Apple Computer, Inc. Macintosh.

According to a spokesman, the Impressionist graphics system, which runs on processors ranging from mainframes to microcomputers, and the Mindsight Macintosh version of IFPS will be unveiled for the first time during Execucom's June users group meeting. The products are scheduled for shipment during June and July.

Impressionist runs on IBM mainframes and Personal Computers, including the Personal Com-

Dialogic Systems adds application development tools

NEW YORK — Dialogic Systems Corp. has announced three products in the Dialogic/One application development system for IBM MVS/TSO/ISPF environments, including a remote-connect version that enhances the productivity of remotely located programmers.

Also announced were the Dialogic Cobol Editor for the editing and maintenance of Cobol programs and the Dialogic VTS/MA program for facilitating multiple concurrent TSO/CICS/IMS sessions for programmers in IBM shops.

Dialogic/One is composed of the Dialogic/10 Midframe Computer and associated software. The Midframe incorporates parallel Motorola, Inc. 68010 and 68000 microprocessors and a 400M-byte disk drive. The hardware is used to off-load the host and speed response time for applications developers. The announcements enhance existing features of the Dialogic/One Cobol applications development system.

According to a spokesman, the Dialogic/One remote-connect version works by off-loading interactive tasks onto a separate machine. The Dialogic Midframe is placed between the mainframe and IBM 3270 terminal cluster controllers. The ability of programmers to access data directly from the Midframe results in consistent subsecond response time.

Two models of the remote-connect version are scheduled for availability in the fourth quarter. Model 4 can handle up to 9,600 transactions per hour with 64 active users, while the Model 6 handles up to 14,400 transactions per hour with 96 active users. Prices range from $198,000 to $300,000.

The Dialogic Cobol Editor is said to reduce the number of mainframe compiles required. The product features many characteristics of a Cobol compiler, including dynamic syntax checking and a dynamic cross-reference facility. It also features a zoom capability and enhanced window manipulation. It is priced at $7,000 and is available now.

The Dialogic Virtual Terminal Session/Multiple Access (VTS/MA) is a window to the IBM MVS operating system that supports concurrent Dialogic activities. In addition to its editing capabilities, the programmer can execute TSO, IMS or CICS programs, commands or computer-intensive compilations on the host.

The Dialogic VTS/MA is said to extend the programmers' Dialogic session, releasing the terminal for other tasks while concurrently processing submitted work on the host. The VTS/MA program is a field-upgradable option, scheduled to be available in the third quarter for $10,800.

Dialogic Systems is located at 1335 Bordeaux Drive, Sunnyvale, Calif. 94089.

Sterling Software produces the best DASD Management System in the world

... and we can prove it.

DMS/OS™ the DASD Management System from Sterling Software Marketing, has consistently been rated highest for overall user satisfaction in leading independent surveys. DMS/OS users — worldwide — trust our product to manage approximately 489,935 volumes of data a day.

15,309,000,000,000 bytes of data daily...
That's a lot of user confidence, and here is why.

DMS/OS — The First $25 Million Seller
In DASD Management
In 1984, DMS/OS became the first system software package for data management to top a total $25 million in sales.

1,000 users give their reasons for choosing DMS/OS

- Easy to install — Easy to use
- Keep more data on-line, using less space
- On-line reporting for fast decisions
- Dramatically reduces backup and recovery time
- Supports all standard data set organizations
- Fast data accessibility, regardless of medium
- Adaptability to new hardware/software systems
- Automates migration to 3380's
- Reduces personnel costs

We Listen To Our Users
When DMS/OS users tell us about their data management needs, we listen — and respond with enhancements that fit those requirements. When you call for technical assistance, implementation advice — or any question at all — you are talking to a key member of the DMS/OS development team.

No matter what hardware or software changes occur in your operating environment, DMS/OS keeps pace... continuing to evolve... always state of the art.

Let Us Prove It To You...
With A FREE 30-Day Evaluation
Sterling Software Marketing offers a free DMS/OS evaluation. We'll show you why we are the proven leader... You have nothing to lose, and everything to gain in DASD space.

For your FREE DMS/OS evaluation call today 800-824-8512. In California, Alaska, Hawaii, and Canada call collect 916-635-5535.

IBM-compatible communications software debuts

CUPERTINO, Calif. — Motorola/Four-Phase Systems, Inc. has introduced micro-to-mainframe communications software that allows IBM Personal Computers and terminals with asynchronous communications capabilities to communicate with IBM mainframes through Motorola/Four-Phase's Series 4000 and 5000 minicomputers.

With MFE-Central, a Motorola/Four-Phase mini can function as a personal computer controller node. MFE-Central supports up to 16 micros or a combination of micros and asynchronous terminals that can be located remotely or locally.

MFE-Central allows personal computers to access the Series 4000 or 5000 via asynchronous protocols and exit the system through Motorola/Four-Phase protocols. By using MFE-Central as a micro-to-mainframe link, information can be downloaded from the mainframe and used on the micro.

MFE-Central costs $2,000. Network site licensing costs $40,000.

Motorola/Four-Phase Systems is located at 10700 N. DeAnza Blvd., Cupertino, Calif. 95014.

Instar creates escrow group

MALDEN, Mass. — Instar, Inc. has announced the formation of the Software Escrow Security Division to act as an escrow agent in administering software licensing agreements between developers and users.

Software Escrow Security will control access to source material as well as monitor update releases. Source codes will be stored in climate-controlled vaults at a data security facility in the East. All users pay an initial $200 for the service, which costs $300 per product source code stored per year on average.

Instar's Software Escrow Security Division can be reached at P.O. Box 0, 49 Clinton St., Malden, Mass. 02148.

Plexus offers supermicros Unix System 5 enhancement

SAN JOSE, Calif. — Plexus Computers, Inc. has announced an enhanced version of AT&T's Unix System 5, Release 2, for its line of supermicrocomputers.

Sys5.2 succeeds the company's Sys5 and offers a scatter-memory technique that permits programs to be written to memory in noncontiguous blocks, a spokesman said. The technique reportedly reduces disk swaps while permitting more and larger processes to reside in-memory at one time.

Sys5.2 also offers a virtual protocol machine feature that is said to permit the downloading and uploading of files to IBM and compatible mainframes.

Sys5.2 has been extended to include the Plexus Network Operating System, which is said to provide Ethernet-based networking among Plexus machines.

Users reportedly can transport object code from Sys5 to Sys5.2 without modification.

Sys5.2 costs $[illegible] for a 16-user system and $[illegible] for a 32-user system.

More information on Sys 5.2 is available from Plexus Computers, located at 3833 N. First St., San Jose, Calif. 95134.

EXECUCOM

from page 29

puter AT and XT, and minicomputers from Digital Equipment Corp. and Prime Computer, Inc.

The product is said to generate a variety of graphics formats, including charts, diagrams and text images. It features a graphics editor and can be used with digitizers to create and modify images, the vendor said.

Impressionist, a high-resolution system, can be used to create slides, hard-copy plots and transparencies using a variety of output devices. It interfaces directly to Execucom's IFPS/Personal, the IBM Personal Computer version of IFPS. The micro version is priced at $995, the mini version at $30,000 and the mainframe version at $40,000.

The Mindsight Macintosh version of IFPS is said to provide modeling, data management, goal-seeking and "what-if" capabilities and graphics and reporting tools. It uses Macintosh features such as icons, windows, pull-down menus, dialogue boxes and the mouse interface, the vendor said.

Mindsight reportedly can perform automatic solution of simultaneous equations, logical consolidation of models and data by variable name and financial, statistical and mathematical functions and subroutines. It is said to provide a full screen editor for creating and modifying models and data and an editor for entering, editing and calculating data.

Mindsight requires a Macintosh with 512K bytes of random-access memory and a second disk drive. It costs $595.

Execucom Systems is located at 3410 Far West Blvd., Austin, Texas 78731.

Availability of IBM IPDT announced

WHITE PLAINS, N.Y. — IBM has announced the availability of its Integrated Processing of Data and Text (IPDT) package. The package runs in IBM MVS and DOS/VSE environments.

IPDT allows IBM CICS users to access services provided by IBM's Distributed Office Support System and Personal Services/370 software, according to IBM. IPDT also reportedly can be used to create standard letters and forms and to compose documents from stored and keyed text.

IPDT for MVS (CICS/VS) is scheduled to begin shipping immediately. Shipments of IPDT for MVS (IMS/VS) are scheduled to begin in September IBM said.

The one-time charge for IPDT for MVS is $4,550 and for DOS/VSE is $4,564.

IBM is located at 1133 Westchester Ave., White Plains, N.Y. 10604.

VMSecure gets system upgrade

VIENNA, Va. — VM Software, Inc. has annouced Release 2.0 of its VMSecure security system for IBM mainframes running under the VM operating system.

VMSecure 2.0 includes enhancements to its resource access control, user directory and disk space management capabilities. Users reportedly can now establish rules to indicate how their virtual machines and mini disks can be accessed by other users, while group managers can establish rules for individual identifications.

Other enhancements include a display of the date, time and terminal address of the last terminal session begun; a command-level report that lists attempts to log on, link, autolog spool and tag; and a report of activity in the virtual machine.

VMSecure 2.0 costs $14,000.

VM Software is located at Suite 355, 2070 Chain Bridge Road, Vienna, Va. 22180.

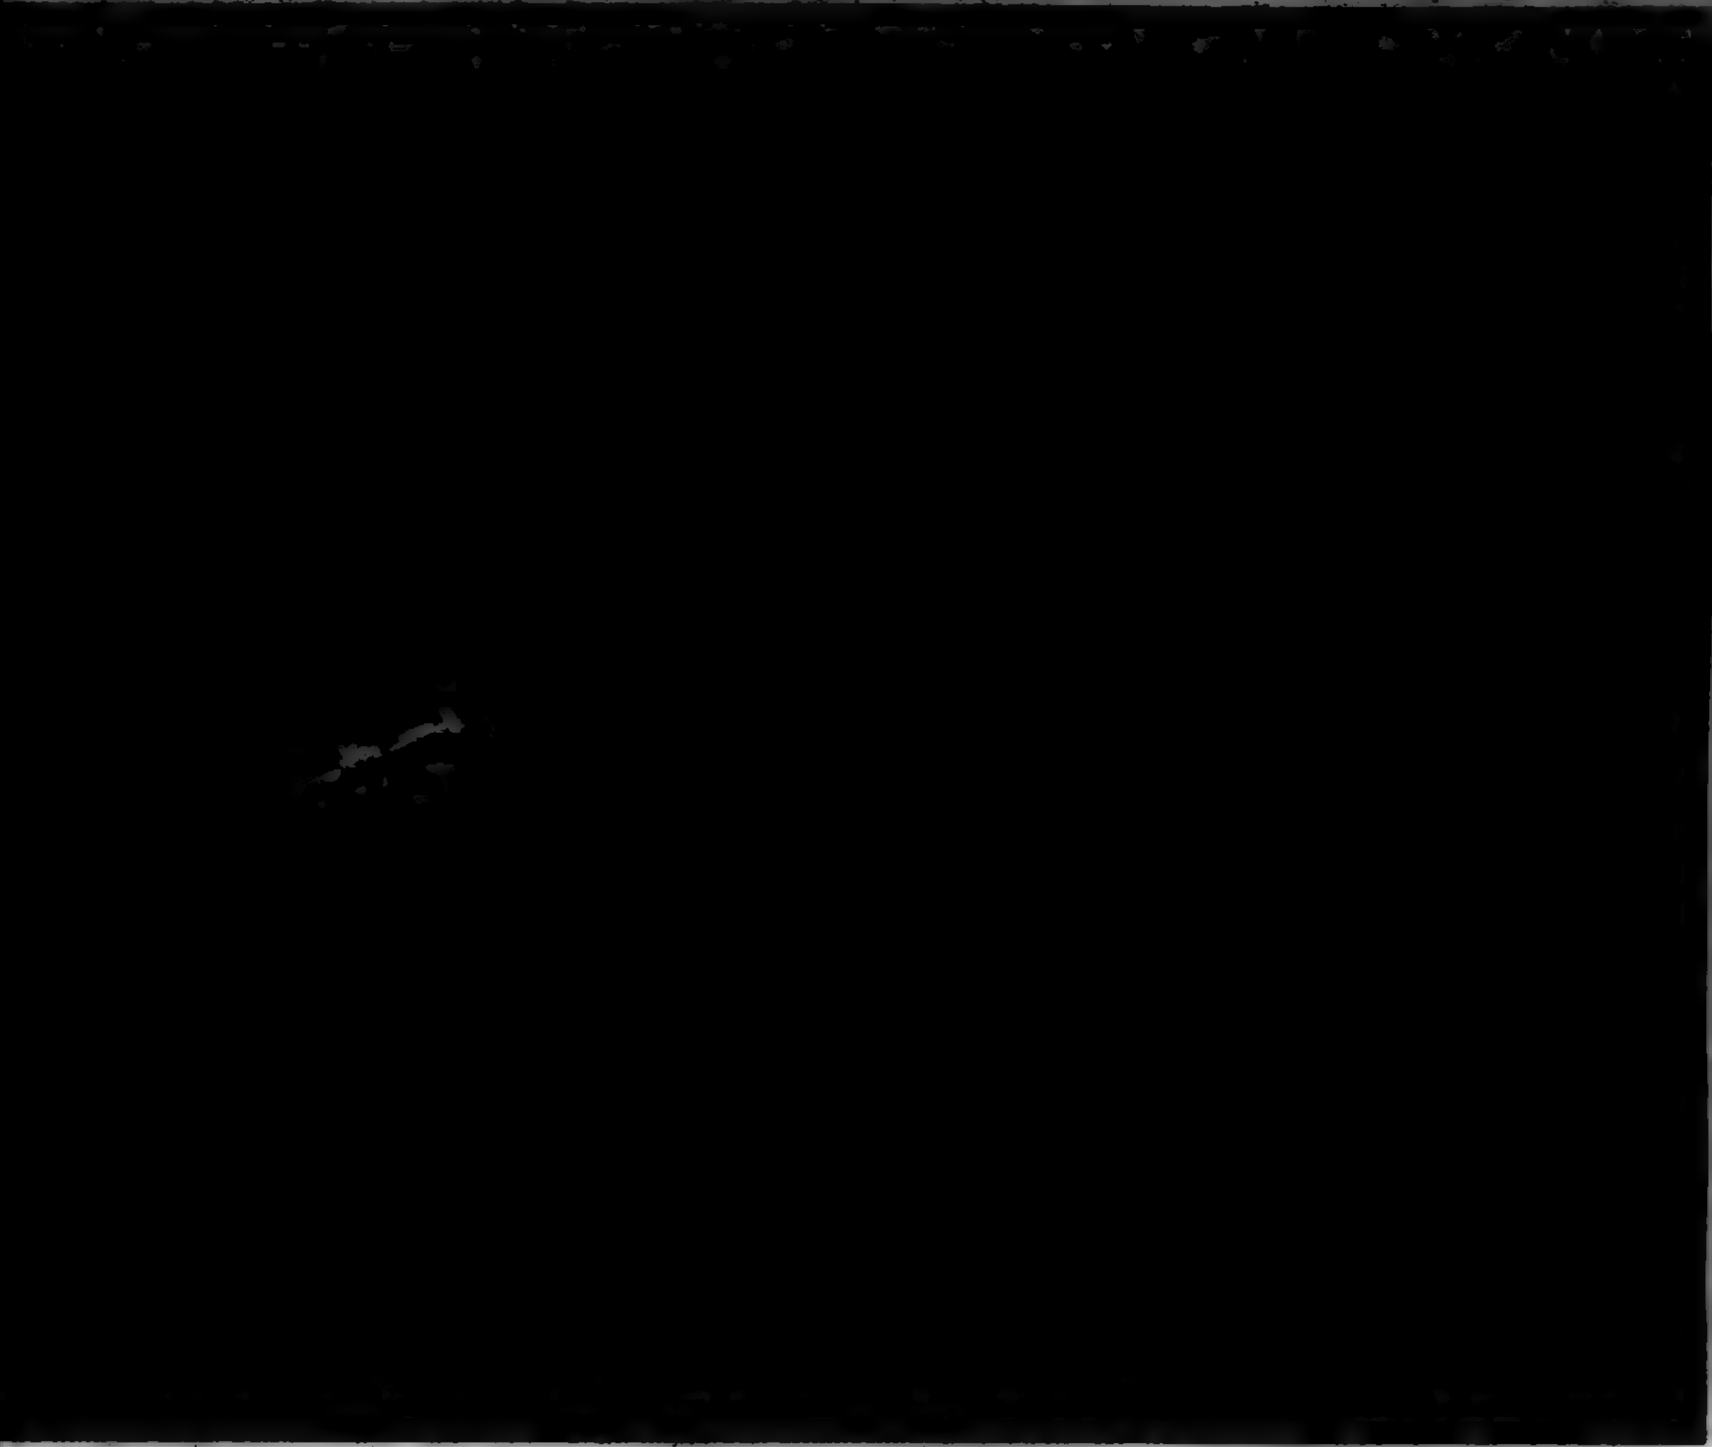
The 6000 Series is the one-system solution that connects end-users, MIS and the mainframe data base.

We call our solution "connectivity." Through our sophisticated IBM communications software, the multi-user, multi-tasking 6000 Series computer system acts as a node. It connects your end-users, your MIS department and the mainframe data base.

Leading edge systems from leading edge silicon. The 6000 Series gives you several big advantages. First, we make the MC68000 microprocessor family—the best UNIX* engine around. Then we vertically integrate the 68000 family into the system. But we don't box you in. The architecture is open, so you can add capability as you need it. And, since the 6000

you make contact.



Series is UNIX-based, you have access to hundreds of software applications.

Software that end-users want and developers need. The 6000 Series comes standard with all the software necessary to get started—spreadsheet, word processor, DBMS, data entry and communications. There's even software for information interchange.

And, to create your own software solutions, we can provide the development tools you need.

Finally, we provide the kind of full service and support that only a Fortune 100 company can offer. Our Customer Support Operation is staffed with more than 1,400 specialists in 175 cities across the country. We're ready 24-hours a day, seven days a week.

We're the contact you need. Prove it to yourself. For a limited time, we'll loan you a 6000 so you can make the contacts *you* need. Call us at 1-800-528-6050, ext. 1599, to see if you qualify. Or write us at Four Phase Systems, 10700 North De Anza Blvd., M/S 51-3E7, Dept. T, Cupertino, CA 95014.

From silicon to systems, we're the one solution.

SNA

from page 29

may actually represent a significant technological improvement over existing products. But users, analysts and consultants are likely simply to nod politely and suspend judgment until first-hand observation and experience supply them with the information needed to form an intelligent opinion.

No one wants to err on the side of overzealousness today. Even if the technology is highly advanced, the reaction of the populace may still be ho hum in nature. One tends to become jaded by the rapid pace of technology.

So when one encounters a consensus that a certain technology is truly revolutionary, one ought to sit up and take notice. Such is the case with IBM's 1982 Systems Network Architecture (SNA) enhancement called Logical Unit Type 6.2 (LU6.2) or Advanced Program-to-Program Communication [CW, May 27].

Never mind that you don't understand the workings of SNA. Like the fabled esoteric formula for Coca-Cola, probably only a handful of people really know what all the layers, Logical and Physical Units and protocols of SNA mean. If you were one of those people, you would likely be in a different profession — and probably a more lucrative one at that.

IBM

The gist of what anyone needs to know to understand the significance of LU6.2 can be summed up in just a couple of sentences. According to Robert Sundstrom, manager of communications systems architecture within IBM's SNA Group in Raleigh, Va., two software systems that support the LU6.2 protocol would be able to communicate as equals — that is, send and receive data on a peer-to-peer basis — within a network regardless of the type of host systems supporting them. When fully implemented, the hardware would become transparent to the communicating applications.

Ignoring the sophisticated technology at work and the expertise involved in bringing that technology to the fore, it is as simple as that. Now consider for a moment what that means. Processors of all shapes and sizes could conceivably be linked via software. Need some mainframe general ledger data to slip into your micro spreadsheet? No problem. Just issue the proper data base call and there it is.

The micro program would, ostensibly, be on an equal footing with the mainframe or minicomputer application and would be able to send or receive information as required. In the current SNA setup, one machine is forced to play a secondary role to another, the primary processor, which controls all network communications from above.

Not surprisingly, your immune system has gone into high gear and is rapidly bringing to bear all the skepticism and disbelief it can muster. Simple software-to-software communications? Sure, you have heard similar claims in the past.

LU6.2 considered technical advance

But without exception, users, analysts, vendors and even IBM itself said LU6.2 represents one of the most important technological advances to come about in years. When asked whether LU6.2 would revolutionize intermachine communications, Sundstrom — who, you must remember, works for a company with a reputation for being tight-lipped second only to that of certain monastic groups — replied, "Yes, definitely."

That is quite an endorsement coming from an organization that crafts its statements of direction carefully enough to make the directives of the College of Cardinals look slapdash.

What does LU6.2 mean for you today? Probably not a great deal. The protocol is only supported by a minority of IBM's products. IBM's Personal Computer offerings supporting LU6.2 are particularly weak. You will not be using Lotus Development Corp.'s 1-2-3 to tap casually into IBM's IMS tomorrow.

But the wheels are in motion. IBM, by its own admission, is carefully assessing which of its systems will be first to support the protocol, and other vendors are moving to embrace the real opportunity LU6.2 represents. This is not to say you should pack your immune system into a drawer. But don't be too quick to pass this technology off as just some more hype.

#3 In A Series: Setting Standards in Mainframe Applications Software.

Could This Be The End Of Hand-Me-Down Software?

Think of how applications software has always been built. And enhanced.

A quick fix on a piece of general ledger software . . . another loop on the accounts payable package . . . a hasty patch to the payroll program and presto: Announce to the world a "revolutionary new generation of software designed to address today's information needs."

Not only is it not true. It doesn't work anymore. And you deserve something better. Something more than a hand-me-down, patched-up solution.

Which is what Software International, the company whose first general ledger package started the applications software business, is suggesting right now.

The time has come to put aside expedient answers. To dismiss short-lived whistles and bells. And to begin building and delivering software that makes real sense both from the data processing and end-user points of view. Software, built cleanly, intelligently, that gives you increasing value over the long term.

We detail our thoughts in a 35-page white paper entitled "Setting Standards in Mainframe Applications Software." We'll send you a copy at no cost.

The paper focuses on fifteen topic areas we believe to be critical to the long-term success of applications software installations. It looks at the coming generation of "intelligent" software architecture and what that will mean for you.

Our paper covers software installation, service and support. In short, what you should expect — even demand — from your software vendor.

Whether you are developing your own software or evaluating a package, you'll want to read this timely report.

It'll shed fresh light on some old ideas.

For a copy call 1-800-343-4133, in Massachusetts 1-800-322-0491, or clip the coupon below.

Software Thinking That's Impossible To Ignore.

XEROX

from page 29

experience in DBMS, David-Adeleye had a good grasp of technical details.

As David-Adeleye was narrowing down the DBMS choices, Xerox management decided the OLCSS should run on an IBM 4341 under MVS. Management also set an April 2, 1984, deadline for having the system up and running and serving customers. That gave David-Adeleye and two other members named to his team five months to decide on a system and get it in place.

"It was a major evaluation," he said. "One requirement was that the vendor provide extensive support. We're a planning organization, not a technical shop." David-Adeleye talked to customers of the vendors he had narrowed down and to senior executives in the vendor firms.

Vendor chosen

Based on what was said about Software AG, the technical aspects of its products and the company's commitment to provide the support Xerox needed to meet its deadline, Xerox chose Software AG as its vendor.

During the evaluation phase, David-Adeleye's description of the customer tracking system Xerox needed sounded more and more like Software AG's own system, dubbed Tsop, said Monte Hipple, Software AG senior account manager. David-Adeleye said Software AG's management was "a bit taken aback" by Xerox's interest in the internal program, but they agreed to customize it to meet Xerox's needs.

A major change to Tsop requested by Xerox was the addition of a mandatory key word structure. With the added function, a support specialist answering a hot line call from a customer is able to retrieve a standard solution to a problem. "It would have taken us at least a year to develop that functionality on our own," said Sharon Remer, a Xerox customer support consultant who joined the project team.

Time constraints

The Xerox OLCSS was brought up rapidly to meet the deadline. "The main problem was the time constraint," Remer said. Xerox's central DP division was hesitant at first to install the Com-Plete TP monitor, since they had just converted from Honeywell, Inc. hardware to IBM and were still on a learning curve, Remer said. "But we brought up Com-Plete with minimal support, and now the data center wants to use it for other things," Remer said.

Apollo introduces graphics interface building system

Domain/Dialogue designs, manages

CHELMSFORD, Mass. — Apollo Computer, Inc. has announced the Domain/Dialogue system for building custom menu-driven graphics interfaces.

Domain/Dialog runs under all Apollo operating systems, including Domain/IX, the company's implementation of AT&T's Unix.

According to a vendor spokesman, Domain/Dialogue includes the User Interface Design Kit for designing, testing and modifying user interfaces, and the User Interface Management System for displaying and managing the user interface.

The User Interface Design Kit provides a comprehensive set of building blocks, including switches, menus, icons, pop-ups, text input fields and scroll bars, which developers can use to customize interfaces.

Using the product's User Interface Description Language, designers specify the desired components and layout of an interface.

The kit also includes a Description Language Translator utility that builds the desired interface from specifications. The system is said to free applications developers from having to write code to create interfaces.

Interface management

The User Interface Management System displays, manages and maintains all aspects of the interface while a user application is running. The architecture of Domain/Dialogue allows for modification of user interfaces by separating interface software from the application. The feature lets users test and modify interface prototypes without affecting applications code.

The Domain/Dialogue User Interface Design Kit and User Interface Management System will be available on all Domain workstations within 60 days. The User Interface Management System will be included in the next release of all Apollo operating systems. The User Interface Design Kit, required by software developers, will be sold separately.

The Domain/Dialogue User Interface Design Kit costs $1,200 per node and $10,000 per site.

Apollo is located at 330 Billerica Road, Chelmsford, Mass. 01824.

Finally… A Unified Overview of PC Software Today and What it Means for You

The Software Revolution: Trends, Players, Market Dynamics in Personal Computer Software

By: Robert T. Fertig
Enterprise Information Systems, Inc.

The Software Revolution: Trends, Players, Market Dynamics in Personal Computer Software is a manager's guide to systems and productivity-tool software, including operating systems, database management systems, telecommunication processors, word processors, spreadsheet calculators, business graphics and draw tools, and – most importantly – integrated software. The decisionmakers who manage today's office systems know that the key to increasing productivity in the 1980s and beyond will be software integration, both within microcomputers and between micros and their more powerful host systems. *The Software Revolution* provides the background and guidelines essential for intelligent, informed software selection and integration in the industrial and office setting.

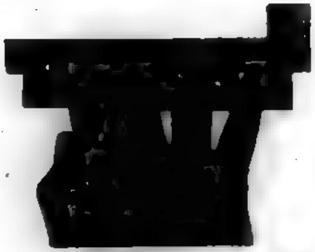
TeleVideo corrects the VT220 key mistakes.

The new TeleVideo® 922 shares but one feature with the VT220*: DEC®-compatibility. The similarity ends there.



TeleVideo 922

DEC VT220

1. Take our keyboard, for example. The RETURN key is within direct, easy reach. But VT220 users must stretch over an additional key to hit RETURN. Or have the hands of a concert pianist.

Here's ours.

Where's the VT220 ESCAPE key?

2. Our ESCAPE key is located above the TAB key, right where you'd expect to find it.

Theirs isn't.

In fact, you have to go hunt for the VT220 ESCAPE key halfway across the row of function keys.

3. Take a look below at the 922 keyboard. That's a true accounting keypad, complete with a Clear Entry, Double Zero and a TAB key. Not merely the numeric keys you get with the VT220.

4. Our SHIFT key is exactly where it should be, so it does exactly what it should do—shift. Their SHIFT key is shoved over by the ⟨ and ⟩ key to create lots of ⟨ and ⟩ on the CRT. Of course with a little practice, you could relearn their keyboard. But why, now that you've seen our 922?

922 Display Screen.

VT220 Display Screen.

5. And after we built a better keyboard, we built a better terminal. With exceptional reliability. Quality. Advanced ergonomics. Everything you'd expect from the industry ANSI leader.

The new 922 is available now and priced to move now. And it's backed by a worldwide sales and support network.

6. Here are 5 more advantages to the 922.

	TeleVideo 922	DEC VT220
Programmable Function Keys	15 (30 with shift)	15 (shifted only)
True Accountant Keypad	YES	NO
Plug-In Graphics Upgrade Option	YES	NO
Full Tilt & Swivel	YES	NO
Enhanced ANSI Mode	YES	NO

Update

Finding and keeping DP/MIS professionals

By Glenn Rifkin
Update Editor

No single method has emerged as a sure way for recruiters to find the personnel they need. . . . And in an environment in which demand outweighs supply, employers find themselves in a tenuous position requiring creative, strategic thinking.

Choose a job you love, and you will never have to work a day in your life.

— Confucius

For DP and MIS professionals, the heat is on. Once an obscure, misunderstood function within the organization, "computer central" is now the focus of unblinking attention. As Fortune 1,000 firms turn the care and feeding of their precious information resources over to MIS, the DP and MIS executive is earning recognition and respect. Coupled with the fact that companies have come to realize that a quality DP worker is hard to find, the profession has prospered under the time-honored traditions of supply and demand.

Though colleges and computer training institutes continue to pour forth eager graduates and despite an industrywide slump among computer vendors, a great demand remains for high-quality, experienced DP professionals (see chart Update/4).

The issues surrounding the recruitment and motivation of quality employees are by no means restricted to DP and MIS. Volumes have been written on both hiring and management techniques in the general business setting. However, finding and keeping DP personnel does have its own special set of problems.

Companies, for example, are often restricted in their search for people by the specific hardware and software expertise they might be seeking and face the question of whether to choose machine experience or the overall quality of a candidate. Universities may produce excellent computer science graduates, but today's market often calls for a more well-rounded business education to complement the technical education.

The continuing shortage of manpower has put the seasoned DP worker in the driver's seat, and job-hopping and increased salary and benefit demands have often resulted. Since DP is a young profession populated by an inordinately large number of young people, there is a dearth of stability in the DP environment. Women have found their own set of problems surviving in the DP world (see story Update/11) and training DP and MIS managers requires special, far-sighted planning (see story Update/17).

In addition, as end-user computing becomes a de facto part of corporate life, DP and MIS professionals often need to acquire people skills to enhance their technical skills, a process often easier to talk about than implement. Also, studies have shown that social needs of DP professionals differ from the needs of other workers, often leading to conflict in the choice of career growth. For example, technical people in many cases simply do not make good managers and have no desire to be managers. Where, then, should they turn for advancement?

Though salary is an obvious motivator, technical people are generally more concerned with the technology and the task at hand. Their loyalty is often aimed at the profession instead of the organization, and companies face the prospect of losing good people if they cannot keep up to date with leading-edge technology.

Confronted with inflated DP turnover, organizations must find innovative ways to intertwine the DP staff further into corporate culture. Rather than have technical personnel feel isolated and unrecognized — viewed merely as an add-on service organization — companies must bring DP into the mainstream and clearly relate it to the corporate business.

Though the issues are complex, answers are being found.

Recruiting and hiring

"Plastics," advised the obtrusive family friend to a reluctant Benjamin in the 1967 film *The Graduate*. That, in a word, he insisted, was the future.

Were the same scene shot today, the advice might be "CICS" or "Unix" or "decision support." And the family friend would instead be the DP recruiter in critical need of staff. Ben would ignore this new advice as he did the old. But DP managers are hoping that other graduates will respond to the opportunities that await them in information systems.

Finding quality DP personnel is a real-world problem without easy celluloid solutions. Because of continuing shortages in a long list of DP and MIS occupations, recruiting and hiring quality candidates requires long-term planning and a commitment of resources. This must often be combined with nontraditional methods that buck practices on which personnel departments have relied for decades.

Entry-level workers are in constant demand. Even more prized by recruiters — and harder to find — are seasoned middle-level programmers, systems analysts, data base managers and operations personnel. "The schools are turning out a lot of computer science majors, so there are many good entry-level people," said Jane Hardy, a personnel specialist for the Gillette Co. in Boston. "And I'm always hearing about people at the DP manager level. What I'm missing are the ones in between, people with three to five years' experience who are doing well and making moves within their own company."

To that end, companies have turned toward such recruiting tools as executive search firms, job fairs and open houses, as well as intensified in-house training programs for employees from other disciplines looking to switch into DP. Though the "help wanted" sections of national publications continue to swell with calls for DP professionals of every

HIRE from UPDATE/3

discipline, personnel experts and DP managers are less inclined to rely on such advertising. Arthur Simonian, director of information systems for Pratt & Whitney Aircraft Group in East Hartford, Conn., said, "We don't believe this is the way to get high-quality people in this business."

No single method has emerged as a sure way for recruiters to find the personnel they need. Organizations have implemented an array of hiring strategies that fill specific needs.

The search for a top-level MIS manager, for example, will take on a vastly different appearance from the search for a dozen entry-level programmers. And in an environment in which demand outweighs supply, employers find themselves in a tenuous position requiring creative, strategic thinking.

On campus

College students are as aware of trends in the "help wanted" pages as anyone, which helps explain the rush for computer science degrees on the nation's campuses. At MIT, in fact, the computer science department is overstocked, according to Robert K. Weatherall, director of career services and preprofessional advising.

"It's becoming more and more obvious that data is playing an immensely influential role in organizations," Weatherall said. "Students here are looking for creative opportunities to shape the way a corporation works. They want to have an impact. They look at someone like John Reed [the new chairman of Citicorp], who rose through the MIS ranks, and dream of similar paths."

Despite the plethora of data institutes and six-month crash courses in programming, recruiters remain committed to college graduates as the No. 1 source of entry-level help.

Pratt & Whitney's Simonian pointed out that the supply lines of recruits "are critical to us." In that vein, his group has worked with personnel to package a "first class" recruiting program that blankets 80 colleges in the Northeast and several others around the rest of the country. "Our predominant hiring source is the college campus," he said.

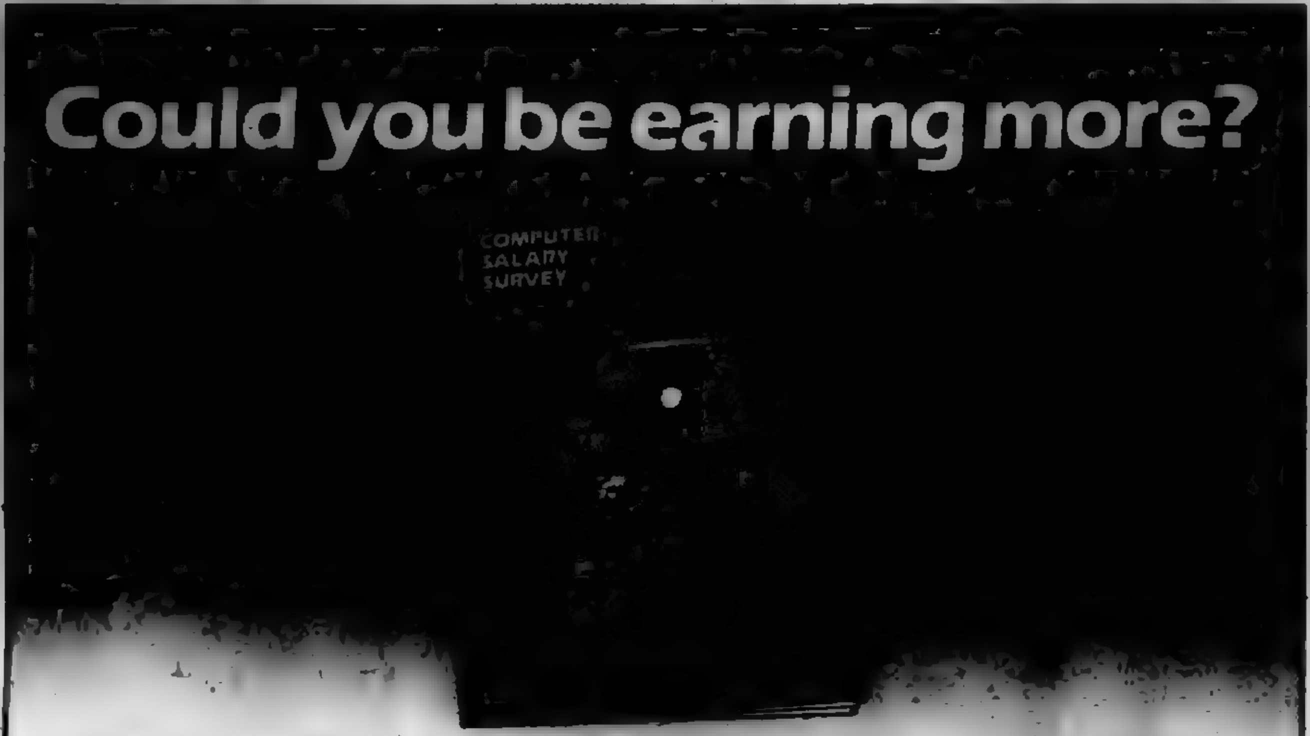
According to Simonian, the key to success in college recruiting has been the practice of assigning DP staff members and managers to visit campuses themselves, either with a personnel representative or alone. These DP-to-college relationships, he said, are not simply one-time visits but formal, ongoing commitments.

"In this way, we keep the school abreast of the kind of work we are doing, which in many cases is leading edge or very advanced work. The students are very interested in that," Simonian said.

Though he was hesitant to single out any particular university as a resource, Simonian pointed out that geographical location is a key factor.

"Georgia Tech may be a wonderful school but not for recruiting in the Northeast," he said. In fact, Pratt & Whitney recently opened a plant in Columbus, Ga., and for two years beforehand, company recruiters visited campuses in Georgia and Florida sowing the seeds for future hiring.

"Finding the right people is tough," Simonian admit-



New, free 1985 Survey shows sharp increases in salaries for computer professionals

With a strong economy, salaries for many computer professionals have soared since 1984 — in some cases as much as 22%!

Our most comprehensive Survey ever

The new **1985 Computer Salary Survey and Career Planning Guide** is based on contacts with more than 48,000 information processing and computer professionals and 35,000 firms that hire them. Included is a review of salaries at sixty-three different position and experience levels. So no matter if you're in programming, systems analysis, design, software, communications, operations, sales, marketing or management; you'll learn whether or not your salary is keeping pace with your peers—and what you can expect to earn as you advance.

In addition, the new Survey includes a number of comprehensive charts, exhibits and graphs which are designed to help you get a thorough understanding of emerging career trends and what you could do to capitalize on them.

Free to computer professionals

The new 32-page Survey is free. Since 1966, we have distributed more than five hundred thousand Surveys to people who not only want success, but are determined to realize their fullest career potential.

You owe it to yourself—especially if most of your career lies ahead—to contact us today.

Personnel Services
The world's largest recruiting firm devoted exclusively to the computer profession. Client companies assume our charges.

Update

ted. "Given the fact that we have a well-organized program, we do it successfully. Without it, recruiting would be very difficult."

Ironically, as the computer science and electrical engineering departments have filled to overflowing, the profile for success in DP and MIS has shifted. According to Michael Lawson, director of the master's program in MIS at Boston University's School of Management, "In talking with business leaders and other academics, there seemed to be an increasing need for people who had both the technical information systems skills and managerial skills."

In the past two or three years, universities have begun to respond to this need by offering increased numbers of MIS courses within MBA programs. IBM, in fact, acknowledged this need by recently awarding $27 million in cash and equipment to 13 universities in order to help improve graduate instruction and research in MIS.

At Boston University, Lawson has taken it one step further and set up a graduate degree program specifically for MIS. Just finishing its second full year, the program has been enthusiastically received both by corporations, which have readily hired its graduates, and students, who recognize "a large and improving career path."

The one-year program provides technical information geared specifically to solving managerial problems. Students are required to form four-person work teams, which are assigned to Boston-area companies for seven-month internships. These students work on an information systems project set up by the company. "They are part of a real systems problem," Lawson said. "It gives them the flavor of how a corporation really behaves."

As the Boston University program grows, demand for graduates increases. Lawson has spotted no particular regional trends in recruiting; students are finding positions across the country and even internationally. He has discovered that corporate recruiters are looking for a mixed bag of talent.

"One of the problems is that everyone has a different notion of what MIS means to them," he explained. "Many recruiters, when they say 'information systems,' are really looking for programmers."

While admitting that there is a continuing high demand for programmers, Lawson described his program as addressing the next level: systems analysts or people who can analyze a business problem and work with both functional managers and technical managers to build a workable system.

"One of the big frustrations out there is that the technology environment is changing so rapidly that it is very difficult to get a handle on things. There are fewer and fewer people who know what is really going on," Lawson said. "The other major frustration is the need to integrate the systems people with the rest of the organization. MIS is becoming an integral part of all functions of a business. For a group that has traditionally operated in a stand-alone environment, it can be a difficult transition."

It is clear that the profile for graduates has changed dramatically. Companies are opting for a more diverse educational background than computer science and in many cases would prefer accounting, finance or engineering majors with some computer experience over the pure computer science major. "The bottom line we look for is high quality," Simonian said. "If a student is a liberal arts major but can display high quality, we'll take him."

Computer training institutes

The television and radio airwaves choked with ads for local six- to 12-month courses that "could quite possibly change your life." Programming courses, in fact, have produced a flood of entry-level people who have found placement in large DP shops.

Though this type of program generally has acquired a good reputation with the industry, the drawback for many of the students is that they graduate from these institutes without college degrees and immediately face a dead-end career path. Without a college degree, growth beyond entry level is extremely limited.

Some institutes have addressed this problem by requiring college degrees before acceptance. The Cambridge Institute for Computer Programming (CICP), an intensive six-month program in Boston, is geared specifically to professionals seeking career changes. CICP supplies graduates to many Boston-area companies, such as Prime Computer, Inc.; Cullinet Software, Inc.; Fidelity Management and Research Corp.; John Hancock Mutual Life Insurance Co.; and New England Mutual Life Insurance Co.

According to Ted Scholl, vice-president of placement for CICP, 80% of the current class will find employment within 30 days of graduation.

"Our students tend to be more mature, in their late 20s or early 30s, and want a career change into DP," Scholl said. "Once they get into a company, they often will continue their education, perhaps going for an MBA with the company's support."

As Scholl pointed out, the requirements for programmers simply have changed in the past five years. Back then, he explained, there was such a demand that "anyone who could spell the word 'programmer' got hired." Today, there is a need for programmers with greater verbal and communications skills. The former teachers and liberal arts majors going through the training programs bring together the two needed disciplines.

The need for programmers remains strong, especially on the East and West coasts, Scholl said. Hardware ultimately dictates the market. For example, there is now a significant shortage of qualified IBM System/38 programmers, he said.

Though CICP graduates averaged starting salaries of just below $20,000 (compared with the low $30,000 range for college graduates with advanced degrees in MIS), most start in the mid-20s and have wide open paths for growth, Scholl pointed out.

"The short programs have been excellent for us," said Tim Billingsley, an employment interviewer with John Hancock. "The graduates are better trained than in universities. Our ideal candidate is someone with a college degree and a certificate from one of these programs. We just hired 20 people from CICP."

For some corporations, especially computer hardware and software makers, it has been expedient to forego searching for the perfect candidate and bring in generic computer science graduates for intensive in-house training programs. Doing so has a tendency, recruiters agreed, to produce increased loyalty to the organization as well as to create the model employee — one who was trained and molded not only in the particular job's function but in the corporate culture as well.

'OK, we want a four-year no-cut with a $250,000 signing bonus and a Trans Am fully loaded.'

In-house training has its drawbacks, however. Though training can be costly, a more crucial issue is time. It takes months for extensive or even basic training, and that can create problems for a DP department that needed help yesterday. In addition, the question of who does the training and how much input that person or group has in the hiring must be answered.

According to a recent Auerbach Publishers, Inc. report by Bruce Winrow on entry-level hiring, if an organization has a formal in-house training department, that department "must establish its role in the hiring process, and senior management must demonstrate its support of that role." Without input in the hiring process, the training department may face a no-win situation.

"Even when the training department must train less-than-ideal candidates, the trainers are held responsible for the new employee's performance. If the training department is judged by the perfor-

The Software Professionals' Job Fair

SOFTFAIR™ 85

SoftFair is different—specifically designed to help you search in new career directions. For the broadest possible view of your local software marketplace, SoftFair brings together technical managers and personnel representatives from 50 or more of each area's most desirable employers. No need for inconvenient phone calls, lengthy cover letters or work-time interviews. Just join us at the site nearest you and see what your experience has earned you at SoftFair.

SoftFair will be held on these days (Monday & Tuesday) from 4 PM to 9 PM at each location (except Washington which will be one day only, Monday from 11:30 AM to 8:30 PM):

Washington, DC
June 3
Washington DC
Crowne Plaza

Dallas, TX
June 3 & 4
Crowne Plaza

Boxborough, MA
June 17 & 18
Sheraton Inn &
Conference Center

New York City
June 24 & 25
Roosevelt on
Madison Avenue

Exciting career opportunities are available for experienced software professionals in a variety of Software Engineering, Scientific and Business Applications areas related to development, support, implementation, training, quality assurance, technical writing, sales, marketing and management.

A minimum of two years' on-the-job experience is required.

If you can't attend SoftFair, send a resume indicating the location in which you are interested for distribution to attending companies. Software Career Link, Dept. CW325, 67 South Bedford Street, Suite 400W, Burlington, MA 01803. (617) 229-5813.

SoftFair '85 is sponsored by Software Career Link serving equal opportunity employers.

HIRE from UPDATE/5

mance of its trainees, the training manager should have some control over the quality of the candidates," Winrow said.

Despite the drawbacks, recruiting inexperienced entry-level people continues to offer a positive alternative for many organizations.

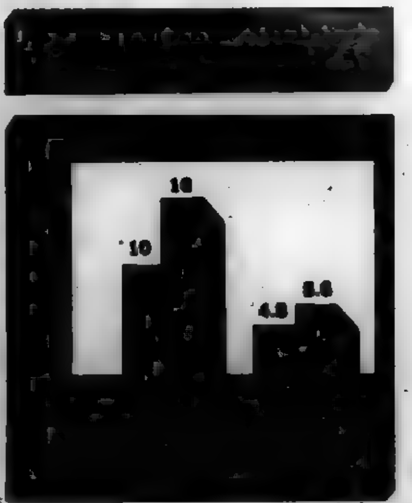
Management Science America, Inc. (MSA) in Atlanta, a leading software manufacturer, has been staffing its pool of software developers since 1979 with recent college graduates who are then entered into an intensive six-month training program. This year, according to Ken Millen, MSA's vice-president of personnel, the company has hired 150 students from 50 campuses to enter the program. MSA has hired more than 350 software developers in this fashion — about one-third of its employees — and the turnover rate among these employees is half of the company rate.

"We feel that these will be the key people in the company in five to seven years," Millen said. "It's an investment in the future."

At the Bank of America in San Francisco, the DP department, which numbers between 5,000 and 6,000 people, averages 400 openings during any given week, according to Gary Damiano, senior staffing specialist. Though many of those positions are for traditional Cobol programmers, the bank needs professionals with experience in the high-volume transaction utility called airlines control package/transaction processing function (ACP/TPF).

That technology, which until recently was relegated to the airline, hotel and car rental industries, is spreading to banks and financial services organizations, creating a huge demand for skilled people. Unfortunately, there are only about 3,000 technicians in the world with ACP/TPF expertise, Damiano said, and those who know it are demanding high salaries. To solve this problem, Bank of America is recruiting and training recent graduates in-house.

"It just makes sense to grow our own," Damiano said.



Update

The rapidly changing demands of high technology often do not afford corporations the time or luxury of bringing in and training needed DP personnel. According to Billingsley, the competitive nature of the business forces companies to forego in-house training for every position.

"Many companies have to stay at the leading edge, and they are willing to pay for it," he stated.

Finding experienced DP personnel with specific knowledge of particular systems is difficult and frustrating. Corporations have turned to executive search firms, in-house promotion and referrals and job fairs to enhance newspaper and radio advertising.

Lawson

According to Christine Suarez, a consultant programmer in Boulder, Colo., companies looking for the "perfect fit" of hardware or software experience are often forced to "bite the bullet and wait." In the Boulder area, she pointed out, there has been a recent and unusual glut of DP professionals because of layoffs at major employers like Storage Technology Corp.

"DP opportunities in Colorado have shifted," Suarez said. "They used to be dynamic, but there hasn't been any new development in the last couple of years."

The result, she said, is that companies are willing to wait and look longer for specific talents.

"Someone might have a good knowledge of the VS operating system but won't know CICS," she explained. "It's hard to find someone who has both, and it's tough to get the hard-core DP person to think about the people part of it — to hire someone with close enough skills who could adapt quickly."

Among the methods for finding potential experienced hires is the job fair or open house. Companies like Bank of America, with its 400 openings, find it both practical and expedient to hold open houses for prospective employees.

"We used to go strictly through agencies and advertising, but we're changing that," said Bank of America's Damiano. "We spent $2.5 million last year on agency fees, and we're not going to do that again. We can hold two open houses per year for $40,000 each and end up with 20 to 30 hires per open house."

For an organization with a large number of open positions, an open house provides an excellent setting to match prospective candidates with the perfect job.

"We have 20 different units within the bank looking for different technologies," Damiano said. "The open house allows the candidate to come in and talk to the hiring managers. We do resume tracking and retrieval on all candidates to make sure that they are exposed to all the positions in which they might fit."

For companies with smaller scale needs than Bank of America, professional job fairs, in which dozens of local organizations set up booths, are increasingly popular.

According to David M. Callahan, head of Software Ca-

COME TO A DECISION NOW. FOR IMPROVED S/34/36/38 WORK STATION PRODUCTIVITY.

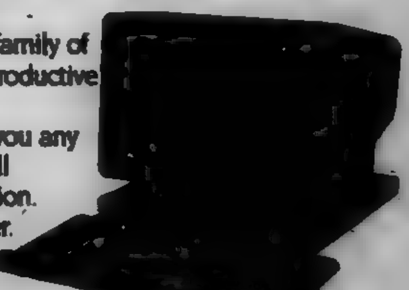
It's time to stop talking about more work per dollar and do something about it. By installing cost-effective Decision Data work stations for your IBM System/34/36/38 right now.

Decision Data has developed a whole family of economical work stations with improvements that increase productivity and add operator comfort. Models with glare-free green or amber screens that tilt or swivel for easier viewing and reduced fatigue. Palm rests to keep hands from getting tired. And other details that have been thought through for convenience, such as highly visible status indicators, and as obvious as it may seem, an on/off switch that's placed up front for easy access.

In short, Decision Data gives you more of the features, comforts and capabilities you need, at prices that are more attractive, backed by nationwide and worldwide service that makes you feel more comfortable.

It's easy to understand why Decision Data makes and sells more peripherals compatible with the most popular IBM business-computer systems than any other company. Including the CWS, a display work station that also operates as a compatible Personal Computer, plus the rest of our family of printers and other productive peripherals.

But they can't do you any good until you install them. It's your decision. The sooner the better.



Decision Data Computer Corporation

Box 52061, 400 Horsham Road, Horsham, PA 19044

Buffalo, NY 14202
(716) 842-0801
Personnel Agency

Update

Finders, keepers

Though their disciplines are quite different, Robert Half and John Diebold have a few things in common. They both have, for example, several decades of experience in their respective fields, and each is sought after by the powerful and influential for advice and consultation.

In fact, both men have founded and fostered highly successful businesses that have become known and respected in this country and around the world. Though each has stepped back of late to package his insight in book form, both Half and Diebold continue to have a global perspective on their areas of expertise.

Half began his recruitment business with one office in New York in 1948. A certified public accountant, he saw early on the value of a professional recruiting firm that specialized in accounting. As his business thrived, he started to franchise offices and began to recruit heavily in the DP field. Today, as president of Robert Half International, Inc., he oversees 90 offices worldwide. He is the author of the best-selling book *The Robert Half Way to Get Hired in Today's Job Market* and the just-released *Robert Half On Hiring.*

Diebold is an internationally acknowledged leader in the fields of management and technology. He is also chairman and founder of the Diebold Group, Inc., a consulting firm that he established in 1954. Diebold gained international recognition with the publication of his book *Automation* in 1952 when he was just 26. For more than 30 years he has consulted with both industry and world leaders on computers and automation. Diebold's *Making the Future Work* was recently published by Simon & Schuster.

Computerworld Update Editor Glenn Rifkin met with Half at his Palm Beach, Fla., home to gain insight into ways to find quality DP and MIS professionals and with Diebold in his New York office on ways to keep them.

INTERVIEWS

What are some of the issues involved in DP hiring as opposed to general business hiring?
Half: DP is different. It has to do with the fact that DP is a young profession compared with law, accounting, medicine or engineering. And since the profession is very young, it employs mostly young people. Older people didn't get the basic training in school, so it's harder for the industry to absorb older people. However, the fact that there is a youth generation in DP lends itself to very high turnover. The young are more impetuous, quicker to make a change.

If DP shops are looking for stability, they should try to train older people, and they would not get that rapid turnover. Raise the age level, do something about it. Every time you walk into the DP department, you see a different face. It's very disturbing, very hard to get anything done.

How do you get the older people?
Half: The same way you get the younger people. It's a little harder, but they'll want the jobs more. You may have to do training, but you have to do training anyway. You can't get a programmer who can fit into an operation right out of a programming school. Most of the schools aren't all that good, so it's up to the company to train the individual.

If you get a person, say 40 or 50 years old, and train him or her, you've got someone who is more likely to stay. I'm not suggesting you don't hire younger people, but you need that balance. The balance doesn't exist [in DP]. It exists in all other professions but not in DP to a great extent.

Do you have a profile of the perfect DP employee?
Half: No, because it wouldn't do us any good. The perfect person for you would be completely different than for the company across the street. What does a profile mean? Nothing. What does a company want? Whatever they want, they're right. If we think they are wrong, we'll tell them. But they may be right, and we could be wrong.

Who does the hiring in DP?
Half: In hiring, in almost all cases — 95% to 100% — personnel does not do the hiring. They do the selecting. The DP manager does the hiring. And the person doing the hiring often absolutely wings it. They have no particular knowledge of personnel problems. They may not even be acquainted with the laws of the land having to do with [hiring] discrimination.

The DP candidate may not have a flamboyant personality, and the interview may not reveal anything other than that the person is technically competent. Is that enough?
Half: I developed a form called Hire. You rate the person's education, experience and other factors according to a predetermined standard. I rate innate ability and willingness to do the job as more important than anything else.

'If you ask individuals what motivates them, chances are, most won't say money. But wave some bucks, and chances are they're going to change.'

Robert Half

What I've done is given tremendous weight to those two factors, so that if a person rates well on education and experience but on willingness and innate ability rates poorly, he probably won't get the job.

That's a tough thing to catch in a short interview.
Half: Very tough. But that's the way, when you can do it, that you get really good people.

You feel that the person doing the hiring in DP is not qualified to handle that chore?
Half: He or she is full of prejudices — not race, religion or color — but other things, like size or height or a personality trait — flamboyant, conservative. And that same person on the top of that pyramid doing the hiring is winging it, and he is often wrong. And the main reason is that he is hiring someone too strong who immediately becomes unhappy.

Where are the best places to find good DP people — universities, computer schools, other DP shops?
Half: It depends on what we are looking for. All those places can be the best. If you are looking for a beginner, you should look in the environments you mentioned. If you are looking for heavy experience, it's got to come out of installations just like yours. There's not much point in hiring people to do DP at a higher level who don't know the first thing about your languages or your equipment.

Is that a major criterion for searchers — that people know the hardware or software they have?
Half: Yes, but they have to understand that there is some hardware and software closely enough related.

If you get too specific, you are dealing with such a narrow market that the probability of getting the right person is remote. Hopefully, you'd find if you had an IBM installation that certain Burroughs Corp. equipment might be close enough that the person working on Burroughs [machines] might move right in without too much training. Better to get the good person and train a little than just get someone who will be here today and gone tomorrow.

How do you counsel companies in the ways to look for people?
Half: We try to highlight the similarities between systems that the company has and systems the candidate has worked on. We also point out that when the candidate got his last job, he had the same problem and was able to make an adjustment. That would be evidence. Hiring in DP is tough. I would not want to be a DP manager and show up every week saying 'Who is gone today?'

When someone with three to five years experience is seeking a job change, what are the key issues?
Half: I still believe that money is the most important factor. If you asked, a candidate wouldn't put money first because it's not the nice thing to say.

But I believe money is the greatest motivator. And a company can probably save money by paying slightly more than market rates. They'll save money because they'll have less turnover. That automatically takes care of it.

Benefits help lock employees in as well — good corporate benefits, profit sharing, pension plans, good insurance. If somebody says 'Charlie's wife is in the hospital, but it's not covered by our plan,' that upsets people.

At higher levels of DP management, is money also the chief motivator?
Half: That's still my belief, in spite of what the studies show. When someone is on an interview show, and is asked 'Why did you write the book?' did you ever hear anyone say 'money'? They wrote it for some other reason. It's the same way if you ask individuals what motivates them the most. Chances are, most won't say money first. It's not the right thing to do. But wave some bucks in front of them, and chances are they're going to change.

What is your outlook in this area over the next five to 10 years?
Half: As time goes on, you will see more stability in DP. If the turnover rate is 40%, it will drop to 20%. It will be more normal. There has to be a settling-down period. If nothing else, the young will be getting older; their mentality will change. They will be more willing to stay put. That may be the single biggest change we'll see in time. ■

Update

In your latest book, you mentioned that the systems that American businesses will need to select, develop and motivate managers are going to demand some rethinking. What do you mean by that and how will it impact DP and MIS shops?

Diebold: If you want to make an unduly simplistic but nonetheless realistic characterization of American personnel policies, it would be fair pay for essentially average work. It is a kind of homogenization. The problem with that is that it doesn't allow for the exceptional. And as you get into a world in which the differences can be enormous in terms of the value of an exceptional person as opposed to somebody who is simply good, you get into discrepancy problems. [These problems] are very tough to solve under our existing personnel philosophies.

In the computer field, talent is viewed as capital but is not recognized by the accountants and personnel policies. This view tends to catapult people out of large organizations into start-ups and small organizations where there is a big premium put on talent.

Do you have any suggestions about how to deal with this?

Diebold: One approach is to try to provide more freedom for particularly gifted people. One could put in some exceptional rewards and allow for flexibility. The technology itself offers some solution in a sense that individuals can live in a rural community if they want and have a much better chance of participating in a variety of businesses than was true a decade ago. I think that will be more true as we move ahead. But it is a difficult problem to solve.

As information technology changes the terms of competition in more and more industries, one of the problems that we are being asked to focus on is: How does one bring together the knowledge of information technology computers and communications and use them most effectively? How do you bring that together with an understanding of the markets and of the business itself? If the technology allows you to have a completely different approach to what you sell, then you can't reasonably expect that that's going to be achieved by people who are oriented primarily toward a staff support function.

Yet data processing people tend to be more loyal to their profession than they are to the firm in which they are working because, in many cases, they are so isolated from the business itself.

Diebold: The premium now is much more on people who genuinely understand the nature of the industry they are in and how the industry will change.

As an organization as a whole, not just as an MIS organization, you need to find ways of getting much more of an entrepreneurial view of the business in the direction of the MIS department.

Isn't that somewhat idealistic, though, when you are talking about the programming and entry-level operators? How can one reasonably hope to get those people more involved in business when the nature of the job doesn't lend itself to that at all?

Diebold: It is a question of the direction of it. The need to be innovative and creative and to carry on with this much broader global perspective that's now required still does not get rid of the routine jobs that they have come to do very well. So the way the MIS department measures itself has got to change because it is too easy to say that we are doing a job better than we did before in the traditional terms and not in the new terms.

What are the key factors in motivating data processing people?

Diebold: One of the key things is to allow them to see that the work they do is actually being used and is helping to change things. One of the more effective means of motivating good people is to give them the opportunity to see that they are actually playing an important role in the organization. All too frequently there is not enough done in high management in terms of letting people really understand how important their role is.

It was clear from the responses to a survey we did a couple of years ago that it was not money that was the prime motivator at all. It was the sense of doing a responsible job, of being rewarded for assuming greater responsibility. There is much more focus on someone getting a richer life out of their work. Companies that put good human resource policies in place earlier on in the tight labor market are at an advantage now. And others that treated DP and MIS people as simply expense items must opt to change their work style and culture.

So recognition is really the key factor.

Diebold: Recognition, responsibility and the opportunity for creativity.

Are companies starting to realize this?

Diebold: Yes. For example, Traveler's Insurance Co. now has 9,000 personal computers, and they are increasing that number at a very high rate.

Everybody in the traditional part of the organization is aware that the MIS activity is a major factor in changing their competitiveness. That provides good psychic income to the MIS organization.

What about the opportunities outside of DP and MIS that were traditionally off limits?

Diebold: You see that the user departments have a lot of action going on and have a lot of need for MIS skill, some of which is being provided by training themselves, but some of which is being provided by support from MIS and some by actual personnel trades. You therefore have a change going on in the kind of personnel that you need in a large MIS operation.

The role of the MIS organization is changing dramatically and it is becoming more of a policy-setting organization, and the kind of people you need in the MIS operation are changing as a result.

With turnover being down, as our studies have shown, in some cases attrition is not taking care of the shift that is needed. Normally you would be able to orchestrate that kind of a change over a couple of years because people would leave of their own volition. That isn't always the case any longer.

So now you have to retrain those who are already there?

Diebold: Yes, and the question is whether people do or don't have an interest in doing the new tasks. There is a great premium on people going into MIS who, while in it, get a much broader business orientation and much more management orientation. The opportunities are enormous if they have that.

You mentioned that turnover is going down and yet job-hopping is still one of the major problems in this field.

Diebold: As I said, it is much less of a problem today than has been the case for a long time in the industry. The rates are really very far down.

To what do you attribute that?

Diebold: It's due to the fact that it's no longer a new industry. For a long time the computer field was really a very new industry growing at an explosive rate, and you had very few people who knew about it. It is very hard to imagine someone graduating from business school today without having a full understanding of computers. A typical business school graduate is likely to be a well-qualified user at this stage, so you have an enormous increase in supply. The supply of people who are computer literate is 20-odd million people. A few years ago, it was less than three million.

And yet, I am still hearing people reporting great shortages in DP talent.

Diebold: I am not saying that it has gone away completely. But it is very different type of problem.

What are the figures on turnover?

Diebold: In the '81 through '82 time frame, we were looking at a 15% to 20% attrition rate. In major metropolitan areas it was much higher. Now it is down to around 5%.

What that means is that, roughly every 18 months to two years, you could expect half the people in the department to be new. And now we look at that happening say, every five years. So, a lot of the people you have working for you now will still be with you in the future.

The climate, though, has changed, in the sense that more and more people are coming into the market. The number of new openings is less, so the opportunity for each job seeker to find something new has decreased, and there is, I think, a growing prejudice against job-hoppers in the field. Our clients in general have become a lot more selective about who they hire.

DP professionals have been typecast as lone wolf types with low social interaction. How will this person have to adapt to fit into the organization of the future?

Diebold: For exceptionally gifted people, there is a very real premium on creativity, and organizations are willing to tolerate a considerable amount of eccentricity for that. On the other hand, all the forces are moving toward a person having much more of an understanding of the human being in business.

Also, the mainstreaming of computer knowledge in society now is clearly going to change that perspective. There is a much larger pool of people who are going into computers. They are not the same self-selective bunch who, by temperament, like working alone.

For awhile, a lot of the more entrepreneurial and outgoing sorts really ended up going into more entrepreneurial companies. As the expansion that we have seen over the last five years with the electronic industry slows, we may see more of those innovative people going back into some of the corporations. ■

HIRE from UPDATE/7

reer Link, which sponsors 50 "Softfairs" in cities around the country, every company that participates averages 3½ hires per fair.

The format, Callahan explained, is advantageous to both the recruiter and job seeker. To gain entry to Softfair, a prospect must have at least two years' experience in some software-oriented discipline that is DP and/or MIS related. In surveys of attendees, the average experience is actually closer to eight years, Callahan said.

The fair setting allows recruiters to meet an average of two people per minute if they desire.

For attendees, the job fair offers an opportunity to shop around and see what is available without making dozens of phone calls or knocking on doors. It gives recruiters and prospects a chance to meet face-to-face rather than through the mail, Callahan stated.

"Most people feel this is a less threatening environment for job hunting," he said.

John Hancock's Billingsley, who must hire up to 100 entry-level people per year, is a firm believer in job fairs. "You find more good people at a job fair than through an agency, and it saves the company a lot of money as well," he declared.

The drawback to a fair, of course, is that dozens of corporations are on hand, and most are looking for the same qualifications. In the software arena, people with experience in data base management systems, IBM's IMS or data communications are in high demand, Billingsley said.

"We're competing with five or six groups here that are looking for exactly what we are," he acknowledged. "If an applicant is good, he or she could come out of a single fair with five or six offers."

Though job fairs and open houses have proved to be highly effective in volume hiring, the tools for filling specific experienced positions under tight deadlines are limited.

Some enlightened DP organizations have started formalized internal employee referral services, which have proven highly effective. DP personnel tend to have a strong sense of the employment market through professional associations and loyalty to the technology.

They often know of a friend or professional colleague seeking a job change long before anyone else, and recruiters agree that this resource is worth cultivating.

Experienced DP personnel, realizing the value of their services, have turned increasingly to professional placement firms to find new opportunities (see story Update/6). Corporations faced with the prospect of paying large sums to the search firm (generally a percentage of the candidate's salary) are reluctant to use placement agencies if it can be avoided.

Gillette's Hardy acknowledged that she uses agencies

The future of high tech electronics is right at home at E-Systems in Dallas.

At the Garland Division of E-Systems, our primary objective is concern for you, our employee. We demonstrate this concern in areas that include superior technological programs, innovative work environments, and an excellent compensation package. E-Systems Garland Division is seeking engineering leadership in the following areas:

Contact Gary Hunt for specific information about these Senior positions:

PROJECT LEADERS

Responsible for assisting software development managers with definition and implementation of tasks in software project planning, procedures, Unit Development Folders, proposal writing and cost estimation of government-type programs. BSCS, EE or Math with six plus years experience. Experience with VAX, PASCAL and MIL-SPEC standards required. These individuals will eventually assume roles in software management.

SENIOR SOFTWARE ENGINEERS

Responsible for implementing the tasks defined below on software development projects. These engineers will report to project leaders. BSCS, EE or Math with six plus years experience in definition, design, development and delivery of software systems, utilizing VAX or Motorola 68000 computers. Required fluency in PASCAL, structured FORTRAN, MACRO-11 or Assembly languages. Experience with MIL-SPEC standards required.

SENIOR VMS SPECIALISTS

Responsible for definition, development and enhancement of software development environment on VAX systems, BSEE (MS) or CS with seven plus years related experience with VAX systems in PASCAL fluency required. Must be VMS internalist within I/O driver systems. Defense environment background a plus.

Bob Webber will give you a frank discussion regarding the following:

SOFTWARE ENGINEER

Responsible for design, coding, and testing of systems level software. Position requires minimum of BSCS or BSEE degree with at least two or more years experience with the VAX 11/750 or 780 and VMS operating systems. Experience in one or more of the following areas is desirable: MIL-Standard documentation, UYK series computers and real time signal processing architecture.

BUSINESS PROGRAMMER ANALYST

Responsible for development and maintenance of on-line systems in an IBM OS/MVS IDMS CICS environment. Must have a college degree in Business, MIS or related field, and three to five years experience developing/maintaining on-line systems, supporting Accounting, Manufacturing or Purchasing/Inventory control.

DATA BASE ADMINISTRATOR

Responsible for the installation of IDMS in an IBM OS/MVS environment, for the design and maintenance of the data base and related data dictionary, and for the development and enforcement of standards and procedures for its usage. Requires a college degree and three to five years data base Design/Administration experience.

The Garland Division of E-Systems is impacting the future of electronics with exciting new projects that offer challenge and recognition. You can participate in an advanced human resources program which includes a flexible employee benefits package (FLEXCOMP), and a company-paid Employee Stock Ownership Plan. With Dallas recognized as being one of the most enjoyable and livable areas in the United States, the Garland Division of E-Systems can offer the senior engineering professional what is needed.

If joining E-Systems in Dallas means a move, E-Systems will offer you a personalized relocation program. We realize the difficulties of acclimating an individual or a family group to a different living situation. Our staff makes it a point to assist you and your family members after you have made the decision to join a company embarking on the most advanced programs in existence. Our dual assistance program is designed to ensure your move to E-Systems in Dallas will be a step forward in every area of your professional and personal life. For a personal reply, please write Senior Staffing Representative Gary Hunt or Bob Webber at: E-Systems, Inc., Garland Division, P.O. Box 660023, Dept.41, Dallas, Texas 75266-0023.

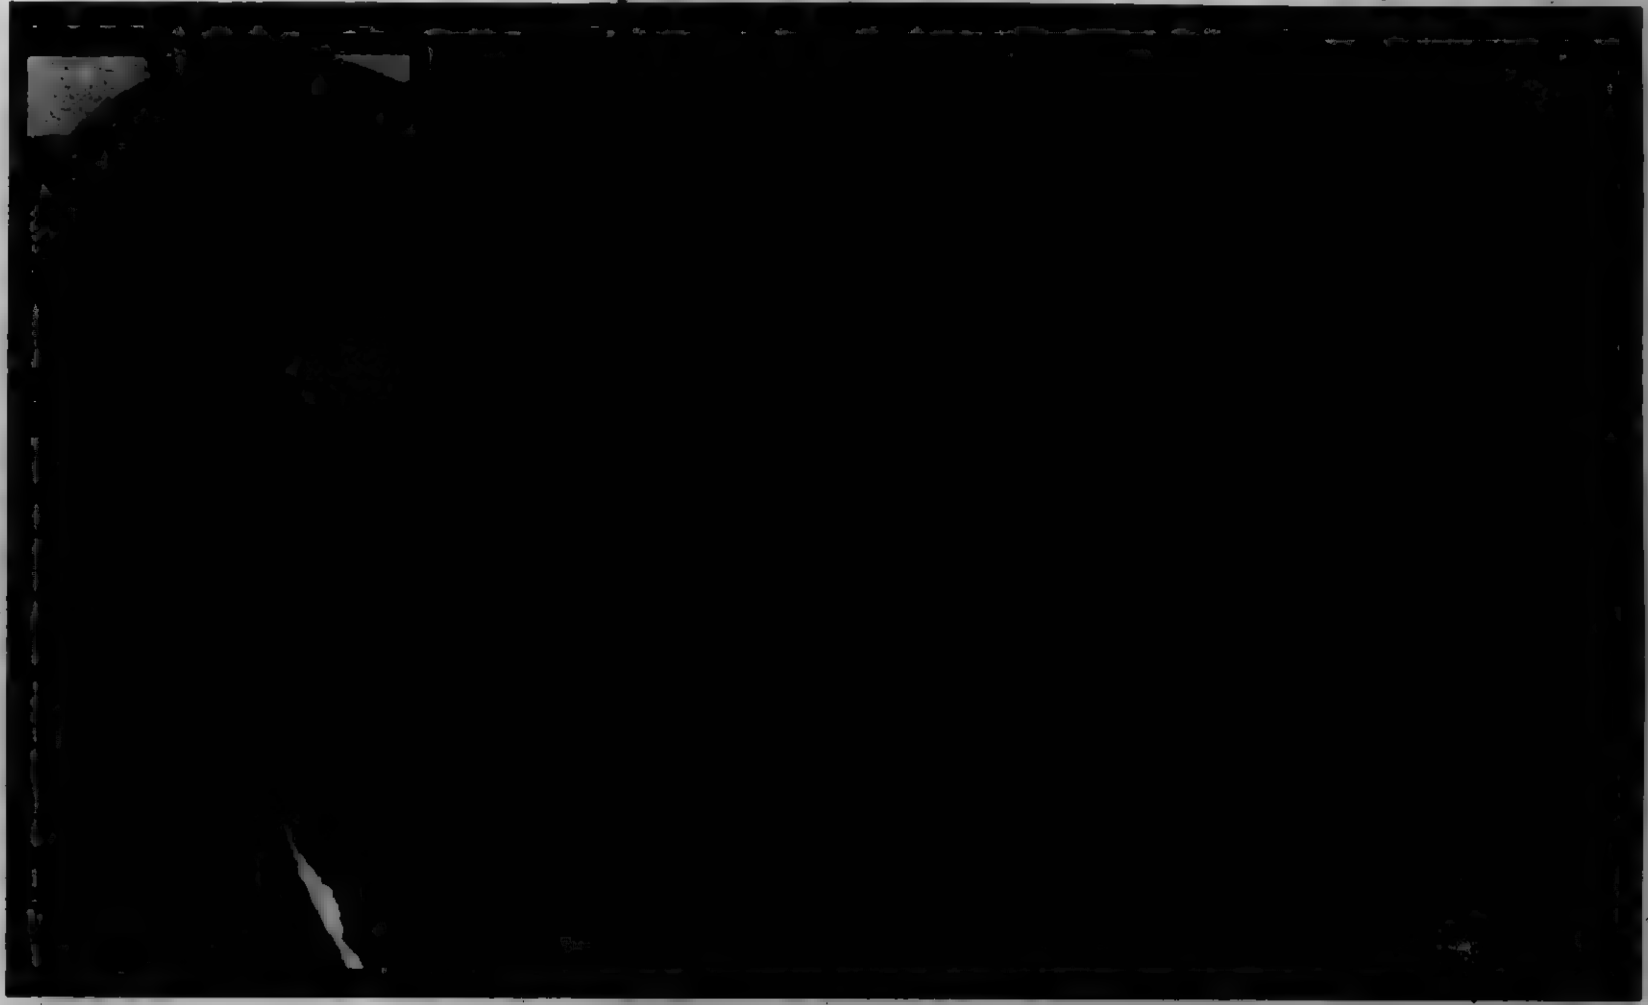
Update



Whether you win or lose . . . depends on the moves you make . . .

The opening moves in a game of chess predetermine the outcome of the entire game. If you are wise the right moves can lead to an easy win. If you are unwise the wrong moves can lead to a painful loss.

In many ways the same is true of your computer career. After two or three years of experience you are ready to make the opening moves in your career advancement. But, just as in chess, you need a great deal of experience to know which moves are the best for you . . . and you don't have the necessary expertise required.

But we do! That's why you really need NCA. We can show you more, completely detailed, career opportunities, both locally and nationally, than you are likely to find elsewhere. Furthermore, our long association with employers has given us the inside information that is needed to help you to determine your best career moves.

All of our specialized services don't cost you one cent because employers pay our fees. So, if you're ready to make your opening career moves, you'll make them most wisely by: coming in, calling or mailing your resume to the NCA firm nearest to you.

TELECOMMUNICATIONS AND

ONCE UPON A TIME THERE WAS A KNOT NO ONE COULD UNTIE. It was a huge, hopeless tangle of rope and vine that had defied the best efforts of people from all over the world.

Ancient soothsayers claimed the knot was formed by Gordius, legendary King of Gordium. "Whosoever shall untie the Gordian Knot," said the soothsayers, "shall have all of Asia as their reward."

All of Asia, the fabled land of mystery and magnificence—what a prize!

Yet for centuries, no one had succeeded in unraveling the Gordian knot. Kings and wisemen, warriors and wizards: they all tried, and they all failed.

Then, in the year 333 B.C., a mighty Macedonian King arrived on the scene. Flanked by thousands of his troops, and armed with one of history's finest and most creative minds, Alexander the Great stood transfixed before the great Gordian Knot.

A hush swept through the ranks as all eyes turned to Alexander. Suddenly a flash of inspiration lit up his face. And with one bold and innovative stroke, Alexander untied the untie-able. Grasping his sword, he slashed through the knot with a swift decisive blow. And went on to rule all of Asia.

Today, the world has changed. Dramatically. But the need for innovative thinking remains the same.

Especially at BNR (Bell-Northern Research), where our R&D expertise has enabled our parent company, Northern Telecom, to become the largest supplier of fully digital communications systems in the world. At BNR, we not only appreciate the bold new ideas of our engineers and scientists—we also reward them.

As a world leader in the evolution of telecommunications and information management products, we are committed to maintaining a two to three year lead over the competition.

So come join the quest. Call our toll-free number 1-800-522-1500, ext. 145. And help us untie the Gordian Knots of today's technology.

The prize? A great career with a company on the cutting edge of the future.

BNR

WHERE FINE MINDS MANAGE INNOVATION.

from UPDATE/10

to fill a majority of open positions but tries to avoid that route for entry-level slots. Under a time crunch, however, a headhunter may, in fact, be the most effective recruiting tool outside of internal promotions, she said.

Looking in-house

Most corporations are required to seek internal candidates for open positions, and this method for filling both entry-level and upper-level spots is essential for both finding and retaining quality people.

At Eastern Airlines, Inc.'s Miami Computer Center, Joe Rodriguez, the center's director, works closely with Anthony Labay, an Eastern personnel manager, to fill needed positions. Though Labay uses a wide range of methods for recruitment, the company's policy is to promote from within when possible.

For entry-level positions, Eastern employees, particularly in the operations area, can make the switch into DP by passing an entry-level test. They are then given extensive on-the-job training.

Some corporations understand that the loss of a key technical person can devastate the DP organization, and so they institute formal succession planning programs.

Succession planning can be as simple as designating successors to each management position, or it can encompass detailed career planning proposals and the ripple effect those will have on the entire organization.

Succession planning not only works as a logical and less disruptive means of replacing key personnel but is also a motivating tool for lower level employees anxious to know where their career path is heading.

Though hiring from within is a preferred method of finding DP staff, it has drawbacks. With the ever-changing face of technology, refusal to look outside will inevitably create a stagnant atmosphere.

"You need new blood, new experience coming in," said Eastern's Rodriguez. "Training someone in-house tends to make that person focus on just the particular system they are working on. Soon you find your overall expertise is dropping. So you need experienced people from the outside."

Finding the right people is only half the battle. Hiring them is the trick. Knowing they are in strong demand has created a buyers' market for DP and MIS professionals. A qualified computer professional might be courted by several offers. It will take more than a competitive salary to attract him.

Conger

Even corporate recruiters in need are quick to point out that they avoid job-hoppers. "I know the market is mobile," said Noreen P. Reilly, an employment representative with Shawmut Bank of Boston, "but I don't want someone who has had three jobs in two years."

As it becomes increasingly difficult to find both experience and stability, corporate DP and MIS shops are learning from both internal personnel and outside placement services what factors draw the best people.

The determining factors may well be the following:

- Geographic location.
- Nature of the work.
- Nature of the business.
- Chance for advancement.
- State of the technology.
- Corporate culture.

Recruiters said that large cities tend to be obvious magnets, and supply and demand in urban centers remains high. Programmer gluts have appeared in isolated cases, such as Houston, where problems in the local oil business have hurt many professions. But hiring on a regional basis continues to be strong (see chart Update/5).

The high-tech belts in Northern California, Massachusetts, Texas and North Carolina are also excellent spawning grounds for computer talent. But drawing that talent away to more remote areas takes both money and a combination of several of the above-stated characteristics.

Salary, most experts concurred, has to be competitive. Once that issue is addressed, the job itself is of greater influence. "When people work here, they know they are building skills that will make them very valuable," Simonian said.

Being at the leading edge of technology is also an essential recruiting tool. The major vendors like IBM, Digital Equipment Corp., Hewlett-Packard Co., Cullinet and others have little trouble attracting high-quality technical people who would rather help create the latest bells and whistles than maintain a five-year-old system.

Such high-tech industries as aerospace or electronics, which are utilizing the latest technologies, are also hotbeds for DP staff. And as technology begins to affect the Fortune 500 companies as never before, other conservative industries such as banking have changed.

"Five years ago, when banking was a regulated industry, it was the last place college graduates wanted to go," Bank of America's Damiano explained. "Now banking has changed dramatically and is as high-tech as any business in the country. If someone can come into Bank of America and make the system work, they can do it anywhere in the world. Our systems are immense, and that is a hell of a selling point."

SYSTEMS PROGRAMMER

The Ochsner Medical Institutions, a major health care employer in New Orleans, is seeking a MVS systems programmer. We have an IBM 4381 plus an IBM 3081 and are expanding our computer operations department. Experience with MVS and JES-2 is preferred, also knowledge of adabas complete and natural is a plus. The Ochsner Medical Institutions are a premier Clinic, Hospital, Foundation and Hotel located in suburban New Orleans, a city with a beautiful climate and a variety of entertainment. This job offers excellent compensation and benefits including relocation.

Update

Keeping the good ones

Finding high-quality DP and MIS staff is one (not-so-easy) thing. Keeping those same people happy, motivated and in-house is another. DP and MIS departments must cope with the reality that supply does not meet demand and that, coupled with a spate of complicating factors inherent to the profession, has made retention one tough task.

In a field where the turnover rate has reached 20% or higher for some organizations in recent years, the cause for alarm is real. Management has grown tired of peering into the DP shop on any given morning and seeing unfamiliar faces. With new interest in the issues surrounding retention of DP and MIS staffs, corporations have started bringing stability to these technical staffs, and evidence of this enlightenment is beginning to surface.

In a 1984 study called "MIS and Telecommunications Budgets and Key Indicators," the Diebold Group, Inc. found that turnover in MIS departments of major corporations had dropped to 5.6%, by far the lowest point in the five years that the study has been done.

According to J. Daniel Couger, professor of computer and management science at the University of Colorado, the Fortune 500 has seriously begun to address the issues surrounding motivation of the DP staff. In the past 10 years, he noted, managers have recognized that technology is not the sole answer to keeping people happy. "For the first time in our industry — and I've been in it for 25 years — managers seem to be more interested in the holistic approach, looking at behavorial issues as well as technical issues," Couger said.

Despite this upturn, much remains to be done. The often-heard comment that DP professionals have more loyalty to the profession than to their employers continues to ring true in many cases, and an increased effort is being focused on changing that.

Motivation value

Motivated employees are like diamonds: They are rare and in demand. Though it can't be quantified, the difference in productivity between a motivated and a complacent employee is dramatic, and countless studies and books have been written about better ways to turn on the help. According to the best-selling book *In Search of Excellence* by Thomas J. Peters and Robert H. Waterman Jr., "Researchers studying motivation find that the prime factor is simply the self-perception among motivated subjects that they are in fact doing well."

In DP, that self-perception is often difficult to attain. Data processing, for example, is often cited as the scapegoat for internal problems and has also been called unapproachable by the user community. If management accepts this, DP staff members can become frustrated with the company.

[illegible]

Reasons	Total %
[illegible]	[illegible]
Compensation	15 - 3
[illegible]	[illegible]
Challenges elsewhere	6 - 12
[illegible]	[illegible]
Location	3 -
[illegible]	[illegible]
Competition	2 -
[illegible]	[illegible]

In a report for Auerbach Publishers, Inc. titled "Motivating DP Personnel," Frank Stanley of the Computer Task Group, Inc. wrote, "Using motivation techniques from the managerial level on down can significantly improve employee morale and self-image, which is reflected in their attitude and work. As a result, the department may be perceived more positively within the organization."

Among the key factors generally agreed upon as motivators for data processing and MIS staff are recognition, challenging work, growth paths, access to state-of-the-art technology, salary and communication. As Stanley pointed out, motivation can dramatically reduce employee attrition.

Why they leave

Just as salary is generally not the key factor in recruiting, it is also not the most important motivator for keeping employees. In DP and MIS, according to Couger, the most important motivator is unquestionably the work itself. Madeline Weiss, a Washington, D.C.-based management consultant, recalled a top systems analyst who turned down a lucrative job offer and said, "I've done that job. I wanted something different and new." An unchallenged employee is soon to be an ex-employee.

See HIRE UPDATE/16

PROGRAMMER ANALYSTS
Reno, Nevada

Data Processing opportunities in the Biggest Little City in the World are few and far between. Employment with Sierra Pacific Power, Northern Nevada's largest D.P. employer, would allow you to maximize professional growth while enjoying the type of low congestion — low crime — outdoor family lifestyle found only in a Sierra Nevada recreational area like Reno. If that's not enough, we're only 45 minutes from the ski lifts and aquarium-clear water of world famous Lake Tahoe.

The successful candidates for the position we have open will use their professional skills in COBOL and CICS in support of corporate applications in Engineering, Customer Support, General Accounting and more.

Our environment features an IBM 3083 and two IBM 3081's under operating systems: MVS and VM/CMS. Ideal candidates for our current openings will be degreed and have 3-5 years of business programming experience.

In addition to moving expenses and present mortgage payment assistance, we're offering a top salary and benefit package. Please submit resume to:

HIRE from UPDATE/15

Experts point to other reasons for turnover. It is up to management to pay close attention to the needs and desires of the individual, noted Glenn Young, vice-president of Walter Ulrich, Inc., a Houston consulting firm. Management must provide the proper tools to do the job. "Without the right tools, people get frustrated and then leave," Young said.

Pratt & Whitney's Simonian added, "The major reason you lose people is that your objectives are no longer compatible. That can take many forms. A person may simply not want to live in the area any longer, or there might be a personal problem."

Lifestyle changes, Simonian pointed out, are among the leading culprits behind attrition with the predominantly young population in many DP shops. "As life objectives take shape, there is usually a logical reason for someone to leave," Simonian said. "And we are happy to mutually part ways in that situation."

Unfortunately, not every parting is so harmonious. Executive search firms have little trouble enticing potential candidates, especially mid- and upper level employees, to consider switching jobs. Top salaries are attention getters, but there is often underlying discontent for that employee which, if addressed, could have warded off the headhunter.

"My feeling is that people basically hate change, and many won't leave a job just for money," said Barbara Durant, assistant vice-president of wholesale banking support at Manufacturers Hanover Trust Co. in New York. "More people leave when they are unhappy. You can't stop headhunters, but you can work hard to keep people happy."

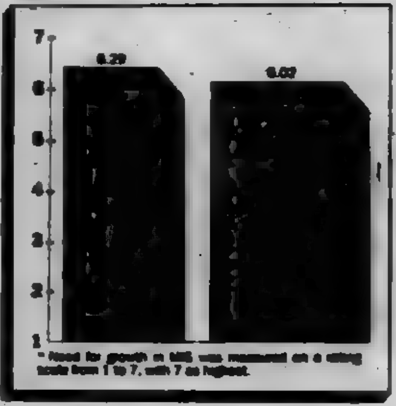
Core job descriptions

In 1978, Couger and his colleague at the University of Colorado, Robert J. Zawacki, released a major study on the motivation of analysts, programmers and operations personnel. The study extended the work of Frederick Herzberg, a pioneer in behavioral science in the workplace, to address the DP and MIS professions. Couger and Zawacki's research has continued since 1978 and has focused on several other key occupations within the profession, drawing on a data base of more than 10,000 DP and MIS employees.

Couger and Zawacki found that, not unlike the situation in any other occupation, the five core job dimensions are task significance — the impact of the work on others; skill variety — the degree of different talents required; autonomy — the freedom for the individual to determine job outcome; task identity — doing a job from beginning to end with a visible outcome; and feedback from the job. These factors, rather than salary, determined the contentedness and motivation of an employee.

The researchers discovered, however, that DP and MIS people had more acute needs in two particular areas than workers in other fields. The first area has been called growth needs strength and refers to the need for challenge and growth in a job. "Of the 500 occupations looked at previously, people in [the DP and MIS fields] have by far the highest need for growth in all job types," Couger stated.

The second area of note is called social needs strength and refers to interaction with fellow employees. "The need for social interaction is much less for people in our field," Couger said. "Many of the jobs in the field are the kind that can be done alone, and the profession has attracted people who work well alone."



* Need for growth in MIS was measured on a rating scale from 1 to 7, with 7 as highest.

By isolating these two characteristics, the study provides insight into some basic problems in retaining good DP people. "Most people need a sense of achievement, but it is more true in DP," Weiss explained. "It's [peculiar] to the breed. To grow professionally in this industry you have to learn new systems and keep abreast of rapid change. The DP person doesn't care what the environment is like — he'll work in the basement — but he wants continual challenge."

Providing a challenge for staff does not require bringing in the latest technological marvel, however. Fortune 500 companies generally don't have the inclination to purchase leading-edge toys simply to keep DP staff content. Instead, challenge and growth take other forms.

At Eastern Airlines' Miami headquarters, the computer center is responsible for a long list of dynamic areas of computing for the airline, including office automation, microcomputers, MIS and a host of applications development projects.

You could win $1000 in the first international computer-generated art contest

CW Communications, Inc. — the world's leading publisher of computer-related newspapers and magazines — is proud to announce its sponsorship of the very first international computer-generated art contest.

All entries must be computer-generated, mounted, and suitable for display. Entries will be judged primarily on their artistic merit, but execution will also be taken into account. Two prizes will be awarded. The winning individual will receive $1,000 (U.S.). The winning organization will receive a trophy.

Winners will be announced during the First Pan Pacific Computer Conference (in Melbourne, Australia, this September 10-13). All entries will be put on display in a special exhibit at this conference.

Enter today. Send your entry to:
The First Pan Pacific
Computer Art Competition
P.O. Box 212 (11 The Avenue)
Hampton, Victoria; Australia 3188.

Entries must be received by August 23rd

FIRST PAN PACIFIC COMPUTER CONFERENCE / CW COMMUNICATIONS

Management training can cut high rates of turnover

By Frank J. Stanley
Special to CW

Perhaps no individual within data processing has as much impact on the retention of good people as the DP manager. Ironically, the development of effective managers is usually ignored.

Missing from the managerial ranks of data processing are individuals who are suited to the role and individuals who are trained to carry out the role. In more cases than not, DP managers come from the ranks of the technical staff (programmers and analysts) and, at least initially, are little more than programmers and analysts with the title of manager.

While their understanding, acceptance and development in this role eventually occurs, it usually happens only through the efforts of that great teacher — experience. The unfortunate aspect of this type of management training, however, is the cost of the education. This cost in terms of stress, mental anguish, loss of personnel and actual dollars can be enormous and, as such, should be avoided if at all possible. While experience cannot and should not be avoided, better preparation of new managers to deal with those experiences will help to ensure better control of the outcomes and positive results. This can only be accomplished through effective management training.

Effective management training for data processing does not mean spending two days at a seminar nor does it consist of simply working alongside another manager for a week to learn the ropes. To be effective, training must consist of a series of educational encounters over a period of time that are specifically oriented toward the individual business and the skills that the manager must exercise.

An educational program has three purposes:

- It should assist in the selection of managers.
- It should provide for training in management skills.
- It should ensure continued reinforcement of those skills.

In addition, the program should provide feedback so that it can be self-correcting and continuously up to date.

The position of manager of systems or manager of programming is dramatically different from that of a systems analyst or programmer.

The differences are illustrated in the chart below, which lists various aspects of an individual's job as seen by a programmer/analyst as opposed to those same aspects as seen by a manager.

It is easy to see that major differences exist, and that many aspects of a manager's job are not necessarily skills that technical staff members have developed in the course of their careers. Perhaps the biggest and most difficult difference to overcome is that a manager is a facilitator not a doer. Managers are not measured by the output that they themselves produce but rather by the productive effort of the staff for which they are responsible.

[illegible]	[illegible]	[illegible]
Functions	Programming/ analysis, design	Planning, organizing, coordinating, controlling
[illegible]	[illegible]	[illegible]
Orientation	Specific tasks	Coordination of overall activity
[illegible]	[illegible]	[illegible]
Skills used	Technical/logical	Interpersonal — creative problem solving
[illegible]	[illegible]	[illegible]
Organizational commitment	Not required	Necessary
[illegible]	[illegible]	[illegible]

Typically, the first time a crisis arises, a new manager solves the problem by digging in and doing the work himself. In the short run this produces the necessary results, but over the long term it does not provide the manager with the opportunity to learn to manage nor does it encourage the growth, achievement and motivation necessary for a staff to be effective.

Working in a new area of responsibility can be uncomfortable when an individual is given new duties without adequate training. The helping hand and familiarity that training provides can mean the difference between avoiding and dreading new duties and eagerly undertaking them.

Stanley

Candidate selection is the first part of the training program and should be taken as seriously as the recruitment of employees. A management development program cannot be effective when applied to people without management potential. While there will always be a subjective aspect to this process, a certain degree of risk can be eliminated by developing selection criteria and a ranking method. The selection criteria should consist of qualities and attributes that are deemed important for the specific position within the specific organization and might include the following:

- Knowledge of the job. Does the person know his current job well, and is he aware of how it fits into the larger picture?
- Past performance. Has the person demonstrated qualities in his current position that indicate an ability to handle new duties?
- Desire. Does the individual want to be a manager? A person who accepts the position of manager but has no real desire for it will never become a really exceptional manager.
- Personality traits. Does the individual display the personality traits that are desirable in managers and tend to indicate potential success? These traits can be measured with a variety of psychological tests that are extremely accurate. The difficulty lies in determining which traits are important indicators of success.

A method of measuring developing skills that is used successfully in some firms is an internship program. This requires potential managers to spend part of their time in training and management activities while retaining their technical responsibilities. This gives the organization an opportunity to measure how well an individual is making the transition. It also allows the employee to determine his own feelings about the position and to back out gracefully if he does not feel that his career lies in the management area.

As more and more people pass through management training, the selection criteria can be refined based upon the success of those involved. A personality profile can be developed from successful managers that will help provide a better match for future candidates.

The training program

If a firm is going to invest in its future managers and hopes to provide valuable, useful education, then a lot of care must go into the selection, development and scheduling of training sessions. The needs of each organization will vary somewhat due to the nature of its business, but several rules and guidelines can be applied to most management development programs.

Business/administrative skills. A manager must know about the business that he is in; knowing Cobol, IMS and how to design systems may be a good background, but a manager's job extends beyond data processing and embraces the functions of the business.

It would be ludicrous to send an employee to an outside professional training session on performance evaluation or recruiting only to find that the policies advocated were at odds with the company's existing policies. Training sessions put on by in-house personnel are superior since they generally provide useful examples to which the potential manager can easily relate.

Interpersonal skills. There are a variety of managing skills essential to success that do not specifically relate to DP. These skills include the ability to communicate, listen, motivate, delegate, think creatively, solve problems and make decisions. In some respects, these are the most important managerial skills because these are people skills, and dealing with people is the essence of management. Because these skills are of general nature, training can be provided either in-house, if expertise exists, or at professional seminars. Outside training for these types of skills can be beneficial as valuable insights and fresh approaches can be learned.

Continue to reinforce. Education should not stop once a formal training course is completed. Rather than following a rigid curriculum, a trained manager should spend a certain amount of time advancing his management education.

Practice. No one should be expected to attend a comprehensive management course and then be able to perform effectively; much of what is presented in a lengthy course gets lost in the sheer volume of material. An effective format for training consists of a series of training sessions, each oriented toward a specific skill spread out over a period of time. Sessions should be intensive, interactive and include examples and role playing.

Technical training. To manage a DP staff effectively and to play a part in making crucial decisions, a manager must maintain some degree of proficiency in the technical areas. This usually is not a problem when someone is initially promoted, as they are likely coming from the technical ranks where their skills are sharp. But as time goes by and the hardware and software environment changes, a manager may find himself getting technically out of date.

A successful management training program is hard work. The results, however, are worth the effort. By ensuring that the correct people are selected and that they are aware of their roles and prepared for them, an organization is ensuring the success of both its managers and all the individuals who work for them. ■

Stanley is systems engineering manager for the Computer Task Group, Inc., a management consulting firm in Independence, Ohio.

Update

HIRE

from UPDATE/16

Addressing these issues, according to Eastern's Rodrigues, is what provides the challenge. "If you try to keep up with the latest technology today, you won't get any work done," he said. "We try to give people the opportunity to move internally. Say an applications programmer has his sights set on being a technical programmer; we try to be flexible in transferring people to keep them happy in what they are doing."

Cross-training in various technical disciplines can help avoid task or applications specialization in which an employee gets pigeonholed. Calling on a particular employee to repeat the same task continuously not only can lead to boredom but also can limit that person's scope of knowledge. As Stanley stated, "Cross-application work not only provides employees with fresh areas of interest but also provides valuable cross-training to safeguard the organization."

Corporate planners and managers are also discovering a more obvious route: get DP more involved in the business of the organization. DP and MIS personnel have long felt that their group was simply an add-on service wing of the business that could just as well provide its function to company A as to company B.

"It's up to the companies to work hard to make DP [employees a] part of the business and not just hired hands with a technical specialty," said Randy Nord, vice-president of Kurt Salman & Associates, a Princeton, N.J., consulting firm.

At Pratt & Whitney, a continuing effort is being made to do just that. According to Simonian, "We are here to produce high-quality, low-cost [airplane] engines on time. That is our product." The MIS group is as much a part of that enterprise as anyone is, he said, and its activities are measured in terms of how well it impacts on the company's product.

"It's amazing that people think they have to create phony leading-edge projects so they can fool around with the technology," Simonian said. "We don't do that here. We are dealing with applied technology, but it is in a real environment. It's incredible how much more stimulation comes from that than from a contrived situation."

Low social needs

The second characteristic that emerged from the Couger/Zawacki study — low social needs among DP and MIS professionals — has had an equally strong impact on retaining good people. As end-user computing spreads, the DP professional's role has changed, and the need for interactive grace has become acute. In addition, lack of good communication skills has become somewhat inbred in DP environments and has been the source of many attrition problems.

'The major reason you lose people is that your objectives are no longer compatible. That can take many forms.'
— Arthur Simonian
Pratt & Whitney Aircraft Group

As Couger pointed out, managers and supervisors who came up through the ranks continue to have the same lone-wolf mentality as they did when they were programmers and analysts. Thus, they are less likely to spend time with their employees providing guidance and feedback, and, in turn, the employees are not inclined to knock on a supervisor's door to ask for it.

These same employees, however, with high growth needs strength, are goal-oriented and want very much to know about their progress. These conflicting needs and the resulting lack of communication between employee and manager lead to frustration and, often, resignation.

As Stanley noted, "recognition of effort makes employees feel that their work is important and worthwhile. *An employee will never mistake lack of criticism for recognition.*"

Recognition comes in many forms. A simple pat on the back or announcement of a job well done at a staff meeting — both just common-sense practices for enlightened managers — can work wonders. "Little things mean a whole lot," Nord said. "It's important to recognize what DP is contributing to the business."

At Eastern Airlines, employees who do outstanding work are given free passes for flights. Cash bonuses, if available, are excellent motivators but have the drawback of instilling jealousy and discontent among co-workers.

Involving employees in joint planning for the organization instills a stronger commitment on the part of the employee to make those plans work. Giving employees more responsibility, stretching their capabilities and saying, "I know you can do it," provides extremely positive feed-

Beautiful. Technology.

That's what we offer at Bear Creek Corporation in Southern Oregon. You'll work with advanced applications technology in beautiful surroundings, away from big city congestion.

We're a growing, quality-oriented company which markets fine mail order products (fresh-fruit, gourmet-food gifts, roses and garden products) directly to the consumer through two principal subsidiaries, Harry and David, and Jackson & Perkins Co. We're located in Medford, Oregon, a town which is still small enough that the trees outnumber the people in an area offering excellent skiing, hiking, fishing, sailing and swimming.

Currently, we're looking for:

PROGRAMMER ANALYSTS

You'll design and program computer systems and will be involved with gathering specifications, coding, testing and installing systems to user's satisfaction. 2 years' experience programming IBM 360/370 computers in ALC and working with IBM MVS operating system, JCL and utilities is required. You must also have excellent communication skills.

CICS SYSTEMS PROGRAMMER

You'll provide technical software support to applications programmers, users and operations and will evaluate new software. 3 years' experience with CICS assembler language programming, CICS data communications and excellent communication skills are required. IMS, DATACOMM or other DBMS experience desired.

TECHNICAL WRITER

You'll write and edit various applications documentation and other supporting materials for user, operators and programmers. 2 years' experience in technical writing specifically for large mainframe computer systems required. Other requirements include experience with popular IBM PC word processing software and excellent communication skills.

SYSTEMS ANALYST

Your primary duty will be translating user requirements into specifications for computer-based information systems. You must have two years' experience in systems analysis in a large organization using mainframe computers. Excellent communication skills are also required. A programming background would be helpful.

MANUFACTURING PROGRAMMER ANALYSTS

Responsibilities include programming and maintaining computer systems for manufacturing. To qualify, you must have knowledge of concepts associated with materials requirements planning, inventory accounting, work-in-process, purchasing, accounts payable and quality control systems. A proficiency in structured IBM/AMS COBOL is also required.

Bear Creek Corporation, a subsidiary of R.J. Reynolds, offers competitive salaries, excellent benefits and fully-paid relocation assistance. Please send your resume with cover letter and salary requirements to: VP Human Resources, P.O. Box 299, Medford, OR 97501. EOE.

BEAR CREEK CORPORATION

Reach over 30,000 Australian computer professionals.

Advertise in CW Communications' Australian publications and sell your products directly to Australia's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are more than 2,300 mainframe computer systems installed in Australia and more than 333,000 computers of all types. CW Communications covers the Australian market with five important publications.

10,000 MIS/DP executives read *Computerworld Australia* each week. *Computerworld Australia* covers new products and services, current applications and industry trends. *Computerworld Australia* subscribers will also receive *On Communications*, a quarterly publication for communications professionals which helps readers plan their communications strategies. And, on the third Friday of each month, an additional 12,000 readers receive *Australian Microcomputerworld*, a supplement with in-depth information on the microcomputer industry.

Twice each month, 12,000 IBM PC owners and potential buyers turn to *Australian PC World* for timely information about IBM PCs and compatibles.

Australian Macworld is the only magazine in Australia for the Macintosh user community. This bi-monthly publication reaches over 12,000 owners and potential owners of the Macintosh.

CW International Marketing Services makes advertising your products in Australia, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

The local area network for companies with bigger things in mind.

How far do your communications needs take you?

The next building? The next city? The next continent?

With Codex, the answer is anywhere you want.

The Codex LAN offers you unmatched flexibility and efficiency.

It lets PC's not only share information, but expensive resources such as printers and disks.

It allows you to include minicomputers and mainframes from many vendors in your network, so everyone can share resources.

You can even tie one local area network in Boise to another local area network in Bangkok. Or Boston. Or both.

The Codex LAN is a complete systems solution. With software that allows sharing of peripherals. Capabilities for both baseband and broadband communications. Plus all the internetworking gateways you need to tie your LAN to other networks in your organization—whether it's our network or someone else's.

Then there's the advantage of Codex experience. For the past twenty-three years we've literally written the book on networking, statistical multiplexing, adaptive routing, protocol intervention, you name it.

If you're beginning to get the feeling that there's no end to what a Codex network can do for you, you're absolutely right. Our communications experts will work with you in mapping out a strategy that'll satisfy your needs today, and for years to come.

For more information about Codex's forward thinking networking solutions, write Codex Corporation, Dept. 707-261, 20 Cabot Boulevard, Mansfield, MA 02048. Or call **1-800-426-1212, ext. 261.**

High-Potential Opportunities For MIS Professionals

... At COLECO Corporate Headquarters In The Heart Of New England

For over 50 years, COLECO has balanced business know-how and creativity to lead the way in new entertainment products for home and family. If you are an experienced MIS professional able to advance the aggressive growth strategies that will mark our second half-century, we would like you to consider the following immediate opportunities at our corporate headquarters in West Hartford, Connecticut.

STATE-OF-THE-ART HONEYWELL ENVIRONMENT

SYSTEMS ANALYST/DISTRIBUTION SYSTEMS... Interface with users to develop a worldwide distribution system in an on-line interactive environment – and plan future corporate systems needs in this area. Requires at least 5 years in project planning and in-depth knowledge of on-line interactive distribution or sales order processing systems. BSCS or equivalent required.

SYSTEMS ANALYST/FINANCIAL SYSTEMS... Design and implement on-line interactive financial systems. Requires 3-5 years financial systems design experience in an on-line interactive environment, preferably in a manufacturing organization. BSCS or equivalent required.

Coleco offers a competitive compensation and benefits package. If you're ready for professional challenge and rewards second to none, please forward your resume, indicating position of interest and salary requirements, in confidence, to: Joyce [illegible], Senior Recruiter.

from UPDATE/18

back and recognition of talent.

"If management creates an expectation of success for an employee, it is a very powerful tool," Weiss said.

For DP and MIS employees, another major frustration is lack of communication. Couger's study, in fact, indicated a universal feeling among DP professionals that their supervisors are poor in providing feedback on performance. The supervisors, in turn, were unaware that their staffs felt that way. "People love to be informed," Durant said. At United Technologies Corp., of which Pratt & Whitney is a part, all middle- and upper level managers are required to take specialized training programs for strengthening communication skills.

"People today want to be communicated with," Pratt & Whitney's Simonian said. "Even with our training, it is still a large problem. It's not adequate to give people a directive and leave. The two-way communication trail is the largest single obstacle we constantly fight to overcome."

To that end, the company has specific policies regarding supervisory ratios (they are kept as low as possible) and the amount of interaction required between supervisors and employees. Managers are encouraged to meet regularly in small groups to discuss needs and frustrations, and there are formal appraisal programs for feedback on performance and status. "We work at it very hard, but it needs constant attention," Simonian said. "It's like growing grass — the minute you turn your back, you've got weeds."

> 'If management creates an expectation of success for an employee, it is a very powerful tool.'
>
> — *Madeline Weiss consultant*

For managers of MIS and DP, the pressure to understand the needs of employees and to communicate that understanding is greater than ever. "People change and the manager must be a good diagnostician to understand those changes," Weiss said. "Dollars may be critical to someone at [age] 23 but won't mean the same at 35. The manager has to see what really turns on that person. The bottom line is there is a strong need to be respected."

Training, the Computer Task Group's Stanley noted, is usually given a great deal of lip service but actually given low priority in most organizations (see story Update/17). For the DP and MIS environment, training in behavioral techniques and management issues must, in fact, become a high priority as that environment continues to change. Taking a technical person and reorienting him to the realities of the modern business world is a difficult task. But the companies seeing the greatest progress in retaining good computer professionals are the ones that have addressed these issues. "In shortsighted organizations, interpersonal training doesn't happen," Weiss said. "It's always on the back burner."

Management must also be cognizant of which people are interested in expanding their interpersonal skills and which people aren't. It should be clear, Weiss noted, if a systems programmer simply doesn't want to get involved with end users. Those people, she stated, should not be pushed into it. For others who want to expand their horizons, the company should provide the training.

These changes, of course, do not come easily. Weiss suggested training in the form of workshops and outside consultants. The use of role-playing, for example, often provides good results. Weiss recalled a mid-level manager who was having problems at home with his child. In the workshop, he took on the role of a systems analyst and came across as gruff and menacing. Unlike in his work and home environments, he saw clearly what was amiss. "These changes don't often come naturally," Weiss said. "People have to adapt."

Weiss

Acquiring these skills will pay off not only for the DP or MIS employee in his current position but will also provide a solid foundation for the step up into management. Unfortunately, up to now that route has been littered with casualties. As Walter Ulrich's Young said, the attempt to turn a techie into a manager is where the "Peter Principle [the theory that eventually a good worker will rise to his level of incompetence] really shines through. Taking a good technician and turning him into a bad manager really hurts at both ends."

Dual career tracks

Unfortunately, the time-honored business practice of rewarding outstanding employees with promotion into management has been particularly damaging in DP and MIS. Companies have recently begun to examine the possibilities of dual career tracks for technical employees. Though many have looked into it, few have implemented the plan. One that has, with success, is Eastern Airlines.

Eastern, according to Rodriguez and Labay, had suffered serious turnover problems with DP and MIS during the past several years as deregulation rocked the airline industry. DP employees at Eastern, fearing for their jobs, left in droves.

Having survived the storm, Eastern has recently turned its business problems around, and stability is beginning to return. With it has come an aggressive reshaping of many corporate policies; among them was the institution of a professional grading structure for DP employees. This track takes programming and technical people out of the main management salary structure and creates an alternative in which competent technical people can be promoted and given pay increases without becoming managers.

Rodriguez, left, and Labay

"Your used to get up to the top of the technical level and there was only one way to go — into management," Rodriguez said. "If you had a fantastic technical individual, the only way to go up was to become a project leader or manager. Now that person can go just as high on the professional side."

According to Labay, this innovation has attracted quality staff back to Eastern. "We now have the salaries to entice people, and the professional salary structure gives advancement potential to those who don't want to be managers."

For those who do express interest in management, it is essential that their progress be carefully mapped out and monitored. Couger and Zawacki, in one of their studies, monitored the project leader position and discovered that there was a high level of dissatisfaction among these people. The cause, they found, was that young, first-time managers could not handle the pressure of reporting to two people — their own technical manager and the manager for the specific project.

"One [manager] rates them on their on-the-job performance and the other [manager] actually gives salary increases," Couger explained. "If you put a first-time manager in that situation, it creates a very awkward and difficult situation. It ought to be the second job in management."

Among the many technical occupations within DP and MIS, the one most prone to unhappiness and turnover is the systems maintenance person. Unlike applications and technical development, which are considered the leading-edge, glamour positions, maintenance has earned a reputation as a second-class, less-challenging job. Indeed, in Stanley's report on motivating DP personnel, he cautions against letting maintenance programming become someone's sole job function.

In a recent study of maintenance personnel, Couger found that managers were looking for ways to enhance maintenance tasks. "One company changed the name from maintenance to retrofit engineering," he laughed. "They figured if they changed the name, people would be more interested. That lasted about five minutes."

The interest in the field is motivated by economics, he said. Maintenance makes up 50% of the typical DP budget and is forecast to be 60% within five years.

Durant, in charge of maintenance programming at Manufacturers Hanover Trust, has taken effective steps to keep her people happy. She acknowledged that it is more of a challenge to keep maintenance people motivated, but she has had great success in this area by following some basic rules.

Durant keeps her staff of 45 productive and motivated "with a lot of TLC." She makes sure that she knows everyone by name, takes people to lunch, organizes after-hours activities and generally "fights for technology." Durant also encourages people to write letters of thanks for her staff's efforts and pushes management to recognize the quality work that is being done.

"My job is sales," Durant stated. "I have to generate work for my people. I do that by building a reputation for high standards, which attracts good people." Durant also pays close attention to the needs of her employees. She has the flexibility, she noted, to move people from one project to another if she senses they are getting bored. She also keeps an eye out for new technology and fights to remain state of the art.

"I have incredible respect for what my people do," she said. "It's a real challenge going into other people's code and figuring out what is happening with little or no documentation. There's incredible pressure to respond."

Ironically, Durant finds that some people get into maintenance because it provides a smoother path into management, unlike in development, where there tend to be many high-level people. She has also helped establish other career paths for those who eschew leadership and want to remain on the technical side of things.

Despite the innovative techniques companies have initiated, finding and keeping the DP and MIS staff continues to cause concern in corporate America. Companies facing increasing labor costs in all occupations have instituted flexible hours, increased benefits packages, telecommuting policies and many other innovative options to keep their staffs happy and intact.

For DP employees, the difficulties are even greater. Computer professionals continue to hold a social reference point for equity and fairness outside of the company. They are less interested in comparing salaries with, say, those of accountants within the company than with fellow DP professionals in other companies. This makes it difficult for managers to make sure their policies appear fair and equitable to the DP and MIS departments.

When supply reaches demand in the field, things will get better, Nord predicted. "It's still a relatively new profession, and there are a lot of people working in it who are not all that good," he explained. "And we haven't learned all we need to know about training and developing a good staff. It'll be a long time before supply reaches demand, and there's a way to go before it all settles down."

In the meantime, enlightened leadership can clearly make a difference. "If you keep talking to your people, you'll know when they are getting unhappy," Durant concluded. "Nothing replaces good management." ■

BUILDING A COMPUTER CENTER?

If you're planning a new, expanded or remodeled DP facility, you need Datasphere's help.

Since 1968 Datasphere's unique combination of services has saved dollars, frustration and time for large and small firms around the world.

From turnkey—design/build computer rooms to consultation on the smallest project, we'll do all or part—on schedule, within budget! Datasphere is unique—we're engineers, consultants, planners and builders specializing in computer facilities.

Datasphere's engineers are expert in all computer support systems including:

- *Uninterruptible Power Systems*
- *Computer Power Centers*
- *Computer Fire Protection Systems*
- *Computer Type Air Conditioning*
- *Gas Turbines/Diesel Generators*
- *Operation Command Centers*
- *Elevated Flooring*
- *Frequency Converters*
- *Line Filters*
- *Security Systems*
- *Systems Monitors*
- *Voltage Regulators*

LEAVE

from UPDATE/20

stall and operate a system of employee development that can be managed so that the majority of the higher level job openings are filled by promotion from within. This can be accomplished through a series of promotions that will ultimately lead to new people being brought in at the lower levels of the department.

The method is to develop what might be termed a pipeline process. This entails a continuous employee development effort at all levels of the department. Under this process, people are encouraged to prepare themselves for higher level jobs, either in their section or in another section. These people are given first consideration for positions as they open up.

The pipeline concept requires that as people reach the higher levels of the department, they must make career decisions. The further up in the organization one moves, the less available become opportunities to continue advancing. As people reach higher levels, they must either accept and make peace with the fact that their future advancement opportunities are limited or move on to something else.

Making peace does not mean that these employees should go into semiretirement while still employed. It means they should be willing to accept and adjust to the reality that as one moves up the organizational ladder, opportunities to continue to advance become increasingly scarce. Even though further upward movement may be blocked, given the appropriate environment, it will still be possible for people to find new challenges and develop new skills.

This can be accomplished through lateral movement to a different area within the department. Opportunities outside the DP/MIS department, which offer new challenges if not advancement, may also be available.

Disgruntled employees who stay on board but are unable to make peace with limited prospects for advancement, tend to have a deleterious effect on everyone. In such circumstances, employees who at one time were productive and dedicated can become a detriment. Once people become unhappy with the organization, for whatever reason, it is in the best interest of everyone if they find employment elsewhere. Again, some turnover is welcome.

Some people, aware that they probably have reached the highest level they can within the organization, will choose to leave. This should be viewed, provided appropriate employee development work is in process, as a positive circumstance for everyone concerned.

> **Once people become unhappy with the organization, for whatever reason, it is in the best interest of everyone if they find employment elsewhere.**

The particular employee will have obtained a variety of skills and knowledge. The organization will have obtained the services of a very good employee. If the process is handled correctly, the parting should be amicable and should work to enhance the reputation of the organization.

Those who remain will also benefit. If the development strategy is correctly built, several promotions can be effected as a result of the departure of one senior-level person. The promotion of someone from within the department to this position from the next lower level can develop a cascade effect where a number of promotions can be realized within the department.

Clearly, the building of a pipeline development process requires strong departmental management commitment. ■

IBM SYSTEMS SOFTWARE PROFESSIONALS

25 Years, 9,000 Clients And 20,000 Products Later... ADR Is Still The Logical Choice.

For 25 years ADR has been the logical choice for the serious software professional because ADR systems software represents the only completely integrated solution to even the most complex user requirements. ADR's systems software has another unique characteristic—it is designed to accommodate change.

Developing this software is very demanding work. It requires a solid technical orientation, a good measure of creativity, and the ability to anticipate the course that technology is likely to take through the next decade.

If you're intrigued by the idea of working in one of the world's most sophisticated software development environments...with some of the industry's leading software development professionals...you should consider a career with ADR.

Currently, we have positions available in Princeton, NJ and Dallas, TX for IBM technical professionals experienced in any of the following areas:

Systems Software Development

- 4th Generation Languages
- Data Base Management Systems
- Word Processing / Electronic Mail
- Performance Measurement / Capacity Planning
- PC/Mainframe Communications
- Operating System Extensions

Technical Support Services

- Data Base Administrators and Consultants
- MVS / DOS / VM Technical Support
- Systems Programmers (MVS / VTAM / NCP)
- Systems Analysts / Programmers (DB / DC)
- Human Factors

At ADR the serious technical professional will discover an environment uniquely conducive to both professional and personal growth. Through the use of in-house training seminars and our liberal education assistance program, you will be encouraged to make full use of both your technical and administrative / management skills. ADR offers a salary fully commensurate with your experience and a benefits package which includes prescription drug, dental, and retirement plans. Additionally, ADR offers liberal relocation assistance to qualified professionals. For consideration forward your resume or call: Gary Johnson, (201) 874-9000, APPLIED DATA RESEARCH, INC., Route 206 & Orchard Road, CN-8, Princeton, NJ 08540. An Equal Opportunity Employer.

ADR
APPLIED DATA RESEARCH

We keep writing the history of software.

WOMEN from UPDATE/11

This DP director felt especially battered because she had left a major Fortune 500 company after 14 years (during which time she had earned a master's in business administration) and took a DP planning job with a media/entertainment company. After nine months, that company went on the skids, and she was laid off with six months severance pay, few professional contacts and little sense of how to go about looking for another job.

Executive recruiters did not offer much solace. She wanted to stay in New York but didn't have the financial services background recruiters were all looking for.

"I'd look at the interviewer's face. His jaw would just drop open when I told him what I'd been making," she recalled. She also remembered the pain of hearing that a man 10 years younger got the job in question at almost the salary she was asking. "I think there are a lot of doors closed to women. I experienced a lot of discrimination while looking," she said about her job search.

Up against the wall

The problem is not the $50,000 or $60,000 wall, countered Chick Bisberg, a senior consultant with Halbrecht & Co., which specializes in placing systems professionals. "Feeling they're at a wall at $50,000 or $60,000 is the direct result of a lack of previous career planning," Bisberg said about DP professionals who feel trapped. "They're overpriced, making no technical contribution." They might also have "topped out" their careers, he said.

DP professionals aiming for annual salaries of $60,000 and above must buttress their backgrounds, Bisberg said. If they have a computer science degree, add a master's degree in business administration; if their background is in business, pursue technical expertise, he said. Personal computers have been a good technical entry point, but those opportunities are already drying up.

There is little bright news for women or men who have topped out. "It's a rude awakening," Bisberg said. To move on often requires major sacrifices in dollars and geography and retraining and rethinking of career directions.

> **In today's favorable DP economy, if a man and a woman are vying for the same job and the woman has stronger experience and commands a higher salary, the employer will hire the woman.**
>
> *— Chick Bisberg*
> *Halbrecht & Co.*

Overall, in today's favorable DP economy — at least from a recruiting standpoint — Bisberg finds that if a man and a woman are vying for the same job and the woman has stronger experience and commands a higher salary, the employer will hire the woman.

Likewise, "while more women today are getting promotions, fewer women are being promoted simply because they're women," he observed.

In fact, many women have found favorable niches for themselves in DP-related fields, according to research by Cognos Associates, a non-profit research group in Los Altos, Calif., which studies women in the electronics industry. "Women whom we talk to express a high degree of satisfaction working in electronics — higher than in other industries," reported Judith K. Larsen, coauthor of *Silicon Valley Fever* and a social researcher on the impact of technology.

Good news, bad news

"Electronics is still expanding so rapidly, there are more job opportunities," Larsen explained.

The bad news, however, continues to be salary. Studies have shown that women continue to earn less money than men who are in comparable DP positions.

The good news is that opportunities for women continue to improve, especially for women breaking into the new, hot technologies such as telecommunications, artificial intelligence or fourth-generation programming languages. Entry-level professionals must position themselves now for these areas of expertise, Bisberg said.

Four years ago, the hot technology was personal computing, and Margaret Levine, who received her computer science degree from Yale University, found herself less interested in how the computer worked and more interested in what people were doing with machines.

After joining the MIS department at Columbia Pictures in New York, Levine was put in charge of purchasing personal computers. Though she has since left Columbia, she contends that working with micros opens opportunities to women, especially as personal computer applications and word processing, a traditionally female field, come together. ■

SoftFair Unveils SoftView

Software Career Link (SCL), sponsors of SoftFair, the highly successful series of nationwide job fairs for software and data processing professionals, has introduced a new, resume matching service called SoftView.

Drawing on a computerized database of thousands of experienced software professionals, SoftView can match a participating company's hiring specifications with a potentially unlimited number of qualified applicants, thus giving the company a vital "view" of the current software job market. And, with the data base growing by 2000-5000 applicants from across the country each month, SoftView will soon be able to provide an ongoing flow of appropriate resumes to participating companies in several cities throughout the U.S.

"SoftView is a very easy, effective, and inexpensive means of sourcing." - Vincent

The service has been in development and testing for the last several months, with only a handful of local client companies participating. Now that all development work has been completed, SCL director Paul Vincent expects SoftView to generate a great deal of interest among companies and applicants alike.

"SoftView is a very easy, effective, and inexpensive means of sourcing," Vincent said. "For a modest annual subscription fee of $9,000, a company can receive hundreds of resumes over the course of the year which match its hiring requirements. And, with our guarantee of a minimum of six hires during the year, that means an incredibly low cost per hire of $1500.

LOW COST HIRING

In fact, a company can hire as many as 12 through the service at no additional cost, thus further reducing the cost per hire to $750. Client companies are protected through SoftView's exclusive money back guarantee. At present, companies who subscribe to SoftView also receive free attendance at a SoftFair in the city of their choice.

"For an applicant," Vincent added, "SoftView is even simpler. All he or she has to do is submit a resume and, assuming it indicates software or data processing experience, his or her credentials will then be entered into our database and subsequently matched with our client companies -- in complete confidence, of course. We have a built-in screening device that protects an employee's job search from being known by his or her present employer."

Thus at no cost and no risk, a qualified applicant can be assured that his or her resume will be matched appropriately with participating SoftView companies, gaining exposure and attention that blind resume forwarding just doesn't provide. And, if a candidate is looking to relocate, SoftView can match a resume with appropriate companies in various cities across the country. In short, if you're an experienced software professional and place your resume with SoftView, you can be certain that it will be seen by client companies looking for your credentials.

Software Career Link's motto is "Linking Software Professionals with Software Careers" and, with SoftFair, the company has done just that, demonstrating a practical side to its philosophical commitment to low-cost, effective sourcing and recruiting for the software industry. With SoftView, SCL has broadened that commitment and is certainly on its way to proving that it is indeed "Changing the Way America Hires."

HUNT from UPDATE/5

ers and employment agencies. These people, Gaines said, tend to be guarded and distrustful and won't return phone calls.

Among the current hot disciplines are telecommunications, network management, product development and systems software.

"It's hard to find people who can balance technical issues with management abilities," Gaines said. "That's our biggest problem. Almost all our searches are geared not to technicians but to those who can initiate and carry out the goals of the business. But we can't have someone with just management skill; they must have the technical skills as well."

The searches tend to be national in scope and focus on major urban areas where the best and the brightest are usually entrenched. Gaines finds it difficult to entice people from vendor organizations into user jobs. "Users are not as associated with innovation and new products," he explained. "But then again, innovation and drive don't necessarily lead to good management skills."

The key factor in tapping a candidate, Gaines pointed out, is whether that person is looking for a job or the search firm is creating the impetus for a move. "When we reach a person who is not looking, we need to create the motivation for switching," he said. Though salary is important, the determining factors lie elsewhere. A bigger, more important job with less constraints of corporate bureaucracy and an environment more attuned to innovation are major selling points.

"We don't want salary to be the prime motivator, although the opportunity for substantial increase may be there," Gaines said.

Gaines also avoids job-hoppers and 20-year veterans, feeling that extremes at either end are negative attributes.

Once he has found his candidates, Gaines begins the lengthy process of assessment and invites them in for interviews. "I try to determine the true quality level; how strong are they really?" he said. "How are their leadership and management skills? What are their goals? Are those goals compatible with the goals of the company? Is their style synergistic with the company, or will they create conflict? What is the depth and breadth of their knowledge?"

Gaines keeps in constant contact with the client company, giving progress reports and arranging follow-up interviews. Once he has sent the candidate to the client, Gaines does not step out of the process.

"We try to bring closeness to the match," Gaines explained about his recruits. "In more than 90% of the cases, the people we provide thrive in their new jobs. They establish long-term relationships." ■

IN DEPTH

Executive Interview

Al Smith
Atlantic Richfield

CW PHOTO BY GEORGE HARRAR

By George Harrar
Features Director

Al Smith is the manager of Corporate Units Information Services, the systems provider to Atlantic Richfield Co.'s headquarters in downtown Los Angeles.

Arco's annual revenues declined only slightly in 1984 to $24.6 billion. But net income plunged from $1.5 billion to $567 million, mainly because of excess crude oil and refining capacity worldwide. The nation's sixth largest oil company is retrenching by divesting unrelated businesses. The massive restructuring will take two years.

Pushing office automation isn't easy anywhere these days, but it's particularly tough in a company with its mind on oil. That's Al Smith's job. He was interviewed in his 21st-floor office in the "Arco building."

What is the priority of office automation in a giant oil company such as yours?

It's mixed. Obviously, when you have different operating companies, there are different priorities. We in corporate started as early as 1979 to begin to look at office automation and personal computers — we actually bought our first personal computer in 1978 or 1979.

From which company?

It was an Apple, as a matter of fact, just to see what it could do. We put Ethernet on this floor in 1980, and now we have expanded it to several other floors. So we've been working with Xerox Stars and some 860s. Now we've added personal computers to the network.

Which personal computers?

IBM.

They work on Ethernet?

Yes, there's a new board and a new system and we've been testing it for several months. Now it's up and running. We haven't done a lot of integration with it, but we're starting to use the services available on the network.

Getting IBM Personal Computers to work on Ethernet is a challenge.

It has worked, but as I say, we haven't tried to do every little service that you can do. It seems to function.

Are these ATs or XTs?

XTs, basically. We haven't tried to put the AT on Ethernet. We think it will work. I think there are several ways we could do that. But we don't have a lot of ATs yet, anyway.

What services are available through Ethernet?

We can do messaging from the different floors and some mail services. We can transfer documents — we do a lot of that.

> **"I believed early on that we're going to work a lot differently as we put more workstations on people's desks."**

IN DEPTH/INTERVIEW: AL SMITH

PROFILE

ATLANTIC RICHFIELD

Corporate headquarters - Los Angeles
Annual revenue(1984) - $24.6 billion
Number of employees - 39,000
Main business - Petroleum refining
Mainframes - IBM 3030 and 3080 series

How many floors are linked by Ethernet?

Arco occupies about 30 of the 50 floors in the tower here. Four or five floors are wired up. We communicate data back and forth between our employee relations people and my staff.

Will you expand to more floors?

As the need arises. One of the reasons we did this was to learn about local-area networks and the impact of office automation. It was our belief early on — my belief, anyway — that we're going to work a lot differently as we put more workstations of one kind or another on people's desks. We've learned a lot from the pilots we've done.

What have you learned?

One is that relationships change between people. For example, just in our case on this floor, the secretary is no longer the font of all knowledge. Documents get prepared without the secretary even seeing them in many cases, including multiple distribution. A lot of our people are now beginning to use these things in lieu of yellow pads. They just don't write anymore. They're creating on the terminals. We've seen a lot of synergy and creativity; we're seeing things done much more effectively.

One of the things we noticed in our employee relations pilot was that the decision cycles come down radically. An employee relations manager would, in years past, ask for some statistical data in graphics form; it would take several weeks to gather the data and pull it all together. Now, basically, with various spreadsheets and graphics packages, they can pull this together in two, three or four hours quite often, and that becomes the accepted norm. Now if it takes longer, that causes an issue. The cycle that people plan to produce documents, the way in which they expect things to happen, becomes compacted.

Some of the benefits of office automation that you mention are intangible.

No question about it.

How do you prove your case financially?

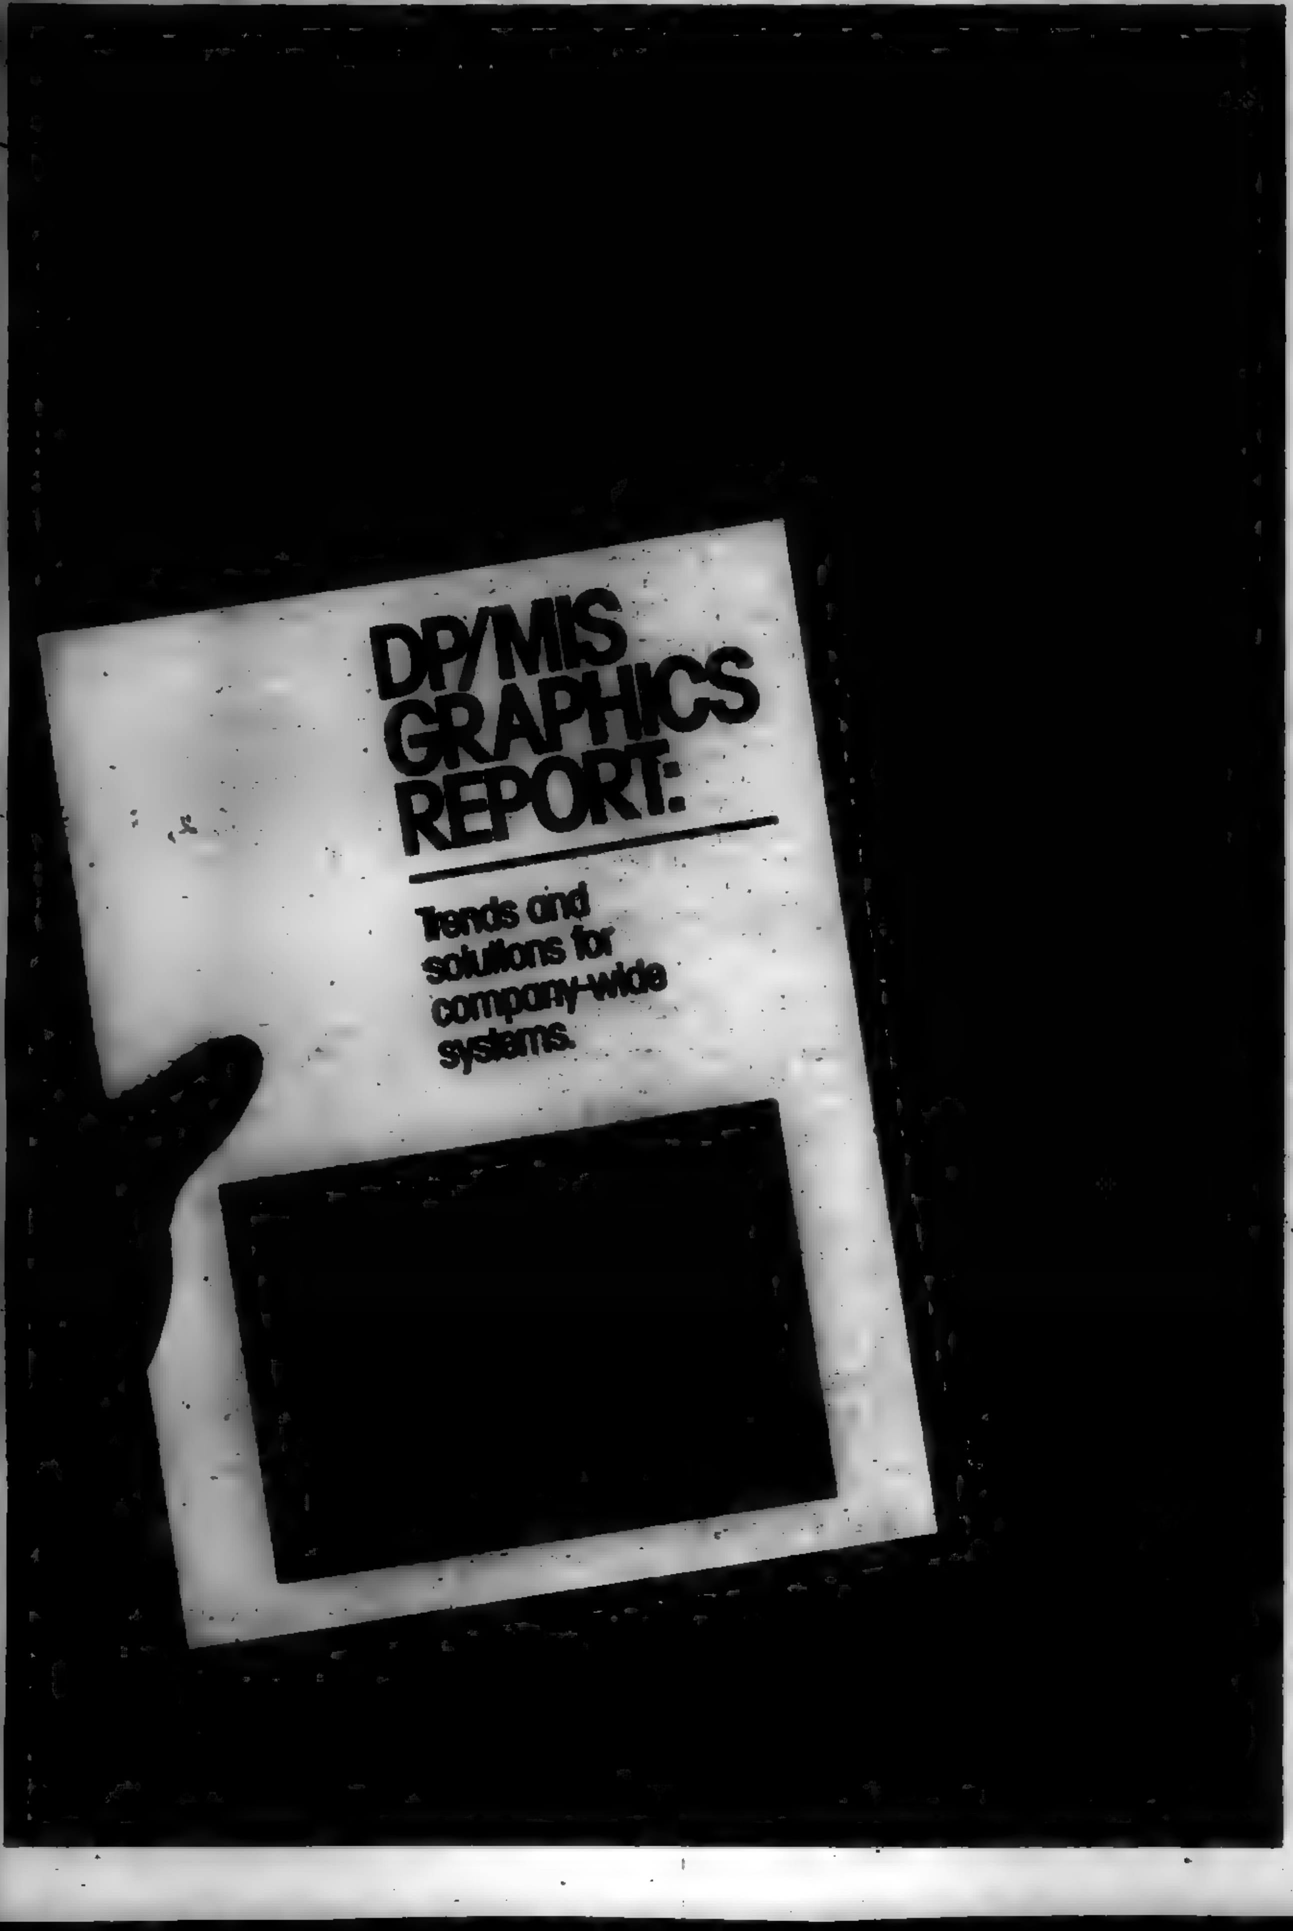
With great difficulty. We have had several office automation pilots that clearly demonstrated return on investment — a very large return in the 30% range — where we've been able to calculate the before-and-after costs of running the function and demonstrate that it paid. We have had some other projects where there are clearly intangibles. We can't extrapolate from one to the other and say, therefore, that everyone will save X amount of money.

Tell me about a pilot project that failed.

Let me think about that. We had one years back where we put in some equipment — I'd really rather not get specific about equipment, because it sounds like I'm panning someone, and I'm not. We put it in, and it really didn't do what we wanted it to do. We learned a lot about how people receive things — it was basically a clerical and secretarial pilot, a predecessor to the Xerox Ethernet. We learned a lot about what we did want because of what we couldn't get with this.

Ethernet and Xerox don't have the strongest reputation in office automation. What has been your experience with the two, the company and the network?

I think we have done good things with their products. They have worked hard to support us. We think they



are beginning, maybe, to improve on what they can do with the network, and we're pleased with that. There are many things we've wanted that we haven't been able to get. That's partly because Xerox has been restructuring, and there have been a lot of changes. From a service and support standpoint, it has been acceptable.

In retrospect . . .

Oh, I still think it was an excellent decision, absolutely. I have no doubts about that. There aren't many games in town, from a local-area network standpoint. When the [Xerox] Star existed in 1979 and 1980, there just wasn't anything else on the marketplace like it. It is tremendously powerful and easy to use. We went into it with the idea that we would learn a lot.

We're not trying to proliferate it everywhere, though our ultimate goal is that probably by the end of the decade maybe 75% to 80% of our people will have a workstation on their desks. In one form or another, we're probably at about 40% or 45% already.

If power and ease of use are the benefits of the Star, what are the drawbacks you have identified?

The Star is not quite as fast as it should be — everyone knows that. For some people, it's just more machine than anybody needs. There are so many things you can do with it, some people just don't need that much. There have been no major drawbacks. The thing just runs and runs. We don't often have any hardware problems. We'd like a little more software.

What software do you lack?

We want more integrated software to allow the office to function together. The big problem there is that until we get enough workstations on people's desks, it doesn't matter — you're not going to do calendaring and vast electronic mail. Those things aren't much value if you can't get to the people you need. We feel we have to build up that mass before we can do things like calendaring automatically and get total use of electronic mail.

Ultimately, what I'm looking for is a more integrated set of software that allows all these functions to tie together almost anything you could do in the office from an administrative or document or general-function standpoint.

> ”
>
> *Ultimately, what I'm looking for is a more integrated set of software that allows all these functions to tie together almost anything you could do in the office.*

Does that software exist, even outside of Star and Ethernet?

I don't really think so. I don't think anyone has done it yet.

Is any vendor close to offering this total solution?

No, and we're talking to a lot of different people. I'm sure it's going to happen. People are coming along, but I don't think anyone's there yet. Maybe we're always going to be ahead of where the vendors are, so it's hard to say that end users are totally satisfied. I'm not trying to throw rocks, because it's a very difficult world we live in today. The vendors are trying to change, and we're trying to change. It's tough.

What percentage of the workers now have terminals on their desks?

We have roughly 27,000 white-collar workers — that doesn't include factory, plant or oil field staff — and we have about 9,000 workstations in one form or another. That includes IBM 3270 dumb terminals, in many cases. But still, they have a workstation of some kind. Many of those 3270s are for engineers, and they use them for real functions. So about one-third have something. There are about 1,900 people just in corporate and about 700 workstations.

Have the operating companies made the choice to go with Ethernet and Xerox?

No, actually, nobody else in the operating companies has a local-area network. There are several IBM Professional Office Systems.

Are you considered a test site for the operating companies?

We share a lot of what we learn. We meet four or five times a year. My boss, the vice-president of Administration and Technology, chairs [the meetings]. We bring my peers together. We look at overall policy. We also have a planning council and communications and research councils at various levels meet and share information. We have a reasonable communication. I don't think we're totally duplicating efforts.

Do you have a specific, written multiyear plan at corporate headquarters for introducing or spreading office automation?

We do. We did a strategic, long-range plan, but it's at a fairly general level. It's not down to device by device and when we're going to put them in, but [it tells] the areas where users want us to put devices in. We're moving rather cautiously right now, primarily because of economic hard times. We're taking a hard look at when the right time to do this will

be. We think in the long run it will be cost-effective. We have to prove our case thoroughly.

We continue to do pilots. For example, we have a project that will go in this year that is a combined look: from an office planning standpoint, from a communications viewpoint and from a systems standpoint. The three disciplines are working together to do a pilot with our employee relations people. We're expanding a pilot we did with them to put a workstation on everyone's desk in that unit and to give them more function. It will be a combination, using Ethernet and access to mainframes.

What specific applications are driving office automation?

Spreadsheets are obviously one. Then there's word processing. Graphics is the third area. Many people will say, "If I can have a spreadsheet and a terminal or a personal computer — wow, I can do this and thus and so." They really can cost-justify any number of things. But it's all the other things that they didn't think they were going to do that make the difference.

For example, our employee relations representative now mails all of her messages back and forth with my secretary. We don't make phone calls, at least not very often. When we put in the network, we never put it in with the idea that the two floors could talk together, though we recognized that they could. We've eliminated a lot of the time lag on things that we never thought about.

When employees on one of the floors not served by Ethernet ask for a stand-alone personal computer, is it your concern that whatever micro they get will eventually be able to work on the network?

Yes, we have an approved vendor list for hardware and software.

What models do you recommend?

Basically we're an IBM organization, and we have IBM. We have Xerox here at corporate. There are some Macintoshes growing throughout the corporation. Some of the operating companies have purchased Wang equipment. The basic three for corporate are Hewlett-Packard Co., IBM and Xerox right now. We're giving some consideration to Apple. We have approved Macintoshes for special situations.

It's a tough job to hook up that assortment of micros.

It is, but the IBM Personal Computer will work on Ethernet.

Is that a recent phenomenon?

We just really put it up in our last release in February. We've actually communicated between HP devices and Ethernet. We don't do a lot with it yet, but we could. It's technically feasible. We're not sure that's the ultimate network we'll have. I don't know what network we'll finally end up with. We're trying to piece the things together slowly.

One of the advantages we have in the corporate area that you wouldn't get in an operating company is that there is not a great need for finance to talk to public affairs. They do have some dialogue, but they don't use a lot of the same data, they don't do a lot of cross-communications, so there's no great need for sharing. We try to make everything SNA-compatible and IBM-compatible. That's one of our prime criteria. A vendor either is, or is going to be, IBM-compatible. Of course, everyone claims they're going to be, and they all are, to varying degrees.

Because you have IBM Personal Computers running on Ethernet now, does that mean you will purchase fewer Stars?

It depends on the functionality. We'll buy what we think is the right device for an individual's set of requirements. When people come to us — and most people come to us rather than make a decision on their own — and say, "Gee, I'd like to get a device. Here's what I think I need to do with it," you go through requirements analysis just like you do for any other system.

You have to understand if they want to do word processing or something else. And then you work out what's the best fit.

Does the president of Arco have a micro on his desk?

No, but there are personal computers for each of his three administrative staff. We now tie them together. They use them for his itinerary, his mailing list, all kinds of things, plus word processing. There are several other executives, including the chairman's office, where we're piloting [personal computers]. Ultimately, we'll probably tie them together, but we haven't attempted that yet.

Does that help make your case for OA elsewhere in the company, to show the president what computers can do?

I haven't seen a noticeable impact yet. Ultimately, will it? Probably. But short-term, there hasn't been a great impact, because it's not that noticeable. You'd have to publicize it. But they feel they're getting a lot of benefits out of it.

The one thing we have found is that once someone has a device on his desk, your chances of ever taking it away are extremely remote. There are some people who don't take to it, but not many.

What about your own use of computers?

I do everything verbally. I dictate everything. I don't type.

You don't know how to type or you don't like to?

I don't like to type. I can, but not very fast.

"Our engineers won't let you down. Even when our competitor's system does."

So you're a prime candidate for a speech recognition system.

Absolutely. That's the way I work. I dictate almost every memo of any size and all my speeches.

What are Arco's mainframe systems?

Our products companies have various 3080 systems, and Dallas is a very large center with a whole series of 3030s and 3080s — all the big mainframes. It's our main computing center for oil and gas, the seismic processing, engineering, all those things.

You would be a very interested observer of IBM's 3090 series?

Yes, very interested.

Do you need that power right now?

Undoubtedly we will, but we have no immediate plans to buy. I would anticipate that our marketing and our gas company would end up with 3090s in one form or another.

What systems do you have here at headquarters?

We have an HP 3000 that's really a decision support system for our finance people. Then we have some Four-Phase systems for public affairs.

We put it in many years ago and it runs and runs. We have links to IBM, lots of personal computers. I don't have a big mainframe back here, just because we find it more cost-effective to use the mainframe in an operating company here in Los Angeles. We have a number of IMS applications.

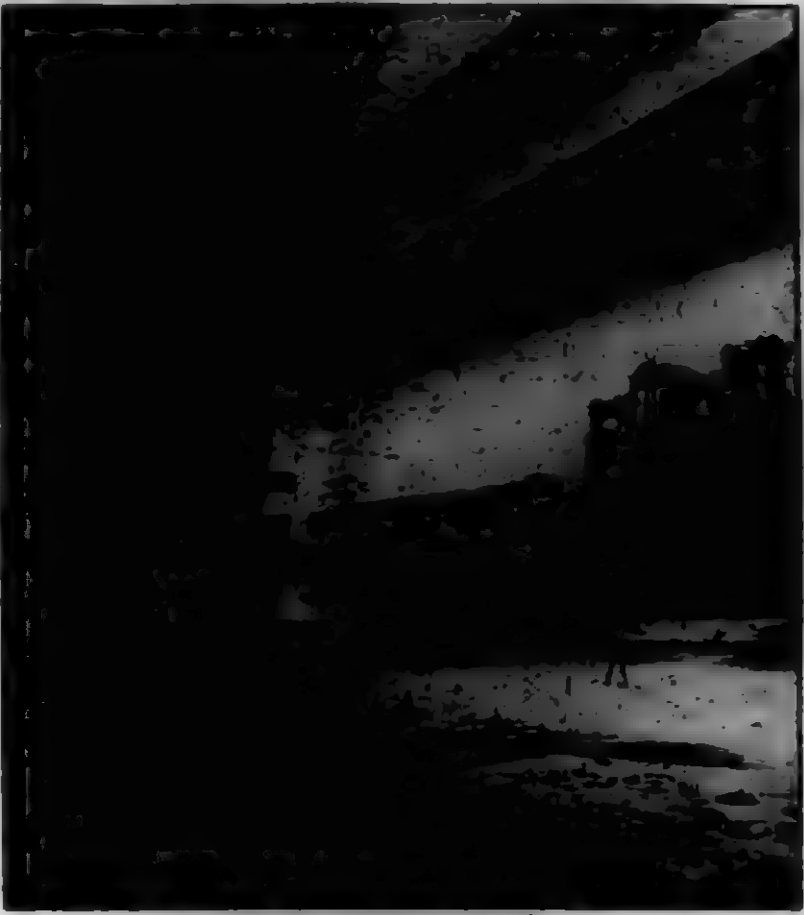
Do you personally interview and hire systems people?

Not as a rule. I do on some occasions, and I keep track of whom we hire.

For an entry-level person, do you prefer a computer science graduate or a liberal arts graduate you can train?

I just want very good people. The first thing I look for in my own hiring — I hire the managers — is that I want them to be good at communicating — I want bright, intelligent, outstanding people. That's the first thing I want.

At the corporate level, we don't have a lot of entry-level people, but we've had some computer science graduates and some MBA graduates, quite often with engineering backgrounds. I guess if I have a preference it's for MBAs with some other discipline in their background, but it's not an overwhelming preference. Talent is what counts, and quality, and you can get that a lot of ways.



Arco's Alaska Kuparuk pipeline

Are universities turning out the kinds of people you need for information systems?

We put most entry-level personnel through a training program. I think the colleges are doing a reasonable job; I think they could do a better job. The curriculum is getting better, more pragmatic.

The truth of the matter is that they teach them the basics, but what the real world is all about has to be taught on the job. I don't know if you'll ever git the colleges to do that, and maybe they shouldn't. I teach at UCLA myself off and on in the master's program.

What course do you teach?

Introduction to Information Services — basically, it's an overview of the whole field.

Is there a shift at Arco to end-user programming?

Oh yes, clearly that's going on throughout all the operating companies. A lot of students who don't have science degrees — MBAs and other students — come in expecting to have the tools at their fingertips. I'm firmly convinced that in some time frame, let's say five to 10 years, people are going to expect to have a workstation on their desks like they now expect a telephone. I don't think we're too far from it. And I believe it will be a workstation integrated with the telephone.

Has there been any corresponding easing of the load on data processing?

I would say in our development group in my organization, the demand is still there, and we have as many people working on it as we did. But we aren't growing as rapidly from a development standpoint. We're putting more resources into supporting end-user computing. For example, about 2½ years ago, I combined the pilot work we were doing in office automation into what I call professional computing support. It's a group dedicated to helping the end user. It supports our decision support system, office automation and workstations. If they want us to build a system, our systems development people do it in a more or less traditional way. But where we really impact those individuals is we teach them what we have to teach them. We'll help them if they need help, but if they can do it themselves, we encourage them.

Is that an information center?

In a sense it is, but it's more than that. An information center is just a label appended to an approach to giving people data that they can massage and inquire and use however they choose. That's not a great deal different than having a workstation with a spreadsheet — then you have to get some data or create the data. In most cases, the people in the information center don't do the work. They just get the data for you and you do the work as the end user. So I put all of those in a generic category that we call professional computing support — end-user computing, if you will. I just don't like the term. They're all driving to put tools on the desks of professionals so they can do their work. That's what we're after. When they want a system bigger than they can do, then they come to us and we build it.

How would you assess the position of Arco in terms of implementing and using leading-edge technology — an initiator, just behind the initiators, in the middle of the pack, far behind?

That's a tough question to answer. It varies by operating company, because it depends on the circumstances, both economic and size, and environment. We have some areas

Free buy or sell quote on VAX, RA-81's, TU 78's, VT220's, printers, networking, cluster gear and other DEC compatibles from...

where we are clearly initiators and some where we are behind the initiators a little bit and some in the middle of the pack.

In what area is Arco clearly an initiator?

In Dallas, we were one of the first to put a Cray in to do seismic processing. We've been innovative in using Ethernet here. We jumped into the information center fairly quickly. We're somewhere between middle of the pack and right at the state of the art.

Is that where you would like to be?

Yes. We don't want to lose our competitive edge with respect to our own industry. But I think the technological impact of computing is somewhat different for the oil industry than it is for finance or the airlines industry. We have some very big technology decisions that have little to do with computers, such as how to drill for oil in the North Slope. So it's a combination of pure hard technology and computing technology. Now, the pipelines are automated, and our refineries are automated to a great extent. Data processing numbers for Atlantic Richfield are roughly $300 million a year. There are roughly 2,500 people in computing.

How does Arco get information from the oil field to the headquarters?

We were one of the first to put some kind of microcomputer in our drilling and production sites. For our seismic data, we actually take the shots and communicate the data to the main computer in Dallas.

Are expert systems used?

We're looking hard at expert systems, but nothing is in place right now. Are there opportunities? — Oh, yes, there's no question that there are opportunities. We have a couple of task forces looking at it.

Recent ads for Arco emphasize innovation. What part can information systems play?

We do play a big role in innovation. One of the ways is to give people end-user computing. If they use it more effectively, then it's clearly to the benefit of the corporation. Arco puts a lot of emphasis on more innovation, more productivity, from our president right down.

What previous positions have you held here?

I joined Arco 12 years ago as a systems consultant. After a couple of years there, I was promoted to managing the corporate and DP auditing function. I did that for 2½ years and then moved to this job.

What was your experience before Arco?

I have more than 26 years of experience — six years with the Computer Science Corp., a couple of years with General Electric when it was in the computer business and four or five years with an end-user organization before that. So I've been with a user and a vendor and a consultant, a little with everyone. I somewhat intended it that way, but who knows where your course is going to end up when you start out to do something?

I fell into computing when I got out of college. I have a bachelor's degree in economics with a minor in accounting, and I set out to get into the accounting field. But I got one job offer to get into systems before I got the job offer to get into accounting. Since I was young and needed money at the time, that's the one I ended up with. I have no regrets. I sort of knew what systems was. I had some friends in school who had gotten into it, so it wasn't a total accident on my part. But I didn't realize what it would mean to me in years to come. I've gone back to get a master's degree from USC in business management, and I've done a lot of doctoral work in management at USC.

As a systems consultant here, you weren't managing anyone, I assume.

I had been a manager at Computer Science Corp. I was first a manager when I was 25 — I managed a systems group about four years out of college, because there weren't a whole lot of folks around, so you moved up quickly if you could survive and do it. I've done a lot of management work and individual contributor roles over time. I prefer the management role.

What do you like about it?

I enjoy getting the job done through people and working with people — also the broader perspective the management role gives you. You have to look at the whole picture; you can't just worry about a project. Project work can be fun at times, but I prefer the management role.

How many people report directly to you?

Three people, right now. We're probably going to restructure, so it will be five.

And through them to you?

Right now, about 80 people.

If I were to talk to the three who report to you directly, what would they say about your style or philosophy of managing?

That's interesting. We just went through a survey recently and got some feedback on that. I guess they would say that I am a delegator, that I let them do the job. I trust people. I don't want any problems buried. I like to know what's going on, but I don't look over their shoulder every 30 seconds. We have a fairly participatory environment here. My basic philosophy is this: We can solve almost every technology problem there is one way or another. The real issue in business — and it is true in

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:

- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC, PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

IBM, IBM PC, PC XT, 3270 PC, XT/370, PC AT, and AT/370 are registered trademarks of International Business Machines Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

IN DEPTH/INTERVIEW: AL SMITH

systems and every other discipline — is how well we communicate — for the staff and management, both written and every other way. That's the real key to being successful. So I work hard at trying to talk to the staff, talk to the management. I think we're successful, but they would have to tell you.

Are systems people particularly difficult to manage?

I don't think so. I've managed financial auditors and systems folks and some other types. The idea that systems people are different somehow is a bit of a myth. They are creative people and some can be difficult, but that's true in any field. It may have been more that way in years past than now, more prima donnas years ago than today.

Are there some very unique individuals? — yes.

What methodologies are used in systems development to get those unique, as well as more "average," people working together?

We use a form of traditional life-cycle methodology. We don't do anything particularly unique. We try to stress that it is a guideline and not a bible. You have to be careful with methodologies that you don't make them so rigid that people follow methodologies down the primrose path. The systems business is changing; we need to be more flexible about our methodologies.

On a $5,000 personal computer, you don't do a $75,000 requirements study to determine what you want to put on it. You just don't do that. You have to learn how to balance those things. That's not easy to do. The methodology is important. You've still got a document, you still have to follow a process. We try to do that. In each of the operating companies, we have some form of methodology; sometimes it's very structured.

What would you advise a systems person 25 or 30 years old about how to aim for your job?

That's a good question. I wish I knew the answer.

Do you wish you had that advice 20 years ago?

Well, I guess I set out to do more or less what I'm doing. It was my goal to continue to manage in this area, perhaps to do more general management. For a long time, I wanted to be a manager in some form or another. I think you have to have a variety of exposure and experience. You have to learn to communicate, learn to work with people — that's one of the critical variables if you want my job, because my job is meeting with people, coordinating and communicating at multiple levels.

Can someone really learn to communicate like that?

That's the "Are leaders born or made" question, I suppose. My view would be that you can learn, you can make your skills better, become a better communicator. You can't fake it. If you don't like people, that's going to come out. If you really want to work in the backroom and never see a human being, then you ought to be a systems programmer and put in operating systems. If someone has those kinds of characteristics, then they probably don't want or shouldn't want my job. That's a small percentage of the systems population.

Do most of your technical people want to rise to managerial positions?

Probably the majority would prefer to rise to a managerial position rather than to a senior technical guru. We do have a technical ladder. We're trying to make it stronger and better. It's not quite where I would like it to be yet.

What's at the top of the ladder?

We call it a "senior technical consultant." It's a grade-level equivalent to a manager who would report, if not to me, at least to the person who reports to me. We think we can get him another notch or two higher with a little effort.

Is that a recognition that there needs to be a way of keeping technical people happy and doing what they like?

That's right. I don't know what percentage, whether 60-40 or whatever, that would rather be generalist than technical. But there are some who just don't want to be managers. And we have to accommodate them to keep the talent.

You said one of your goals might be to move into general management. Does such a position exist within Arco where an information systems person can move?

We have had people move out to the finance area or general management, so there is some precedent. It is not widespread. Different companies have different primary paths. For a company like us, it tends to be the engineering side of the house.

Does data processing still have to shake the backroom image here?

I think in general that's true, and I suppose there is some of that here. In most large corporations, there is some truth in that. If you look at banking, it tends to have less of a backroom image than perhaps an oil or manufacturing company might have. That's very dependent on the company, function and business.

Is there a chief information officer at Arco?

No, there isn't. Probably the closest is the function my boss has — he's the vice-president of Administrative Services for the corporate group and also has the interface to the operating companies. I believe in the concept and think we'll probably evolve to it.

WHAT TO WARE TO SURVIVE THE HIGH SEAS OF BANKING

Ware something extraordinary. Ware INFOPOINT℠ banking software by UCCEL. The most complete, most proven line of integrated financial software on the market. The software that keeps you cool in calm waters no matter how turbulent the market gets.

With INFOPOINT's 21 major applications, you'll not only survive — you'll survive in high style. And continue to grow and prosper — even while others are going under. What's more, INFOPOINT costs less than ordinary software and can be implemented in less time.

IMAGE PROCESSING COMES TO THE OFFICE

By Elias Safdie

Image processing allows the user to capture, maintain, manipulate and distribute pictorial information in the same way as classical word processing and DP files.

The paperless office has proved elusive. Documents generated on a word processor can be corrected so easily that users may completely reprint a five-page memo to correct a spelling error on the first page, thus generating more paper rather than less.

A technology new to the office, however, could cut back the use of paper. Image processing — the digitizing of photographs, pictures and other pictorial material — will allow banks to verify signatures, insurance companies to process handwritten applications and law enforcement agencies to match fingerprints found at the scene of a crime with those already stored in their data bases.

Image processing is not a new technology. In the last decade, the space program has used it to beam down pictures of the heavens; the

military has used satellite-based image processing equipment for intelligence gathering; manufacturing systems use image processing for automatic fault detection.

Today, image processing is entering the office for two reasons: There is a need for it, and image processing equipment has gotten much less expensive because of advances in semiconductor technology.

Commercial market

Seven image processing systems are available now in the commercial marketplace. In the next 12 months, users will begin to see more sophisticated systems with great potential for easing office operations. Generally, the most popular of these systems will be multifunctional rather than dedicated and will consist of a minicomputer, large magnetic disk files, high-resolution terminals, scanners and printers.

> ”
>
> *Besides allowing users to incorporate pictorial information in office documents, image processing allows users to manage this information electronically.*

Because pictures convey more information more quickly and accurately than do words, it is especially important to use pictorial information in daily communications with colleagues and customers.

Consider the case of a sales proposal in which a system configuration must be described. It is much easier to simply insert a picture of the configuration (see Figure 1) than to attempt to describe all the pieces of equipment and their interrelationships.

Besides allowing users to incorporate pictorial information in office documents, image processing allows users to manage this information electronically. If one looks at a typical office environment, one sees a large number of documents that include pictorial information — signatures, logos, line drawings and handwritten notes.

As a result, most offices today maintain two sets of files. One set is electronic and holds word processing documents, spreadsheets, data base information and any other information that can be entered through a workstation keyboard. The other set of files is paper, because there has not been a mechanism for capturing and maintaining the pictorial information.

Image processing, however, would allow the user to employ minicomputer-based technologies to capture, maintain and distribute this nontextual information in the same manner as the classical word processing and DP files.

From an office perspective, image processing deals with the use of computer technology to acquire, manipulate, file and distribute pictorial information. Images can be obtained and entered into a computer system to generate an image. Once an image is digitized or generated, image processing allows the user to manipulate it.

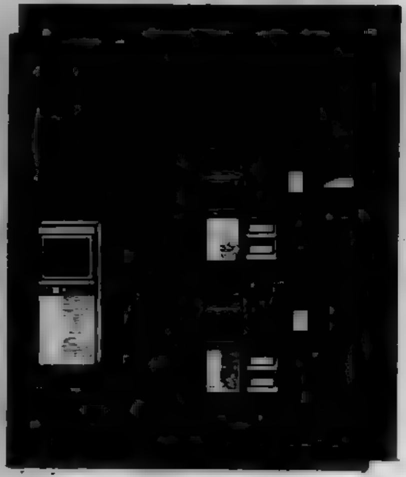

Figure 1

Users can manipulate an image by cropping it — removing unwanted portions to change the orientation —and zooming (blowing up) or shrinking the image to do page makeup.

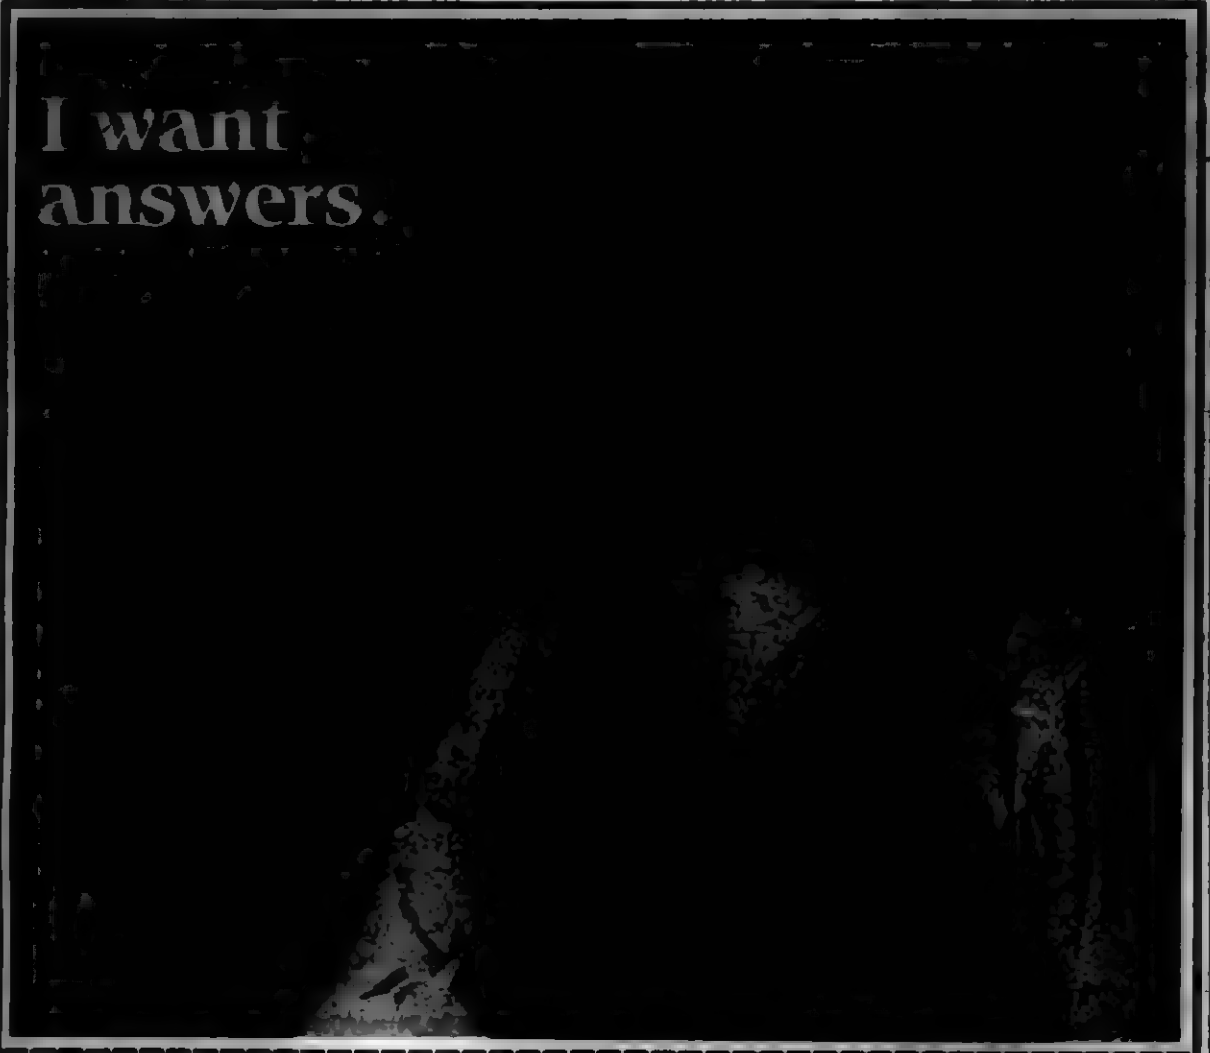
The zoom and shrink capabilities are especially important because they put the user in control of the document. Without these two capabilities, the user is constrained by the original size of the image. With them, the user can make the picture the desired size, place it in the desired location and combine it with text to convey a message.

Storage and retrieval

Storage and retrieval techniques are of paramount importance in the document management applications. With image processing, it is now possible to view images as a response to a data base query.

A real estate customer, for example, might want to see all the homes that are available in a certain district, in a particular price range and of a particular architecture. A data base containing all this information can be coupled with pictures of the homes and their floor plans, and within minutes the customer could see — without leaving the realtor's office — which homes are available that meet his search criteria.

Admittedly, one of the costlier aspects of image processing is the amount of data generated by the process. Figure 2 on ID/14 shows the relationship between resolution and number of bytes required to represent the image.



I want answers.

Why the time has never been better to get your own subscription to Computerworld.

FREE CLOCK WITH YOUR SUBSCRIPTION.

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desktop piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

UNIX is a trademark of AT & T Bell Laboratories.

☐ **Yes!** Please enter my subscription for one full year (51 issues) of *Computerworld* at $44. Plus all 10 COMPUTERWORLD FOCUS issues at no extra charge . . . plus my FREE gift with my paid subscription. (Please allow 6-8 weeks for shipment of your free gift.)

THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

6AO8401

Semiconductor manufacturers are now working on a compression chip that will meet the Consultative Committee on International Telephone and Telegraph Group IV standard for facsimile compression. This compression scheme is expected to yield faster, greater compression ratios on the order of 12:1 and better. This will make disk storage and telecommunication of images much more affordable than they are today, in some cases cutting those costs in half.

Distributing the image

The combination of minicomputer and image processing technologies allows the images that were digitized or generated to be electronically transmitted to remote sites.

For example, if a real estate broker does not have a house listed that suits a customer's needs but the realtor is part of a multiple listing service or belongs to a firm with several branch offices, he can search the branch offices' data bases.

The information within those data bases, including pictures of the homes they contain, can be transmitted to the real estate broker.

In essence, image processing in combination with telecommunications allows the user enhanced facsimile services — enhanced because the documents can be filed and retrieved at will and because minicomputer and telecommunications technologies offer better error detection and correction capabilities that help ensure the fidelity of the received image.

Figure 2

Two primary justifications exist for the use of image processing in the office: compound document applications and document management applications.

Compound documents integrate data, text and image information. These include, for example, sales proposals, which typically have illustrations of equipment or process flows; manufacturing change notices; engineering documentation; service manuals; and in-house training documents. In this class of applications, the objective is to use the image to convey information more efficiently.

When it comes to document management, classical transaction processing involves the storage and retrieval of data and/or text. Image-based transaction processing adds the dimension of pictorial information to classical transaction processing systems.

As mentioned earlier, many applications today involve two sets of files: an electronic file, which deals with alphanumeric information, and a set of paper files, which store the nontextual information. Banks, for example, have electronic files for account information and paper files for customer signatures. A bank using image processing, however, would not need the paper files to store customer signatures.

Why in the office?

Once a file is stored electronically, the user can enjoy a number of secondary advantages, among them the virtual elimination of the problems associated with manual filing. Users can employ the data base management facilities of minicomputer technology for rapid, accurate retrieval of the information. In the case of the bank, the signature could be accessed by keying in the customer's passbook number.

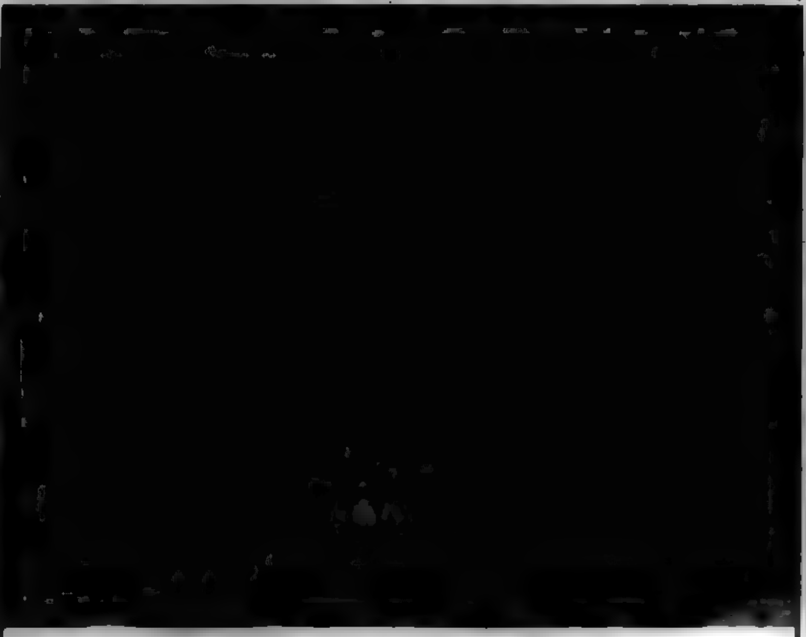
As a further example, consider an office that processes handwritten orders. There is often a need to refer to the original order, even after the data has been keyed in. Image processing would allow the user to go back to the source document either directly or by querying a data base if the user was unsure of the specific document required — no more lost files or misplaced files and no time lost in finding or re-creating the source document.

Example of benefits

Insurance companies provide a good example of the benefits to be derived from combining image processing with telecommunications. Studies have shown that the longer it takes to generate a policy from the time the application is submitted, the greater the likelihood that the customer will refuse the policy.

> ***Image processing in combination with telecommunications allows the user enhanced facsimile services.***

It therefore becomes important to minimize the time it takes to underwrite and generate a policy from a source document. Image processing can be used to eliminate two costly delays: mailing applications to central offices for underwriting and mailing back a completed application, including authorizing signatures. Such a use of image processing directly and dramatically affects a business's bottom line by promoting faster, more efficient and more exact communications among office workers.



SUCCESSFUL SALES PEOPLE
ARE GOOD FOR YOUR SYSTEM.

SDI Support Systems creates product knowledge training programs that give your new product and your sales people a powerful competitive edge.

From mainframe to micro, for data processing hardware or software, SDI sales support programs are good for your system.

Reach over 40,000 computer professionals in Brazil.

Your ad in CW Communications' Brazilian publications will reach a multi-billion dollar computer market. At the end of 1984, there were approximately 9,000 mini and mainframe installations in Brazil valued at $3 billion. According to International Data Corporation (IDC), the world's leading information industry research firm, Brazil's mainframe market will grow 20% annually and micros are predicted to grow 30% annually over the next five years. CW Communications covers the Brazilian market with two important publications: *Data News* and *MicroMundo*.

Data News reaches 12,500 Brazilian DP professionals weekly. It covers new products and services, current applications and latest industry developments and trends.

MicroMundo is the only microcomputer publication in Brazil. Each month, 30,000 Brazilian micro and personal computer users read *MicroMundo*. The editorial keeps users up-to-date on all current news in the micro world.

CW International Marketing Services makes advertising your new products in Brazil, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon and mail today.

How image processing works

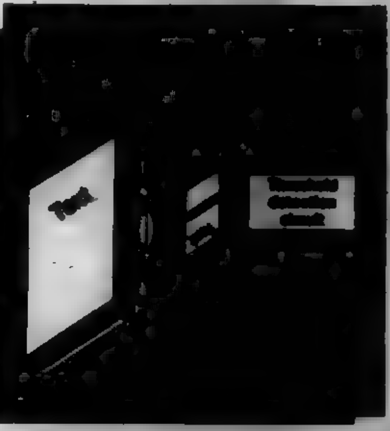
Images can be obtained and entered into the image processing system either by capturing an existing image or by generating an image using the system itself.

An already-existing image is captured by means of a digitizing camera, also known as a scanner. Most scanners on the market today use charge-coupled device (CCD) technology. Charge-coupled devices are light-sensitive semiconductors that generate electric charges in proportion to the intensity of light incident upon them.

The figure at right shows how the charge-coupled device is used to convert the image to pixels. A light source illuminates the source document. The reflected light is projected via a set of lenses onto a linear array of charge-coupled devices.

Each charge-coupled device is responsible for measuring the reflected light from a small area of the page. If there is no ink on that particular area, there is a lot of reflected light, which in turn causes the device to generate a large charge.

If there is ink on that area, the ink absorbs the light, causing little light to be incident on the charge-coupled device, which in turn will cause a smaller charge to be formed. The charge on each device is then measured to determine whether to illuminate a pixel on the video screen.



The result is shown in the figure below. The number of individual charge-coupled devices and the area that each one views together comprise the concept of resolution, or granularity of the resulting image.

As an example, if the desired resolution is 120 dot/in., one would need 1,020 charge-coupled device elements for an 8½-in.-wide document. Rather than replicating the 1,020 elements vertically as well, multiple scans are used. For an 11-in. document at 120 dot/in. resolution, it takes 1,320 scans to capture the entire document.

Generating images involves using the system to draw lines, circles, arcs and other geometric functions to create images. Font generation capabilities are also useful to annotate the images that are generated or captured. Often it is necessary to start with a digitized image (a logo, for example), add some machine-generated images to it and annotate the composite image with multiple fonts before inserting it into a document. Once the image is generated, the user can begin to manipulate it.

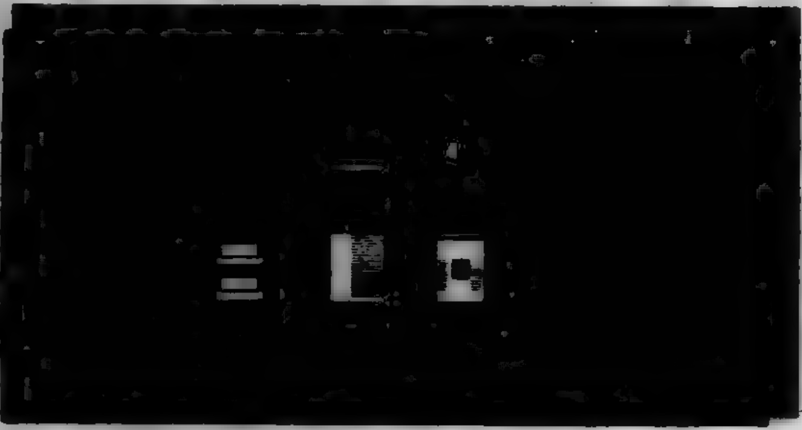
Image processing vs. micrographics



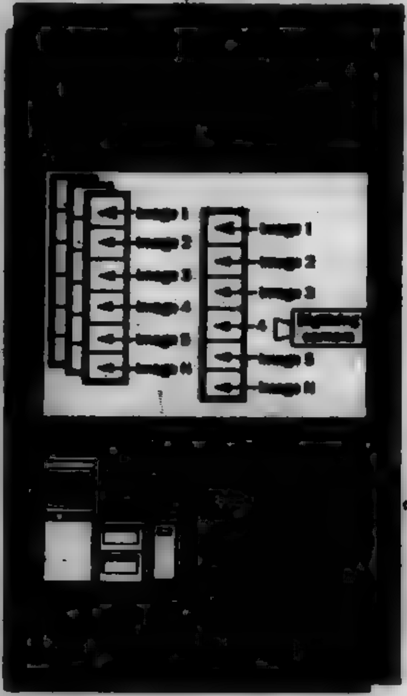
Some offices today use micrographics as a way of dealing with the paper problem. Micrographics is a generic term that includes any film-based optical storage in reduced form, such as microfilm, microfiche and 35mm aperture cards.

Some systems on the market combine the micrographics technology with minicomputer data base and file management to produce what are known as computer-assisted retrieval systems. These systems use the minicomputer file management to keep track of the location of each document in the computer-assisted retrieval system. Typically, two viewing screens are required — one for the alphanumeric interaction with the minicomputer ("I would like to see page 25 of the specifications for the lighting fixtures") and one on which the film-based image is displayed (see figure at left).

Other drawbacks

In addition to the need for two screens, there are also several other disadvantages to these systems:

- The user must be at the location of the film-based equipment to view the image.
- Only one user can view the image at a time.



- Hard copy involves expensive photosensitive paper.
- Transmission of documents is not possible.

Users who want to eliminate these disadvantages can replace the film projection mechanism with a digitizing camera and the alphanumeric terminal with an image terminal (see figure above).

The user can still query the data base for a particular document, and the computer-assisted retrieval unit will still retrieve the appropriate film. Instead of being projected onto a viewing screen, the film image will be digitized by a camera inside the unit. The advantages are the following:

- Only one terminal is required for both image viewing and interaction with the filing system.
- Once the image is digitized, multiple users may view the image simultaneously and the unit is free for another user to view another image.
- Users do not have to be at the film unit to view the documents.
- Hard copy is easier and cheaper to produce using dot matrix or nonimpact print technology.
- Documents can be communicated electronically.

About the author

Elias Safdie is responsible for image product marketing within Honeywell, Inc.'s Office Management Systems Division, based in Billerica, Mass. He holds several patents in CRT terminal design.

Buy a stat mux from Micom, ComDesign, Tellabs or anybody else and here's what you get.

On the other hand buy the STEAMER from Datagram and you'll look like a hero.

Because STEAMER can do more than any ordinary stat mux. Why? Well, it's a combination of an extremely powerful data compressor and an extremely efficient statistical multiplexer.

That's why it achieves data compression ratios better than anyone else's. And why it compresses the uncompressible. Even object code files or graphics data. And why, it's revolutionized the data communications industry.

So, if you're thinking of buying an ordinary stat mux, don't. Not until you talk to us. Call 1-800-235-5030 today. We'll tell you how STEAMER can make your network work harder than it ever has before.

MICROCOMPUTERS

Digital Research offers enhanced DOS version

By Eric Bender
CW Staff

MONTEREY, Calif. — Digital Research, Inc. has released Concurrent DOS 86 Version 4.1, an updated version of its Concurrent DOS operating system that supports high-end IBM-compatible machines, Microsoft Corp. MS-DOS 2.1 applications and Digital Research's Graphics Environment Manager (GEM) software.

A version of Digital Research's Concurrent PC DOS retail package based on the upgraded operating system is expected to ship today for $149. The software reportedly will permit microcomputers built around the Intel Corp. 8086 family to run multiple MS-DOS or Digital Research CP/M application programs simultaneously. Applications may take the full screen or run within windows, according to Digital Research.

In Fortune 1,000 companies, concurrency will prove particularly useful in acquiring large data bases, handling communications tasks and printing, said Michael Loftus, Digital Research's systems software marketing manager.

Multiuser operations reportedly also are supported, with up to four applications running on the system terminal and two additional serial terminals each running one application.

The operating system includes a character-based file manager aimed at helping users find their way among directories. Users can employ standard MS-DOS commands or load GEM applications if they want a graphics-based interface, Loftus said.

The DR Talk communications package, a card-file data base manager, a screen

Gem Draw receives praise for 'Macintosh-like' traits

By Kathleen Sullivan
CW West Coast Bureau

NEW YORK — In interviews with a group of early users, Gem Draw, a graphics package released by Digital Research, Inc. last month, gathered kudos for bringing "Macintosh-like" capabilities to the IBM Personal Computer.

"Gem Draw is what every Personal Computer lover would want if they have ever looked with envy at the [Apple Computer, Inc.] Macintosh and its graphics software and said, 'I wish I could do that on my Personal Computer,' " said Robert Kalipetes, an assistant vice-president in Citibank NA's New York office.

Kalipetes, who has been using Gem Draw to produce system flowcharts for Citibank, said he has tried other graphics packages. But none of them have measured up to Gem Draw, he said. Kalipetes said he even preferred Gem Draw over a program designed specifically for creating flowcharts.

Unlike the flowchart program, which gives users a limited number of sizes of flowchart symbols, Gem Draw allows users to create objects of any size, Kalipetes said.

Ben Knutson, a software design engineer in the engineering technology organization at Boeing Aerospace Co. in Seattle has been using Gem Draw to create charts for design review presentations. Recently, Knutson used Gem Draw to create a chart showing a network of personal computers for a U.S. Navy contract.

"I drew pictures of the terminals and showed how they would be networked together with a block diagram," Knutson said. "I was able to show exactly what the

Will DP join in AI parade?

Will many DP shops sit and watch the artificial intelligence parade march by and then begin a long and costly scramble to try and lead the parade — just as they did with minicomputers, word processors and personal computers?

Many people in the AI community say yes.

Data processing often "is deeply embedded and has a great deal of momentum and inertia," said Chet Rindfuss, an instructor in computing at Boeing Computer Services Co. in Seattle. AI proponents are "suddenly trotting into the corporation and saying, 'OK, guys, we have something that really works — where are the big bucks?' " he said.

If they don't get it from DP, they'll simply go elsewhere, he suggested.

Of two dozen major AI projects completed or under way at Arthur D. Little, Inc. (ADL) in Cambridge, Mass., "DP is intimately involved in only one," commented ADL consultant Dennis Barlow.

At some ADL clients headquarters, groups working with AI-based tools have their own box on the corporate organizational chart. "This is not so generic as word processing," Barlow noted, but it does promise large strategic advantages in many industries.

Large AI programs require massive computing resources, of course.

"A 3,000-rule system will grind to a halt except on the largest machines," another expert pointed out.

One prominent mainframe natural-language program "dims the lights when you run it," one MIS manager joked.

But as microcomputers become more powerful, and better low-end AI tools

WHO IS THE WORLD LEADER IN IBM/38-36 BACKLOG REDUCTION?

FUSION

The world's most successful companies have made Fusion Products International the leading supplier of query/report-processor, PC interface and spreadsheet software for the IBM System/34/36/38.

Why is Fusion number 1, worldwide? Because we fully support the PC. Because we're one of the few S/38-36 vendors who actually answer their customer-service telephones. Because we offer on-site training. Because *easy-to-use* means never having to read your manual. Because selected Fusion products are available in many languages. Even Japanese.

That's why the leading software company in Japan selected Fusion as their *only* S/38-36 report processor. The *best and brightest*, everywhere, choose to spend their valuable time on business issues, not on computer issues.

You probably know our name. Isn't it time you made a most important phone call? Isn't it time you used Fusion power to obliterate your backlog?

FUSION

Fusion Products International 900 Larkspur L.C. Suite 295 Larkspur, California 94939 Telephone 415 461-4760 Telex 170060. Also in New York and Newport Beach.

Sorcim Easyplus gets upgrade, net version

SAN JOSE, Calif. — Sorcim/IUS Micro Software has enhanced Easyplus, a windowing environment that runs on an IBM Personal Computer, and announced Easyplus Network Manager, an Easyplus version that runs on 3Com Corp. local-area networks.

Easyplus 1.1 supplies up to 10 windows and enables a user to load a number of IBM Personal Computer packages into memory at one time and move from one application to another, according to Sorcim/IUS. The windows can occupy a full screen, overlap or be placed side by side. A user can transfer data between any two windows, and each window has its own Help facility. The product features Easykeys, which are 10 user-defined command keys that store up to 20 keystrokes. Easyplus can send output to a screen, printer, DOS file or any combination simultaneously.

Easyplus Network Manager features file- and record-locking capabilities and supplies password protection for each application. Easyplus runs on a Personal Computer with 256K bytes of random-access memory and IBM's PC-DOS 2.0.

Easyplus costs $149. A four-user version of Easyplus Network Manager sells for $395, and an eight-user version costs $595.

Sorcim/IUS is located at 2195 Fortune Drive, San Jose, Calif. 95131.

TI NaturalLink: user-friendly software with a developer-friendly tool kit.

TI makes it easier for developers to make software easier for PC users.

TI's innovative NaturalLink interface eliminates complex commands by translating them into the user's language: plain English. And the TI NaturalLink technology tool kit lets you develop interfaces for new or existing software in a way that speaks your language: simplicity. And better sales.

The tool kit contains all the software and manuals you need to design, develop and test NaturalLink applications — quickly — on the TI Professional Computer. And our NaturalLink IBM® option contains the linkable object code you need to run your programs on the IBM PC, XT, AT or compatibles.

For more information or a demonstration, call us at 1-800-527-3500 or mail the coupon. We'll prove how developer-friendly we can be.

You're speaking my language, TI.

AST offers adapter for IBM AT

IRVINE, Calif. — AST Research, Inc. has introduced an adapter board that allows an IBM Personal Computer AT running the PC Xenix operating system to support up to four users or devices.

The AST Fourport/XN adapter includes Xenix device driver software that is said to tell the operating system how to communicate with the AST board. The device driver can simultaneously support two boards, each with four ports, according to the vendor.

The board includes a diagnostic capability that reportedly will ensure that terminals and other peripherals connected to the Personal Computer AT are configured correctly. The diagnostic program can interactively request information from users to determine the proper setting for each port, the vendor said.

The AST Fourport/XN costs $495, including four RS-232 ports, the Xenix drivers and an installation utility.

AST Research is located at 2121 Alton Ave., Irvine, Calif. 92714.

Apricot micro bows

FREMONT, Calif. — Apricot, Inc. has introduced a $995 personal computer running the Microsoft Corp. MS-DOS operating system and reportedly offering 512K bytes of memory and a single, 720K-byte, 3½-in. diskette drive.

The Apricot F1 reportedly includes the Digital Research, Inc. GEM Desktop graphics interface, an icon-based user interface, infrared keyboard and mouse and color graphics capability. The machine can be linked with up to 32 other Apricot computers under the Apricot Point 32 network. The Apricot F1 is said to use the Intel Corp. 8086 microprocessor and will be available in June.

Apricot is located at 47173 Benicia St., Fremont, Calif. 94538.

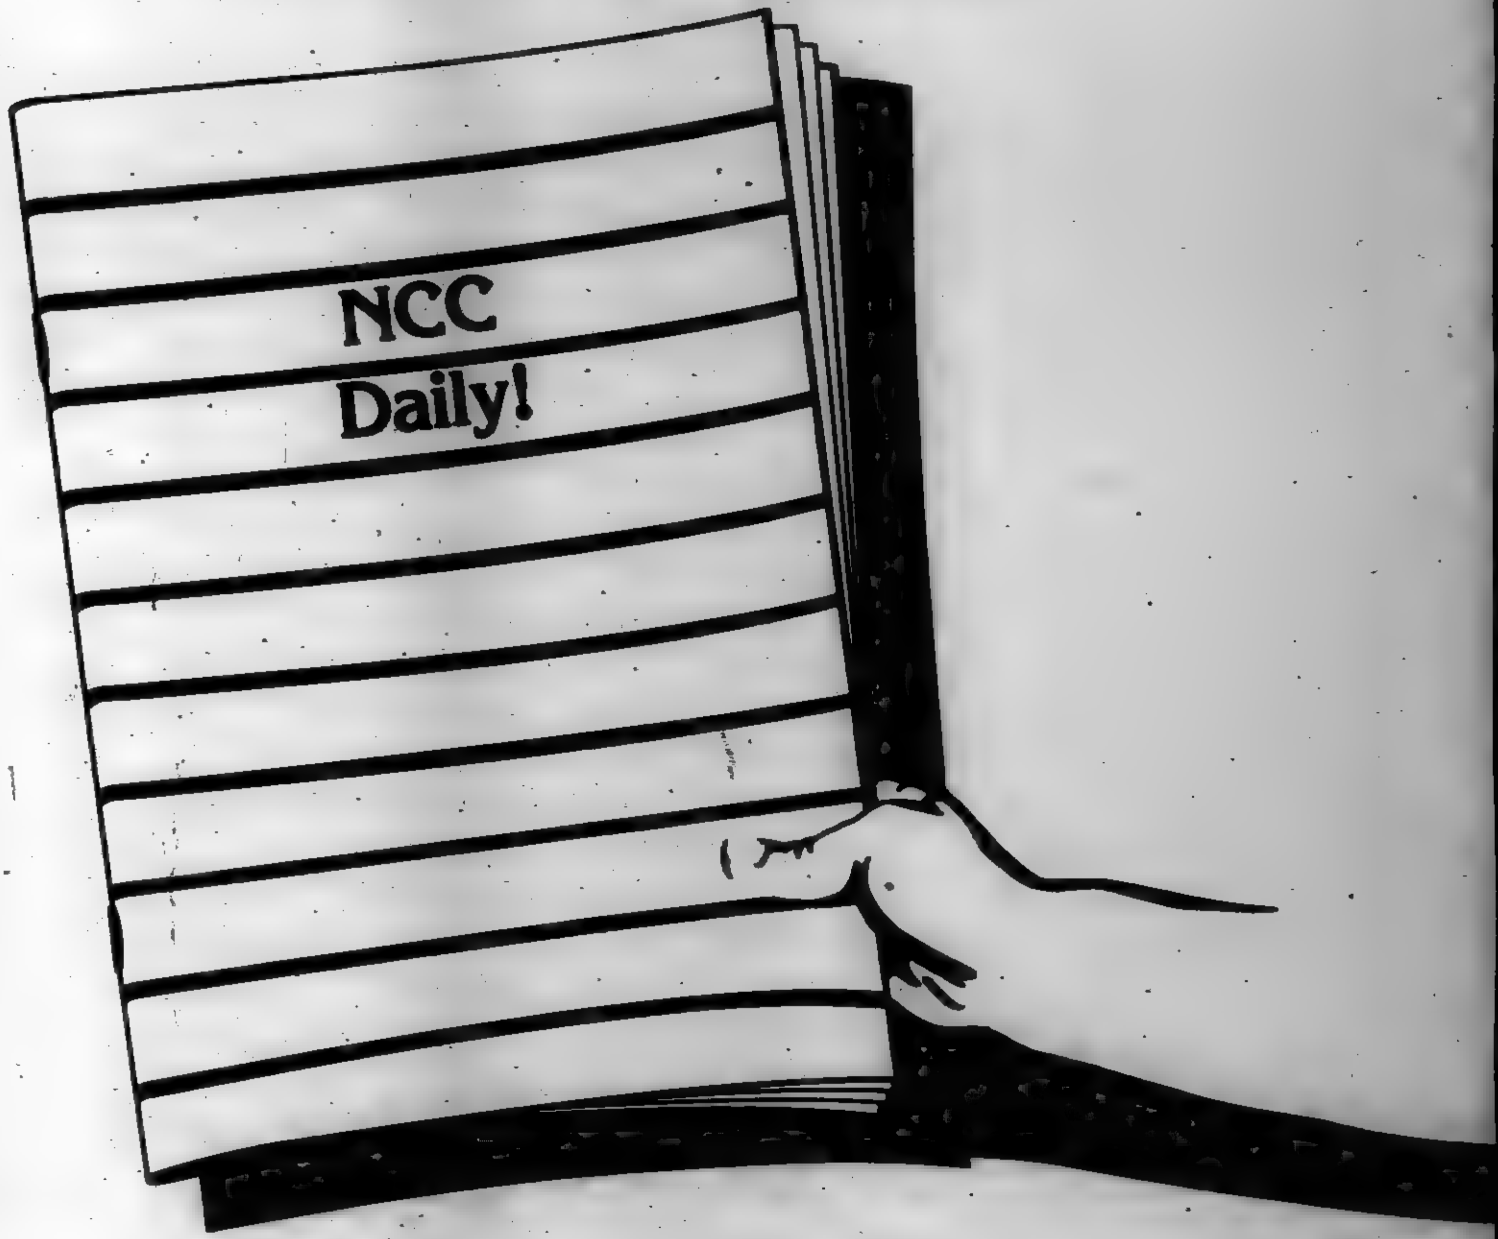
Announcing the NCC tour guide



The National Computer Conference (in Chicago this July 15-18) is so big, attendees need a guide to the show. Something like a tour guide. To make sure they see everything they came to see.

And because NCC is so big, you need to tell your customers and potential clients how to find your booth. To make sure that you get a good return on your investment.

Computerworld will be at NCC with help for the attendees and the exhibitors. We'll publish four separate issues of the always popular *NCC Daily!* And we'll distribute 25,000 copies each morning of the show. So your ad will reach your target audience just as they're deciding which booths to visit.

Each issue is sure to be well read. We'll provide attendees with on-the-spot coverage of the major product announcements, speeches, and technical programs. Interviews with top industry personalities. A schedule of events for the day of issue *and* the next day. Plus a guide by local experts to Chicago's restaurants, museums, and entertainment.

We'll also cover NCC in three special issues of Computerworld. The July 8th Preview issue. The July 15th Show issue. And the July 22nd Wrap-Up issue. Advertise in these issues and ensure your investment in NCC. And, just as importantly, you'll keep your name in front of more than 687,000 computer-involved professionals all during this eventful period.

Space is limited in the *NCC Daily!* Ads will be accepted on a first come, first served basis. So reserve space for your ads today. Call your local sales representative. Or call Ed Marecki, National Sales Director, at (617) 879-0700.

Issue	Issues Dates	Closing Date
NCC Daily!	July 15, 16, 17, 18	June 10 (all 4 issues)
NCC Preview	July 8	June 21
NCC Show	July 15	June 28
NCC Wrap-up	July 22	July 5

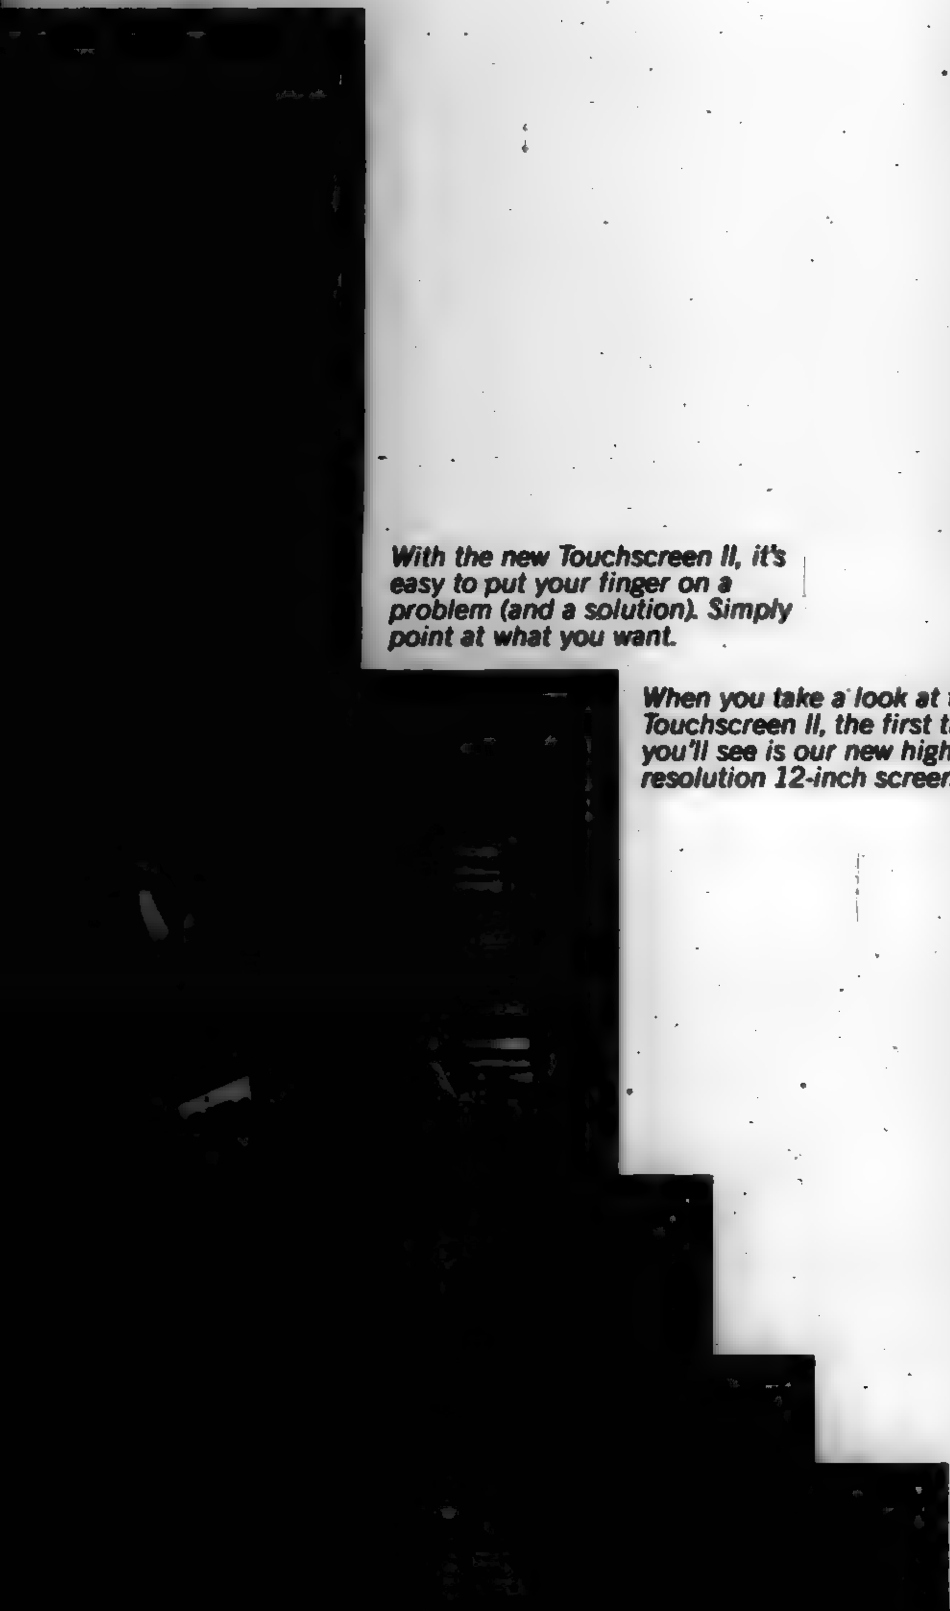
INTRODUCING THE HEWLETT-PACKARD TOUCHSCREEN II

OFFICE AUTOMATION MADE EASY. POINT BY POINT.



With the new Touchscreen II, it's easy to put your finger on a problem (and a solution). Simply point at what you want.

When you take a look at the Touchscreen II, the first thing you'll see is our new high-resolution 12-inch screen.

The new Hewlett-Packard *Touchscreen II* personal computer is the mainstay of an office automation system designed to be easy.

Easy to learn■ Easy to operate■ Easy to place in an office information network.

In short, *Touchscreen II* makes it easy to be productive■ Here are a few pointers.

WHEN YOU SEE WHAT YOU WANT, POINT.

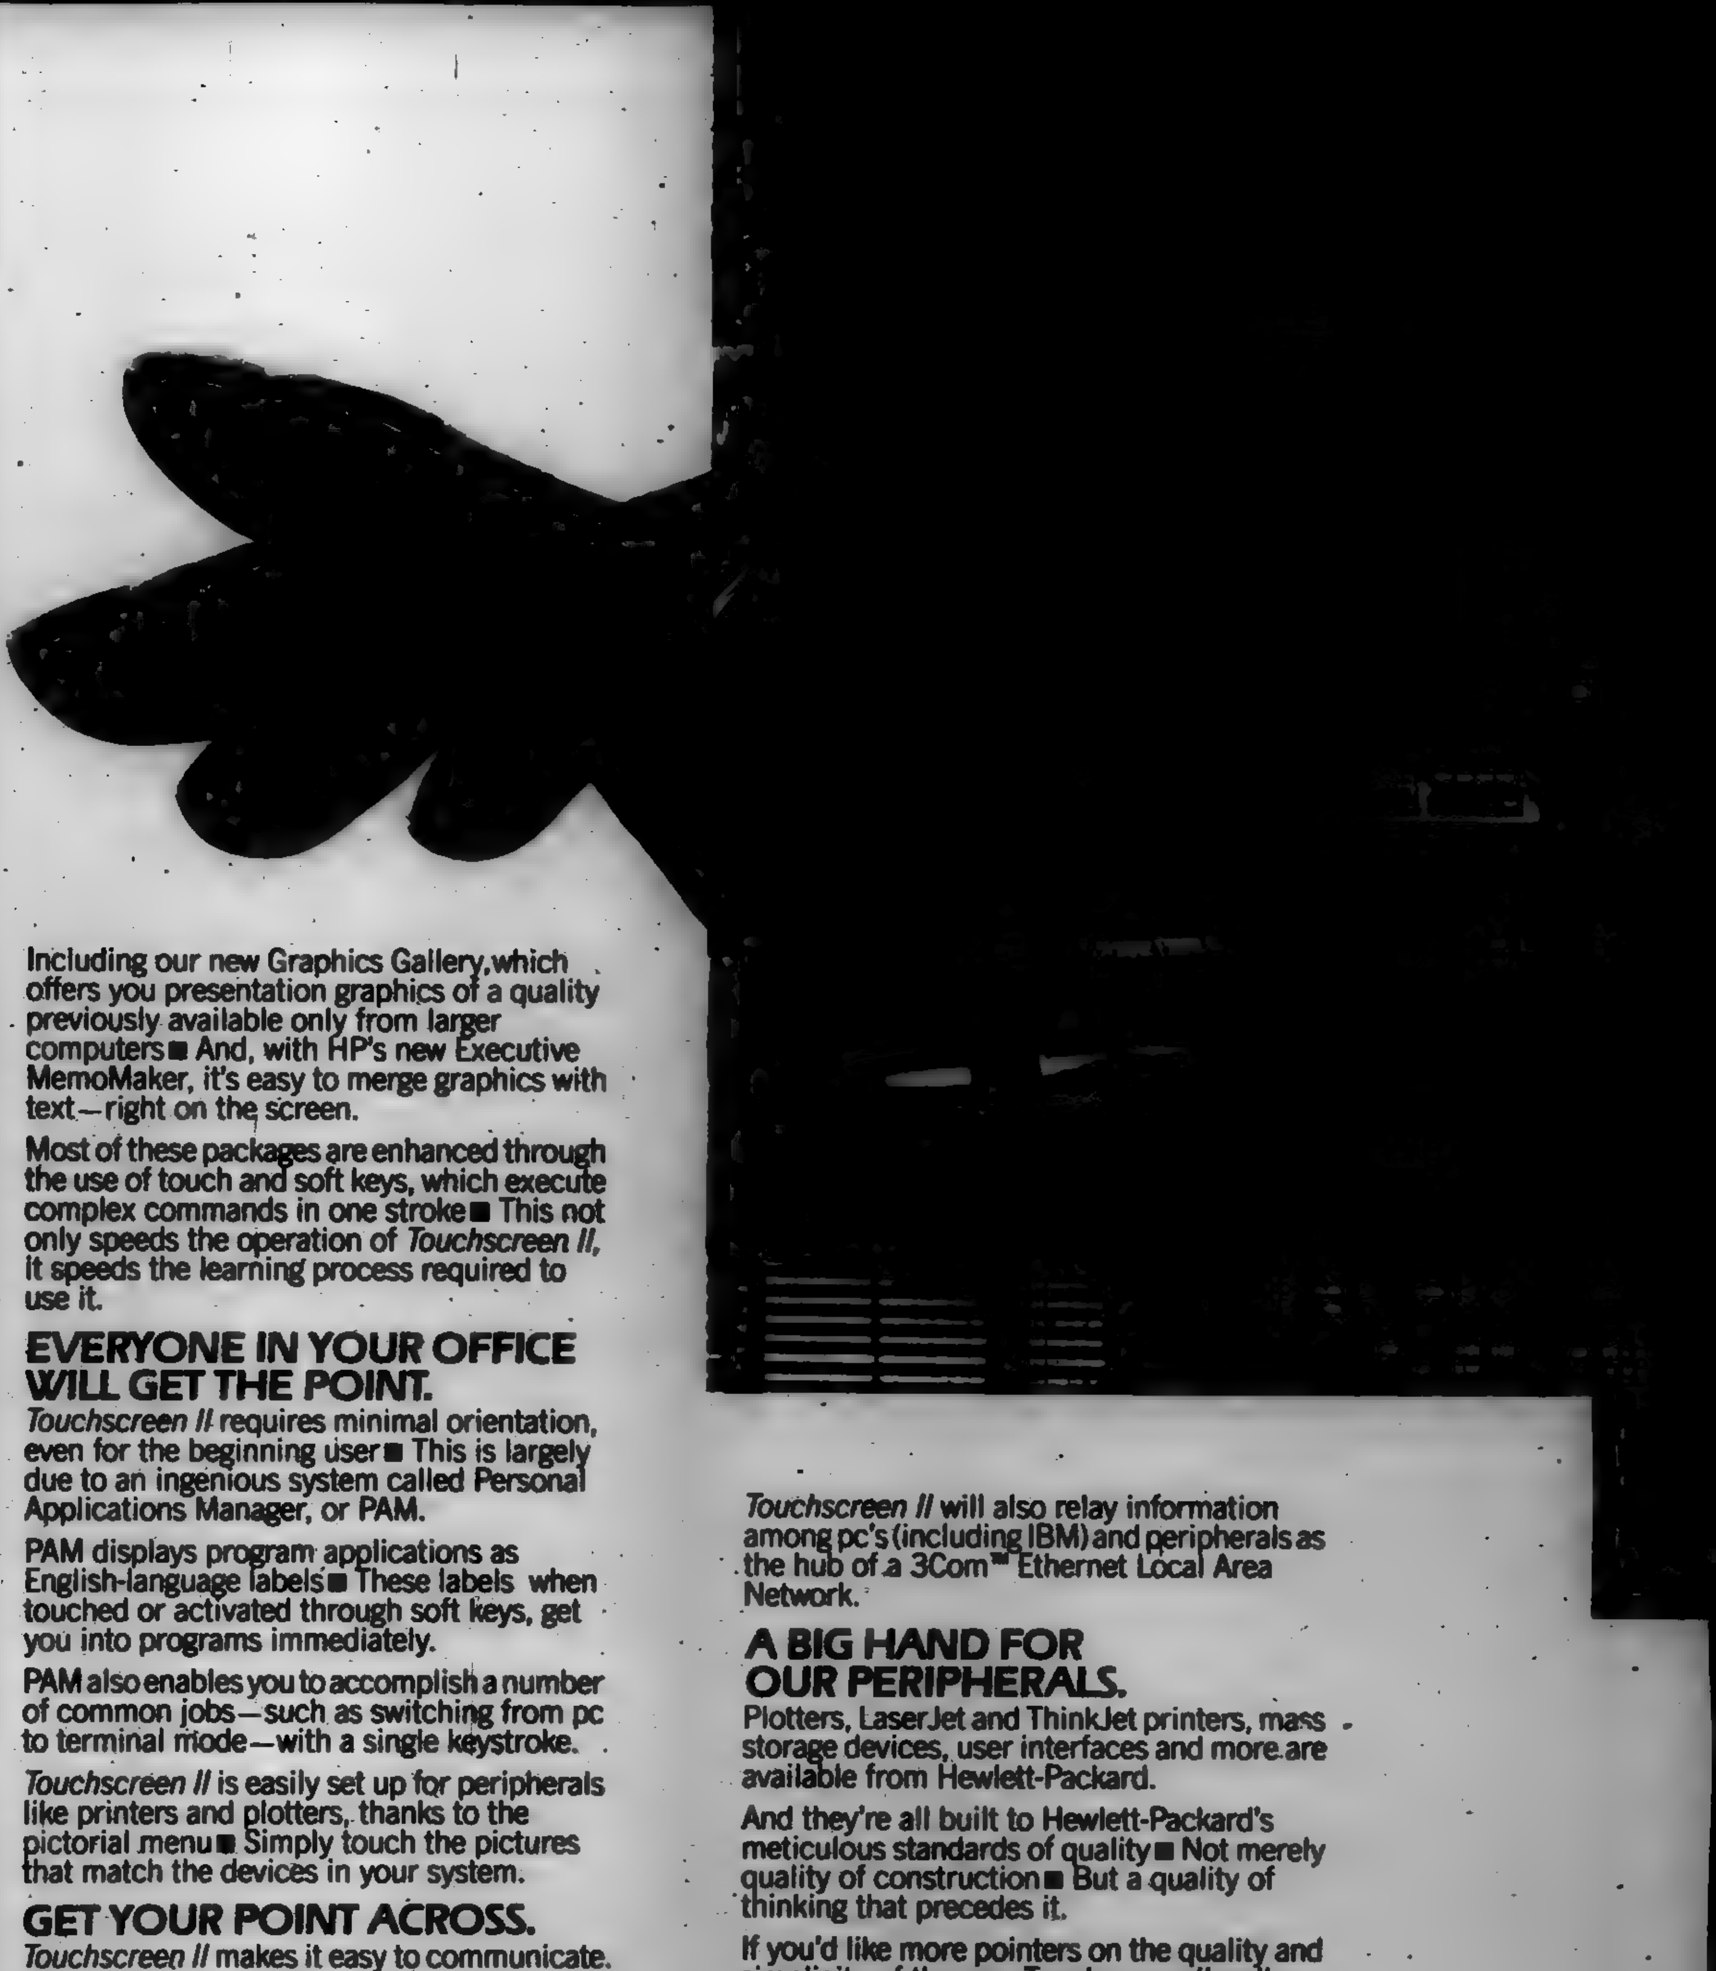
Sit down to work, and *Touchscreen II* displays a selection of application software on a high-resolution 12-inch screen.

Find the one you want to use, then touch the point on the screen where it appears■ Instantly, the program is activated.

You're freed from typing complicated gibberish commands■ Simply look, touch, and move on.

THERE'S PLENTY TO POINT TO.

Touchscreen II allows you to choose from over 600 of the most popular business software packages■ In addition, you can use Hewlett-Packard's own software library■



Including our new Graphics Gallery, which offers you presentation graphics of a quality previously available only from larger computers ■ And, with HP's new Executive MemoMaker, it's easy to merge graphics with text—right on the screen.

Most of these packages are enhanced through the use of touch and soft keys, which execute complex commands in one stroke ■ This not only speeds the operation of *Touchscreen II,* it speeds the learning process required to use it.

EVERYONE IN YOUR OFFICE WILL GET THE POINT.

Touchscreen II requires minimal orientation, even for the beginning user ■ This is largely due to an ingenious system called Personal Applications Manager, or PAM.

PAM displays program applications as English-language labels ■ These labels when touched or activated through soft keys, get you into programs immediately.

PAM also enables you to accomplish a number of common jobs—such as switching from pc to terminal mode—with a single keystroke.

Touchscreen II is easily set up for peripherals like printers and plotters, thanks to the pictorial menu ■ Simply touch the pictures that match the devices in your system.

GET YOUR POINT ACROSS.

Touchscreen II makes it easy to communicate.

Built-in terminal capabilities and a variety of data communication devices allow *Touchscreen II* to exchange information with Hewlett-Packard, DEC and IBM host computers ■ Acting as a terminal, *Touchscreen II* enables you to tap into the power of these larger computers; making use of their software, databases and peripherals.

Touchscreen II will also relay information among pc's (including IBM) and peripherals as the hub of a 3Com™ Ethernet Local Area Network.

A BIG HAND FOR OUR PERIPHERALS.

Plotters, LaserJet and ThinkJet printers, mass storage devices, user interfaces and more are available from Hewlett-Packard.

And they're all built to Hewlett-Packard's meticulous standards of quality ■ Not merely quality of construction ■ But a quality of thinking that precedes it.

If you'd like more pointers on the quality and simplicity of the new *Touchscreen II,* call us toll-free at 1-800-FOR-HPPC, Dept. 282A, for the name of your nearest Hewlett-Packard dealer or sales office.

The more you simplify, the more you'll produce ■ And productivity is, after all, the point of this discussion.

3Com™ is a U.S. trademark of 3Com Corporation.

HEWLETT PACKARD

Team-Up offers manager for network applications

JACKSONVILLE, Fla. — Unlimited Processing, Inc. has unveiled Total Environment for Application Management from Unlimited Processing (Team-Up), an applications management package that runs on 3Com Corp. and Novell, Inc. local-area networks.

The product supports up to 32,000 applications, containing as many as 700,000 files, and tracks file existence, file names, server and file locations and user access authorization, the vendor said.

Team-Up also supplies application generation capabilities that enable a user to create data entry screens by entering information on a screen.

Team-Up reportedly enables a user to read, write, enter, update and delete records referenced in up to 255 data bases by pressing a single key. The package maintains free record space and index files so a user does not have to reindex or sort files.

A single-user version of Team-Up costs $795, and a multiuser version of the program for an unlimited number of users sells for $1,795.

Unlimited Processing is located in Suite 8, 8382 Baymeadows Road, Jacksonville, Fla. 32216.

Natural Microsystems adds telemarketing software

NATICK, Mass. — Natural Microsystems Corp. has introduced a voice information system software package that reportedly adds voice-based telemarketing capabilities to IBM Personal Computers or compatibles with 256K bytes of memory and a Winchester disk drive.

Watson Voice Information System (VIS) is used with Natural Microsystems' Watson integrated voice and data system. Watson converts voice signals into information that can be stored on a computer disk. The computer is then able to access voice files in the same method it accesses computerized data, according to the vendor.

Watson VIS allows companies to define a level of information that the caller can access by pressing a button on a Touch-Tone phone. The product can also be used to dial lists of phone numbers and conduct a dialogue for those who press Touch-Tone responses. Users can load up to 500 phone numbers from the disk to the Watson outgoing call file, a spokesman said.

The voice information system costs $296.

Natural Microsystems is located at 6 Mercer Road, Natick, Mass. 01760.

INTECH '85. THE ONE CONFERENCE CORPORATE AMERICA IS COMING TO!

The focus of INTECH is information: How to use it, move it, manage it, and protect it.

INTECH '85 is the only conference and exposition in the information industry to offer the unique "SOLUTIONS APPROACH." Five in-depth conferences in one national forum—

Address the critical issues:

- Integrating Personal Computers
- Networks
- Information Security
- Managing the Technology
- Integrated Voice and Data

Solve your specific problems through:

- User Case Studies
- Problem-Solving Workshops
- Hands-On Demonstrations on the Exhibit Floor
- Informal Discussion Groups
- Exhibitor Product Briefings

ONLY AT INTECH— THE INTECH APPLICATIONS CENTER

Actual solutions and applications will be demonstrated on the exhibit floor by major industry vendors, corporate users, and user groups. PCs will be networked with LANs. Voice will be integrated with data. Micros will be linked to mainframes. And more!

If you have an innovative business application you would like to demonstrate, check the appropriate box on the coupon.

NETWORK USERS ASSOCIATION CO-SPONSORS INTECH '85

NUA, the powerful and influential users' organization, supports and endorses INTECH, the forum for its annual international meeting.

THE INFORMATION TECHNOLOGY CONFERENCE FOR CORPORATE AMERICA

YOU SHOULD ATTEND INTECH '85!

Directors of MIS, DP, OA, and telecommunications . . . vice presidents of operations, finance, and communications . . . professionals, executives, managers, and department heads . . . **INTECH is tailored for you.**

INTECH is held annually in San Francisco. For more information call **800-638-8510.** In Metropolitan Washington, D.C., **703-683-8500.**

Or return the coupon to:

INTECH '85,
National Trade Productions, Inc.,
2111 Eisenhower Avenue, Suite 400,
Alexandria, Virginia, 22314

Please rush me more information on INTECH '85:

CONFERENCE: AUGUST 26-29 • EXPOSITION: AUGUST 27-29

Dataflex out for computers under Xenix

MIAMI — Data Access Corp. has released a version of its Dataflex Application Development Data Base for the IBM Personal Computer AT under PC Xenix and on the Molecular Computer Model 12 system under Xenix.

Dataflex, which costs $1,250, is an application development and relational data base management system. Applications created with Dataflex are said to support up to 250 data files with more than 16 million records per file.

The product reportedly includes command language for program development, applications generators for data entry screens and reports, a compiler and a multifile interactive query for creating reports, labels and data files from data base information.

The package requires a minimum of 384K bytes of memory.

More information can be obtained from Data Access, 8525 S.W. 129th Terrace, Miami, Fla. 33156.

Datran unveils modem card

LOS ANGELES — Datran Corp. has announced a Modem Accelerator card for the IBM Personal Computer, Personal Computer XT and AT that reportedly improves telecommunications speed.

The Modem Accelerator is said to be compatible with most modems and software capable of sending binary files. The product compresses English-language text and other Ascii data to allow files to be stored in less disk space, the vendor said.

The card is also said to function as a spelling checker, processing 500 word/sec., with a dictionary of 30,000 words and phrases.

The card reportedly compresses data at 20,000 bit/sec. and decompresses data at 60,000 bit/sec.

The card costs $795.

Datran is located at 10519 Lauriston Ave., Los Angeles, Calif. 90064.

SPECIAL REPORT

DBMS

In the June 24th Computerworld Special Report we'll examine Data Base Management Systems (DBMS). This will include discussions of: market trends; corporate uses for microcomputer data bases; the increased use of multiple data bases; vendors' efforts to integrate applications around a central DBMS; and various issues concerning the purchase and maintenance of corporate data bases — such as corporate data base security, and how to evaluate and select a DBMS.

Fully 79% of Computerworld's subscribers at user organizations are personally involved in purchasing DBMS software for their company.

So if you sell DBMS or related products, tell Computerworld's 687,000 readers in the June 24th issue. Simply fill out the coupon below and return it today to reserve space for your ad. Or call Ed Marecki, National Sales Director, at (617) 879-0700.

Advertising close: June 7

☐ Yes, I want to reach active buyers of DBMS and related products. Please reserve space for my ad in the June 24th Computerworld Special Report.

☐ I'd like information about Computerworld's upcoming Special Reports. Please send me Rate Card No. 20.

☐ Please have a sales representative call me.

Migent's Ad-Lib applications generator for IBM micros bows

SCOTTSDALE, Ariz. — Migent Software, Inc. has announced it will release Ad-Lib, a $496 applications generator software product that incorporates relational data base management, file management and tables generation features, for IBM microcomputers and compatibles.

The vendor said Ad-Lib uses artificial intelligence techniques to allow end users to develop custom applications without programming because of a proprietary language for forms processing, called Formage, and a Micro Application Painter.

The forms-oriented software enables the user to paint the screen with a customized business form ready for data entry and automatically names and defines the fields.

Examples of applications include general ledger, payroll, amortization schedules, order entry forms, spreadsheets and accounts receivable, the company said.

Ad-Lib runs on the IBM Personal Computer, Personal Computer XT and compatibles with a minimum of 256K bytes of random-access memory. Ad-Lib will be released this summer.

Migent is located at Suite 203, 8300 N. Hayden Road, Scottsdale, Ariz. 85258.

Report evaluates micro communications offerings

CHERRY HILL, N.J. — Data Decisions, Inc. has announced "PC Communications," a three-volume report that covers a number of microcomputer communications products.

The report evaluates hardware and software products, including products that link microcomputers to mainframes, minicomputers, data services and other personal computers.

"PC Communications" is divided into five sections. Product evaluations list product strengths and weaknesses and group products into novice, experienced and technical user categories.

A rating summaries section lists Data Decisions' test results of similar products. The technical reports section examines and discusses issues such as security measures and vendor strategies.

The product profiles section groups similar products. The last section is a directory of vendors of micro communications products.

The report will be updated each month. A one-year subscription costs $800.

Data Decisions is located at 20 Brace Road, Cherry Hill, N.J. 08034.

SOFTWARE

■ Autodesk, Inc. has announced Version 2.1 of its Autocad drafting package, which runs under Microsoft Corp.'s MS-DOS and IBM's PC-DOS operating systems.

Version 2.1 features an increase in execution speed of up to 40%, optimized plotting of drawing and support for dot matrix and laser printers.

The visualization capability included in Advanced Drafting Extensions 3 (ADE 3) is a step toward providing three-dimensional capability for Autocad, a spokesman said.

Wire-frame drawings can be viewed and plotted and lines obscured by other objects in a 3-D drawing can be visually suppressed from displays and plots to provide a realistic 3-D image of solid objects.

ADE 3 also contains the ability to create and edit polylines — a series of connected-line or arc segments, or a combination of the two, that can have widths or line types associated with it — to provide for constructing, editing and dimensioning of smooth curves.

Autocad Version 2.1 has three configurations: The basic drafting package costs $1,000; Autocad with ADE 2 costs $2,000; and Autocad with ADE 2 and ADE 3 costs $2,500.

Autodesk, 2320 Marinship Way, Sausalito, Calif. 94965.

■ Dialogic Corp. has announced the Dialogic Voice Toolbox, a set of software tools that allows systems developers to create end-user voice systems for the IBM Personal Computer, Personal Computer XT and AT.

The Voice Toolbox consists of five modules. Vbase allows users to create, edit and manage a data base of words and phrases, Callstat monitors phone line status, Dialogic Intelligent Modem Emulator (Dime) can emulate Hayes Microcomputer Products, Inc. modems and Dostools can create an applications package using voice I/O. Sptools signal processing routines that allow the user to condition signals on a voice file.

Dime and Callstat require Dialogic's Dialog/2 and Dialog/3 voice systems. The entire Voice Toolbox is priced at $150. Individual modules cost $50 each.

Dialogic, 60 Baldwin Road, Parsippany, N.J., 07054.

NOW IT ONLY TAKES ONE TO TANGO.

Say hello to PhoneMail™ and say hello to the One Party Phone Call. No more waiting for the phone to ring, waiting for someone on the other end, waiting for your telephone partner in another city, another meeting, another time zone. Waiting.

PhoneMail is not your basic phone answering gadget.

It's a digital voice-messaging system for your entire company that you can access from any Touch Tone* telephone anywhere in the world, any time.

PhoneMail can answer your phone with your personal greeting. (If you'd prefer, your secretary can take the call and direct the caller to PhoneMail.)

It will let you answer messages automatically. It can forward them, along with your comments, to dozens of your associates. It lets you send messages to a whole roster of

SOFTWARE

from page 46

■ **Lattice, Inc. has announced software that reportedly allows C language programmers to take advantage of the IBM Topview multitasking window environment.**

The Lattice Topview Toolbasket is said to be a library of more than 70 C functions to control window, cursor and pointer operations. It also reportedly includes printer control, cut-and-paste and debugging functions.

The product requires a minimum of 256K bytes of memory (with 512K bytes recommended) on the IBM Personal Computer, Personal Computer XT and AT.

Lattice Topview Toolbasket is priced at $250, and source code is available for an additional $250.

Lattice, P.O. Box 3072, Glen Ellyn, Ill. 60138.

■ **Modern Technologies International, Inc. has introduced a menu driver, file directory manager, file router and IBM PC-DOS interface utility for the IBM Personal Computer XT, AT and compatibles.**

The package, Hard Desk, reportedly provides the user with a set of English commands that can be addressed by function keys to integrate up to 10 software packages in a single menu system. The product requires 4K bytes of random-access memory and can access programs that reside in a combination of directories through a single menu. Function keys provide access to PC-DOS, on-line Help facilities, file routing and batch commands.

Hard Desk can be used with a number of applications packages, including Micropro International Corp.'s Wordstar, Microsoft Corp.'s Multiplan and Lotus Development Corp.'s 1-2-3. Hard Desk costs $95.

Modern Technologies International, Suite 302, 656 Bair Island Road, Redwood City, Calif. 94063.

■ **Softool Corp. has announced that its Fortran Programming Environment (FPE) is now available on the IBM Personal Computer, Personal Computer XT, AT and compatibles.**

Formerly available only on minicomputers and mainframes, FPE's programmer productivity tools include structured languages, a source code documenter, interface documenter, error detectors, libraries of prefabricated code, testing aides, tracing aids, optimizers and communications software. Called FPE/PC, it is said to enable programmers to compose portions of an application program from existing code and automates Fortran programming tasks.

FPE/PC allows the user to move Fortran applications from a mini or mainframe to the micro for development of micro applications and to off-load Fortran development work from a mainframe or mini to a micro.

FPT/PC is priced at $1,495.

Softool, 340 S. Kellogg Ave., Goleta, Calif. 93117.

■ **Thoughtware, Inc. has announced a knowledge-based software package said to help managers to manage people effectively.**

The Management Advantage package runs on the IBM Personal Computer, Personal Computer XT, AT and compatibles. It is said to contain advice distilled from practical management experience.

Management Advantage requires a minimum of 256K bytes of memory and IBM's PC-DOS 2.0 or higher.

The package costs $249.

Thoughtware, Suite 1000A, 2699 S. Bayshore Drive, Coconut Grove, Fla. 33133.

■ **Aurotech, Inc. has released an integrated security package for the Lotus Development Corp. 1-2-3 spreadsheet product running on IBM's Personal Computer, Personal Computer XT and AT.**

The package, Sheetguard, is said to permit only authorized users to share the 1-2-3 data.

Sheetguard is said to be activated whenever 1-2-3 is in operation. The program uses Aurotech's proprietary encryption method to scramble the data as it is being saved. The spreadsheet is retrieved by using a password.

The program costs $79.95.

Aurotech, Suite 100, 925 S. Niagara, Denver, Colo. 80224.

■ **Fox & Geller, Inc. released its Quickindex indexing software for users of Ashton-Tate's Dbase II and Dbase III packages on IBM Personal Computers and compatible systems.**

Quickindex is said to produce Dbase-compatible index files up to 10 times faster than Dbase does. A 2,000-record data base with a key size of 10 can be indexed in 1¼ minutes, the vendor said.

The package costs $69 for a copy-protected version and $99 for a non-protected version.

Fox & Geller, 604 Market St., Elmwood Park, N.J. 07407.

■ **The MacNeal-Schwendler Corp. has unwrapped an upgrade to its finite element analysis software package for the IBM Personal Computer XT, AT and compatibles.**

The MSC/Pal2 package is designed for use by mechanical engineers and designers in small and medium-size companies, the vendor said. It is an upgraded version of MSC/Pal that runs on the IBM Personal Computer.

The package adds elements including quadrilateral plates, shear panels and curved beams to mechanical systems. Other functions include additional applied load capabilities, enhanced graphics and the ability to handle larger, more accurate three-dimensional models, the vendor said.

Features include automatic nodal

folks. So you can forget about publishing reams of short memos. Its voice prompts guide you step by step. So there's no chance for miscommunication. Problems are solved. Decisions are moved along.

It works wonders with most any business telephone system. It'll cater to forty folks or a thousand — simply, swiftly, cost-effectively.

Of course, only ROLM has PhoneMail. That's not surprising. We're the folks who taught telephones and computers and people how to work together. We can show you the most advanced ways to manage voice and data today, next year and into the next century.

If your business phone system has you talking to yourself, it's time to talk to ROLM.

ROLM
an IBM company

800-538-8154. (In Alaska, California and Hawaii, call 408-986-3025.)

Continued from page 47

resequencing, multiple-loading subcases, cylindrical and spherical coordinate systems and generation commands for handling element, node point and boundary condition.

The MSC/Pal2 package runs under IBM's PC-DOS 2.0 or higher and requires 512K bytes of memory, a floppy drive and a hard disk, a color graphics controller and a math coprocessor, the vendor said.

The package costs $1,995 and will be available in July.

MacNeal-Schwendler, 815 Colorado Blvd., Los Angeles, Calif. 90041.

■ Micro Data Base Systems, Inc. has announced a version of Knowledgeman, its integrated package, that runs on Novell, Inc.'s local-area network.

Knowledgeman's functions include a relational data base management package, a spreadsheet and a programming language. Optional modules include forms painting, graphics, text processing, report generator and support for a mouse.

The local-area network product version features protection of shared records or tables, automatic hold processing when a user is browsing through a table and automatic index updating for shared tables.

Other functions are automatic suspension and resumption of shared table modifications, choice between shared and local status for each table and the ability to modify a completed table's status and limit user Read or Write access of specific tables. Password security and data encryption are supported.

A 10-user version of the product costs $1,495.

Micro Data Base Systems, P.O. Box 248, Lafayette, Ind. 47902.

■ Enertronics Research, Inc. has announced a version of Energraphics, a graphics package that runs on Texas Instruments, Inc.'s Professional microcomputer.

The package reportedly works with nine fonts and produces pie charts, line charts and three-dimensional bar charts. A pie chart can be sliced into 15 portions, and the software can list each portion's percentage of the whole and can enlarge a portion. Line charts feature up to 10 lines per chart, up to 200 data points per line, scatter graphs, curve fitting, log scaling and up to four Y scales. Bar charts support up to 24 data ranges, 10 graphs per chart and horizontal or vertical plotting.

The package enables a user to define up to 2,280 symbols and store and recall them with one keystroke. It can input files from Lotus Development Corp.'s 1-2-3, Microsoft Corp.'s Multiplan and other packages that use Data Interchange Format files.

Energraphics costs $350. Plotter drivers are available for an additional $100.

Enertronics Research, Suite 207, 150 N. Meramec St., St. Louis, Mo. 63105.

■ PC Software Interest Group has announced Edit, a public domain word processing package that runs on an IBM Personal Computer.

With the package, a user can move a cursor by character, word, line, sentence, paragraph, screen or indentation. The product supports block saving, moving, insertion and deletion. Edit provides search forward or backward, global search and replace and conditional replace functions.

A user can set tabs, margins, page layout, headers, footers, page numbers, justification and spacing. Edit supplies Help screens that explain different options.

The product runs on an IBM Personal Computer with 128K bytes of random-access memory and IBM's PC-DOS 2.0 operating system.

Suggested donation for Edit is $25.

PC Software Interest Group, Suite J, 1030 E. Duane Road, Sunnyvale, Calif. 94086.

■ Software Research Associates has announced a version of its program testing software for Microfocus Ltd. Cobol programs written on the IBM Personal Computer.

Test Coverage Analysis Tool (Tcat/Cobol) is said to help the programmer identify which parts of the code remain untested.

Tcat/Cobol reportedly consists of a Cobol language instrumenter, a run-time program to collect test coverage data and write trace files and a coverage analyzer that produces the coverage numbers. The software also includes utilities for manipulation of trace files, a trace file archiving facility and on-line Help frames.

Tcat/Cobol requires an IBM Personal Computer running PC-DOS 2.0 or later and 64K bytes of memory.

The software costs $2,500 for a single CPU license and $9,000 for a license for all machines at one site.

Software Research Associates, 580 Market St., San Francisco, Calif. 94126.

■ Wordtech Systems, Inc. has unveiled a compiler that reportedly converts programs written in Ashton-Tate Dbase III to code that can run on any micro using Microsoft Corp. MS-DOS with 192K bytes of random-access memory (RAM).

Db III Compiler reportedly compiles programs written in the Dbase III language into a form that will execute without either Dbase III or Ashton-Tate's Runtime. The compiled program is said to be compatible with both Dbase II and Dbase III data files.

The product is said to eliminate the Dbase III system requirements for an IBM Personal Computer with 256K bytes of RAM.

Db III Compiler costs $750. The upgrade cost from Wordtech Db Compiler for Dbase III is $250.

Wordtech Systems, P.O. Box 1747, Orinda, Calif. 94563.

COMPAQ could have stopped here

GEM from page 37

network would look like."

Knutson said it is easy to find graphics packages for producing pie charts and bar charts but difficult to find programs that allow users to merge text and graphics. "That's what was so great about Apple's Macintosh and Lisa computers," said Knutson, who has also used the Lisa to produce charts.

Knutson said he "jumped at the chance to use Gem Draw" when it was introduced. Now, he recommends the program to fellow workers, he said.

Knutson likes the immediate feedback of Gem Draw, he said. Instead of having to wait for several weeks while a Boeing graphics group produced hand-drawn charts, Knutson can now create his own.

Equally important, he said, is the fact that the charts can be easily altered with Gem Draw. "And if you've ever worked with engineers, you know they like to make changes," he said jokingly.

Virginia Martin, a staff engineer in the data systems division at Hughes Aircraft Co. in Fullerton, Calif., said she wanted to be able to provide users with the same graphics capabilities as the Macintosh without buying Apple's computer. Hughes Aircraft has already settled on the IBM Personal Computer as its standard system, she said.

In addition, the company wanted a package that would work with IBM's enhanced graphics board and monochrome monitors. "We didn't want to have to replace all our monitors with color monitors," she explained. Gem Draw, she found, fit the firm's requirements.

Bert Trerise, a senior scientist in Hughes Aircraft's data systems division, is using Gem Draw to produce view graphs for overhead presentations. In general, he gave the package a positive review, saying it produced satisfactory graphics on his dot matrix printer. But the program does have some shortcomings, he said.

Trerise said he has encountered problems in trying to center a block of text within a box. Although the text will appear centered on the screen, it is not centered when it is printed out, he said. "It's a hit-or-miss process," Trerise said. "And I haven't figured out a rule of thumb that would let me get close the first time," he added.

According to a Digital Research spokesman, users will be able to center text within a box if they are working in the Portrait (vertical) mode. In Landscape (horizontal) mode, however, users will have to experiment with the output to gauge the center of the box.

Despite this problem, Trerise said he would encourage others to try Gem Draw. "In my usage, the fonts it produces on the printer are clear, just right for view graphs," he said.

As a whole, the users gave Digital Research high marks for Gem Draw's menu-driven installation procedure. No knowledge of IBM PC-DOS commands is required to install the program, they said.

The users had some suggestions for improving Gem Draw. Citibank's Kalipetes said he would like Digital Research to provide a set of flowchart symbols with the program. In addition, the users recommended that the firm increase the variety of fonts and provide the ability to rotate objects.

...but we didn't.

Introducing the new COMPAQ PORTABLE 286.™
More features, more speed...more useful.

Most people think the IBM® Personal Computer-AT™ can do more than any other personal computer. But now COMPAQ® offers a personal computer that does more in a package *half* the size, complete with a handle.

Incredibly fast

Most computer companies would consider it a breakthrough to make a computer with the power and speed of the IBM PC-AT. But not COMPAQ. The new COMPAQ PORTABLE 286 runs all the popular programs 30% *faster.*

And no doubt most would have been elated to put 20 Megabytes of fixed disk storage in a portable computer. But we didn't stop there. We designed the COMPAQ PORTABLE 286 to accept an internal fixed disk drive back-up system as well. It protects your data on pocket-sized tape cartridges, something not even the IBM PC-AT can do.

Room to grow

Once we got started, it was hard to stop.

There's room for up to three internal storage devices. Choose from 1.2-Megabyte or 360-K byte diskette drives, the fixed disk drive and fixed disk drive back-up.

Add up to 640-K bytes of memory on the main board. Then add up to 2 more Megabytes using an expansion board. That gives you more memory than most desktop computers.

For displaying your work, a built-in monitor shows high-resolution text *and* graphics. A second monitor isn't necessary.

Does more—anywhere

Together, all these features add up to our fastest, most powerful portable computer. It helps you do more, in more places.

Of course, if you need a computer with even more power, we designed a model that stays in one place.

The new COMPAQ DESKPRO 286™. With up to 8.2 Megabytes of memory and 70 Megabytes of storage, it can take you beyond today's limits of desktop personal computing.

COMPAQ offers personal computers beyond compare. Because we make them without compromise.

For a free brochure or the location of your nearest Authorized COMPAQ Computer Dealer, call toll-free 1-800-231-0900 and ask for operator 6.

COMPAQ
PORTABLE 286™

It simply works better.

AI from page 37

(such as Lisp and Prolog compilers) become available, personal computers are becoming subversive once again. They're beginning to join the AI parade as prototyping, development, delivery and training vehicles.

In one of the first steps, micros built around the Intel Corp. 80286 or Motorola, Inc. 68000 family may be perfectly appropriate for building and running small knowledge-based systems.

And, as in the case of early micro software packages, those knowledge-based systems will not necessarily be written by computer professionals.

Neil Pessall, an advisory scientist with Westinghouse Research and Development in Pittsburgh, has written several expert systems in conjunction with another materials specialist, using Texas Instruments, Inc.'s Personal Consultant software.

That approach "is a violation of the AI field," he acknowledged. But it has worked well, and he disagrees entirely with the theory that "expert systems should not be developed by experts."

DOS from page 37

editor and a print manager also are bundled in with the operating system.

Additionally, Digital Research is offering OEM versions of Concurrent DOS 86, which include local-area networking support provided by the company's DR Net. Digital Research intends to provide IBM PC Network compatibility by the year's end, Loftus said.

Concurrent DOS 86's multitasking design is said to feature a flexible, priority-driven architecture rather than a time-sliced CPU setup such as that provided by IBM's Topview operating environment. The software takes up 165K bytes of internal memory.

Concurrent PC DOS will be repriced at $295 in August, Digital Research said.

The product runs on the IBM Personal Computer, Personal Computer XT, Personal Computer AT and compatible systems. The software requires a minimum of 256K bytes of memory and two floppy disk drives; 512K bytes and a hard disk drive are recommended.

More information is available from Digital Research at Box DRI, 60 Garden Court, Monterey, Calif. 93942.

WHAT MAKES US THINK WE CAN SPEAK FOR EVERYBODY?

VOICE MANAGEMENT OFFERS OVER 150 CALLING FEATURES TO CUSTOM-TAILOR EACH VOICE TERMINAL. IT'S ONE OF MANY INTEGRATED FUNCTIONS OF AT&T SYSTEM 85 AND AT&T SYSTEM 75.

The telephone. We depend on it like nothing else in our lives. Since we were old enough to form a complete sentence, hardly a day has gone by without our having used it. We take it for granted. We slam it around. It has entered our language as an idiom for ease of use and reliability. "It's just a phone call away." "It's as easy as making a phone call."

AT&T's legacy of superiority in voice communications is being passed on to the next generation. You'll find it in the Voice Management function of System 85 and System 75 from AT&T Information Systems—the most powerful, most flexible communications systems in the world.

THE LAST WORD IN VOICE

Our voice terminals set the industry standard for reliability, diversity and flexibility. We offer the widest selection available, and they're modular in design, so you can add new features as your needs increase.

One such feature is our optional 40-character display module. It tells you the name and number of a caller before you answer. With this information, you can screen your own calls while you're in your office, electing either to answer them or send them to a coverage point.

We also offer over 150 calling features which you can assign as you see fit. So each phone is custom-tailored to the needs of its user. Abbreviated Dialing, Call Forwarding, and Automatic Callback are just a few of the features that can save you time and make your systems easier to use.

Making sure the phone works is one thing. But how do you make sure it gets answered? Enter our Call Coverage and Leave Word Calling features. Your phone can be answered and messages taken, even when you're not around.

For call intensive businesses, we have Uniform Call Distribution. It directs incoming calls to the first available agent. So you can handle more calls in a shorter period of time. That's good for you and your customers.

Whatever your needs, from conference calling to simultaneous voice and data transmission, System 85 and System 75 are sure to get the job done.

100 YEARS OF COMMUNICATIONS EXPERIENCE

Our experience in voice communications speaks for itself. We've been the undisputed leader for over 100 years, and we're dedicated to keeping it that way. More than 4000 scientists and engineers formerly at AT&T Bell Laboratories are now working at AT&T Information Systems Laboratories developing systems that integrate voice and data to help your business operate more efficiently.

To further protect your investment, our Information Systems Architecture ensures that any upgrades or future generations of your system will be compatible with the current one.

How can you make sure your business is operating with the best voice communications system available anywhere in the world? It's as easy as making a phone call. Call your AT&T Information Systems Account Executive or 1-800-247-1212, and ask about System 85 and System 75.

AT&T
The right choice.

© 1985 AT&T Information Systems

Keep your nodes running.

Introducing the most Compact Communications Switching System that Connects, Detects and Corrects both Digital and Analog Circuits at remote sites, from One Central Station.

The Data Switch Model 2810 does something wonderful for decentralized networks. It centralizes control.

It also eliminates downtime during scheduled or unscheduled changes.

The Model 2810 supports more RS-232, V.35 and analog circuits — all at full speed — than any other compact Matrix Switching System.

Because of our switching technology, the Model 2810 does not require segmentation of the matrix to support analog lines, so there is no trade off in number of lines or line speed.

This makes it easy to upgrade your system and maintain availability and reliability of all lines — all at full speed.

When you detect a problem, the Model 2810 allows you to spare front-end processors, lines and modems — from the central site.

In addition, this "remote technician" lets you test analog and high- and low-speed digital circuits and devices at remote sites — from the central site. You can even vary the dB gain or loss in an analog circuit from afar.

All of this lets you optimize communications within your network and can minimize communications costs.

Keep your nodes running. Ask about our new Model 2810.

Numbers add to net hassles

Anyone who has been frustrated by trying to bring up a new data line that does not work on the first try is aware of the resultant finger-pointing that occurs between the systems people, the modem supplier and the carrier. Multivendor networks and AT&T divestiture have made it much harder to pin the blame on one particular vendor.

For example, follow a byte of information leaving an IBM front-end processor through a T-Bar, Inc. matrix switch, which feeds an AT&T Information Systems modem connected to a Nynex Corp. line via an Arus Corp. bridge, to AT&T Communications long-haul facilities employing Rockwell International Corp. digital microwave equipment. From here, the byte travels to the Pacific Bell area, where a Paradyne Corp. modem-sharing unit is connected to a modem supporting an ADP Network Services, Inc. controller that emulates an IBM 3274 communications controller to support terminals from GTE Corp.'s Financial Services Division and Teletype Corp. printers.

This is not an academic concoction; it is a typical business network.

It is amazing that such a complex machine would work at all, but it does. The credit for this end-to-end compatibility goes to the integrity of the communications industry as a whole. But the communications manager is increasingly confronted with the challenging responsibility of making sure this multidimensional conundrum is reliable.

Network complexity can grow arithmetically and geometrically. As an example of the former, net complexity can

Network upgrades seen laying ground for ISDN

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — As a precursor to universal voice/data connectivity, the seven regional holding companies are rapidly installing metropolitan fiber-optic local loops and upgrading analog central office switches to digital.

The migration to these facilities is seen by analysts as preparation for Integrated Services Digital Network (ISDN), where customers will control their access to telephone utility for data, voice and image communications.

In 1984, the seven regional holding companies spent an average of $2 billion for basic network service improvements and have indicated plans to spend another $1 billion in 1985 in further network expansions and upgrades. Central to the telephone companies' strategies is keeping the largest revenue-producing customers on their networks and blocking any move to bypass.

In recent weeks, Bell Atlantic Corp., Nynex Corp., Ameritech and Bell South Corp. have all made announcements of services they call "links in the evolution to an ISDN." Some of these services are new features for its Centrex service.

Nynex, for example, recently introduced a family of Pathways services that will become available by the end of 1986 [CW, May 13]. Pathways includes Flexpath, a digital 1.5M bit/sec. or 64K bit/sec.

See NETWORK page 56

- Data Switch has announced a new model in its family of fiber-optic channel extenders that can reach up to 5 km/54

Salary gains trail budgets

By Paul Korzeniowski
CW Staff

DALLAS — Salaries of communications professionals are not keeping pace with the more rapid increases in corporate communications budgets.

Communications managers interviewed here recently at Telecom '85, a show sponsored by the International Communications Association, reported that equipment and service costs were fueling budget increases but salaries were remaining stable or increasing at a much slower rate.

Managers said their budgets had grown 10% to 30% in each of the last two years. Equipment purchases were listed as the primary stimulant for budget increases.

Regarding salary increases, a communications manager at an insurance company in Bloomington, Ill., said his budget went up 30%, but salaries increased by 10%. The insurance company's salary increases were the highest mention by managers in-

See SALARY page 55

Nynex to build net for DEC

WHITE PLAINS, N.Y. — Nynex Business Information Systems Co. will build two fiber-optic networks for Digital Equipment Corp. in Massachusetts and New Hampshire to link 21 DEC offices.

Nynex reported that retaining DEC as a corporate customer was one of the key factors in the decision to offer the minicomputer maker an alternative to the network capabilities of the Nynex telephone companies.

The networks will span 80 miles, link DEC voice switches and provide high-bandwidth data transmission facilities. The 90M bit/sec. backbone network has a purchase value of $4.6 million and will include fiber-optic cable, terminating hardware and lightwave equipment.

The first phase of the project should be completed in two years, according to the company.

Nynex Business Information Systems is located on the Second Floor, 65 W. Red Oak Lane, White Plains, N.Y. 10604.

How to make your computer room bigger by shrinking your modems.

Trade in your huge, old, ugly and under-featured 9.6 kpbs modems on sleek new AJ 9601 modems for only $1995.

We'll also give you a $500 trade-in* for your old working model.

At just over 2" high x 6" wide, you can fit up to 64 in a standard six foot rack and save valuable computer room space.

Use the same modem for standalone or rack mounting.

The AJ 9601 is a full duplex, synchronous modem that operates at 9.6 kbps over a four-wire dedicated circuit in point-to-point communications. It's V.29 compatible.

The AJ 9601's two-call autodial backup system can regain your connection over dialup lines should lease lines fail.

You also get a full array of front-panel controls softstrapped for easy set-up. With down-line loading and security that redirects control to a central site. Full diagnostics and self-testing assure reliability.

Act now. Offer ends July 25, 1985.

*Trade-ins must be V.29, 4-wire, PDX leased-line modems from end users.

AT&T's Vivid video teleconferencing system debuts

BERKELEY HEIGHTS, N.J. — AT&T has announced a digital switched video conferencing system for local, metropolitan-area networks.

The Vivid video teleconferencing system is said to offer broadcast-quality video service under customer control, enabling users to initate a video conference without operator assistance.

Vivid is said to provide voice communications and support data transmission at rates from 1,200 to 56K bit/sec., the vendor reported. Vivid will be provided over 200,000 miles of AT&T lightwave cable available in a number of locations throughout the U.S., although exact locations have not yet been disclosed.

The Vivid system includes the following:

- Digital Video Terminal, a coder/decoder that accepts video and analog data, such as facsimile and encodes, multiplexes and transmits the data in a DS3 signal at 45M bit/sec.
- A wide-band video switch, which is used to establish one-way, two-way, point-to-point or multipoint connections.
- A Customer Network Controller based on an AT&T 3B minicomputer that communicates to the switch and allows a customer to control a network.
- A Digital Switch Interface that converts a DS3 signal to a signal required at a switch.
- A Lightwave Video Interface, which is able to receive DS3 lightwave signals and converts them to electrical signals.
- A touch-sensitive control terminal for access to the video teleconferencing network.

The service should be available in the first quarter of 1986, and pricing is dependent on each installation.

AT&T is located at 1 Oak Way, Berkeley Heights, N.J. 07922.

Data Switch announces extenders

NORWALK, Conn. — Data Switch Corp. has announced a new model in its family of fiber-optic channel extenders.

The Model 8044 attaches a peripheral control unit to an IBM mainframe at distances up to 5 km at speeds up to 650K bit/sec. Controllers normally have to be located within 400 ft of one another and transmit data at speeds up to 43K bit/sec., the company reported.

The product consists of two channel extension units: one for a channel on the mainframe and one that attaches to a remote unit. Model 8044 does not require modification to the computer's operating system, applications software or access method. The product can supply redundant power supplies, central remote control panel and systems controller.

There are three models of the product: Model 8044-1 can be attached up to 2 km away and supports data transfers at speeds up to 50K bit/sec.; Model 8044-2 transmits data at speeds up to 250K bit/sec. and distances up to 5 km; Model 8044-3 supports transmissions at speeds up to 650K bit/sec. and distances up to 5 km.

Model 8044-1 costs $16,000 per link; Model 8044-2 costs $24,000 per link; and Model 8044-3 is priced at $32,000 per link.

Data Switch is located at 444 Westport Ave., Norwalk, Conn. 06851.

WHEN YOU INTEGRATE VOICE AND DATA SYSTEMS, WE CAN HELP YOU AVOID THE RISKS.

When it comes to integrating voice and data systems, one wrong step can prove disastrous. That's why it pays to have someone on your side who knows the ropes.
PacTel Communications Systems.

We took the time to evaluate all the available voice and data products so you won't have to. So while most voice and data suppliers sell you only the equipment they make, we set you up with the solutions you need.

We start by carrying only products designed with an Open Architecture, from such reputable manufacturers as Northern Telecom, Data General, Codex, Timeplex and C. Itoh.

Our rigorous evaluation ensures these products to be the most reliable, compatible and cost-efficient on the market today. Besides working with one another, they can

MINOLI

from page 53

follow the arithmetic sequence 1n, 2n, 3n and so on as modems are added to a network to support remote sites. It can also grow geometrically following the sequence, n, n squared, n cubed and so on, when directly addressable memory in a CPU grows with word length: 2^8 addresses, 2^{16} addresses, 2^{32} addresses and so forth.

Competition and divestiture have created an environment that exceeds both arithmetic and geometric complexity. We have been thrust into an exponentially complex world.

For example, there are 64 ways in which three vendors — A, B and C — can point the finger. These include the following: A says nothing, B says nothing, C says nothing; A says nothing, B says nothing, C says it's A's fault; A says nothing, B says it's A's fault, C says it's B's fault; A says it's B's and C's fault, B says it's C's fault, C says it's B's fault; A says it's B and C's fault, B says it's A and C's, C says it's A and B's fault . . .

You get the idea.

Few real-world networks would involve only three vendors. The network outlined at the top of this article specifies 14, and it is not unusual to have 20. In general, if there are n number of vendors, then there are "two to the power n times (n-1)" ways to point the finger.

Obviously, multivendor environments existed before divestiture. However, this situation has been aggravated by divestiture insofar that where once a single vendor provided end-to-end long-haul links, that same circuit must now be handled by four vendors: two local telephone companies, the long-haul carrier and the equipment supplier.

Given this, communications managers should strive to minimize the number of vendors involved with their networks. The orthodox (predivestiture) way a communications manager would approach network design would be to acquire the least expensive hardware solution, even if this meant comprising the "vendor-purity principle" by adding another vendor.

Prima facie, it would appear that the manager had done his job in minimizing network cost. In reality, however, the apparent savings would probably soon be lost in the meantime to repair equipment and associated business risks or lost revenue potential due to downtime.

Divestiture, with its intrinsic multivendor character, has accentuated the need to value reliability over apparent savings when implementing networks.

SALARY

from page 53

terviewed. "Salaries in my department have only slightly increased," said D. C. Augustin, director of telecommunications and network services at McDonnell Douglas Aerospace Information Services in St. Louis.

"Communications professionals' salaries have not kept pace with the additional skills required for the job," maintained Tony J. Gelardi of Computer Sciences in El Segundo, Calif. "But my department's salary increases have kept in line with those throughout the company."

This situation has created a problem for Gelardi. "There have been occasions where our company has served as a training ground," he said. "As soon as a person was fully trained, he went to work for another firm where he received more money."

Another area where salary levels hinder a manager is in hiring employees. All the managers claimed to have had problems finding communications professionals. "We looked for a new person for one year," explained Dennis E. Fielding, staff consultant at Harris Corp. in Melbourne, Fla. "We finally hired a college graduate who didn't have any experience."

Fielding did not, however, favor substantially increasing salaries to entice potential employees. "A manager can go out and buy an employee," he said, but "I doubt many managers want to get in a bidding war."

McDonnell Douglas' Augustin concluded, "Whenever there is an increasing demand in the market like there is today for telecommunications professionals, staffing can be a problem. Our turnover has been higher than I would like it to be, but there isn't much you can do when there just aren't enough qualified people."

also be integrated with most of the stand alone PCs, word processors and local area networks your office already uses. And with most of the new automation equipment you'll use in the future.

And when it comes to support, we won't leave you hanging. Whether you need something as simple as a few modems or as complex as a totally integrated digital voice and data system, we'll have it up and running in no time. And we'll back it up with our exclusive High Performance Service.™

So if you're up in the air about integrating voice and data, remember the voice and data supplier that can get you there one step at a time.

Communications Systems

NETWORK

from page 53

direct I/O dialing link for private branch exchange users. The service is said to enable users to initiate service changes by sending channel signal data to the telephone company's central office digital switch. Touted features include simultaneous voice/data transmission and avoidance of analog or digital conversions.

Other features planned by Nynex include a digitized Centrex enhancement called Intellipath that is initially slated for the cities of Boston and New York, where a concentration of fiber-optic and digital-switch capacity is available.

Feature capabilities

Features will reportedly enable customers to initiate service changes such as the number of direct inward dialing trunks used, automatic route selection, trunk queuing and station moves. Other features will reportedly offer incoming call identification and integrated access with dynamic allocation enabling customer trunk control via computers located at the users' business offices. Nynex also said it will add data communications features such as packet switching and electronic mail.

According to Nynex, these Centrex upgrades "provide customers with ISDN capabilities while permitting them to retain all the Centrex advantages they now enjoy." The upgrades are referred to as the "building blocks to ISDN."

Another planned Nynex service designed to keep the large-volume data communications user loyal to the local telephone company is Switchway. Switchway is a switched, 56K bit/sec. service that will permit businesses to have access to a dedicated private line on an as-needed basis.

Nynex said that it has already completed construction of two fiber-optic circles around Manhattan and one around Boston. Nynex's total lightwave mileage presently has reached 57,000 miles.

University networks

As another example of the migration to ISDN, Bell Atlantic recently announced the installation of Centrex-based local-area networks for two universities. The service is implemented by placing voice/data multiplexers in the customer's office as well as in the telephone company's switch center, avoiding duplication of separate voice and data lines. Data rates are said to range from 9.6K bit/sec. to 19.2K bit/sec.

Bell Atlantic also reported that it spent $1.9 billion in 1984 on local-exchange network and switch upgrades, including 24,000 miles of fiber-optic lines, and plans to spend $2 billion in 1985 on adding 158 digital switches and another 34,000 miles of fiber.

A separate $20 million, 5,800-mile fiber-optic network for Washington, D.C., will be finished this year, which will be linked to a dedicated digital Centrex service for the White House. Bell Atlantic said an additional 41,000 miles of fiber will be laid down in 1986.

Attractiveness of Centrex to fade as choices expand

Despite optimistic views that Centrex enhancements are forerunners of an Integrated Services Digital Network (ISDN) environment, the official view of the Federal Communications Commission, which regulates Centrex as a basic service, is not so rosy.

An FCC official said the commission has tried to maintain an even hand in Centrex regulation, although it could have killed it when AT&T was divested.

The FCC official, who requested anonimity, said that Centrex lines will eventually be charged the full $6 per line per month access charge, just as regular business lines are now being assessed, and added that the attractiveness of the service will not be so apparent.

"We've refrained from killing it because the former Bell companies had so much investment stranded in the service," he said.

Improvements in local loops

The official added that technological improvements in local-loop copper wire and the installation of fiber-optic capacity in cities where Centrex services are predominant could mean that a local loop will not be needed for every main station and would thus avoid the per-line access charge pricing system.

"As the cost of local access increases, fewer customer locations will be able to justify access lines into a private network," according to Perspective Telecommunications Group, a Franklin Lakes, N.J., research outfit. "Many of these locations will simply utilize a mix of public-switched services including Wats, MTS and other long-distance carriers. It is this area where the integration of local lines by ISDN and the resulting cost improvements may be the greatest benefit achieved."

Much of the Centrex development work came out of the AT&T Bell Laboratories facility that is dedicated to Bell Communications Research, which is the research arm of the seven Bell regional holding companies.

In a recent publication, the team leaders behind the Centrex work reported, "The ISDN design is consistent with the overall concept of Centrex, which is based on the switching and computing power of the central office."

Harris adds Unix-based supermini

MELBOURNE, Fla. — Harris Corp. has unveiled a 32-bit AT&T Unix-based supermini that uses Schottky bit-slice technology and is said to to perform in the 7 to 8 million instructions per second range.

The HCX-7 system is geared to the scientific and engineering user and is Harris' first machine to run Unix as its native operating system. It is priced from $225,000 and features the following:

- AT&T Unix System V, augmented with University of California at Berkeley Version 4.2 extensions.
- A set of 160 instructions pared down from a superset of most used instructions.
- Frequently used instructions — such as Call/Return — implemented in hardware, so that all instructions typically run in one machine cycle of 100 nsec.

A basic HCX-7 includes a CPU, 2M bytes of main memory, a console processor and terminal, an asynchronous controller, power supply and the operating system.

With the addition of 2M bytes of memory, a floating-point processor and an I/O expansion cabinet, the price starts at $275,000. Shipments will begin in July.

More information can be obtained from Harris, Computer Systems Division, 2101 W. Cypress Creek Road, Fort Lauderdale, Fla. 33309.

Disk drives not cure-all for storage backlogs

By Donna Raimondi
CW Staff

PATCHOGUE, N.Y. — Disk drives are being used as a Band-Aid for inefficient data management among users of IBM and compatible mainframes. Proof of this lies in the fact that in spite of a nearly 400% increase in capacity over the past few years, users are still buying disk drives at a breakneck pace. For example, IBM and IBM-compatible disk drive makers ship a total of roughly 70,000 new disk units each year.

Those were the conclusions of "The IBM Disk Report" prepared by Applied Management Services here, which noted that managers often fail to realize the economical solution to storage backlogs is to store information on existing disk drives more effectively. This can often be accomplished, the report said, by using disk management software packages.

A good disk management software package can help reorganize data fields, help to defer hardware purchases and reduce costly systems programming man-hours, the report said. Such a program can

CAD/CAM networking debuts

By Clinton Wilder
CW Staff

BEDFORD, Mass. — Computervision Corp. has unveiled a networking capability for its computer-aided design and manufacturing system that reportedly allows single-workstation users to access data from any point in a product design process.

The CDS II system represents the first complete workstation-to-host integration capability from Computervision, according to James R. Berrett, company president and chief executive officer.

CDS II, which will be available in mid-June, is said to allow individual engineers and project managers to access Computervision Cadds 4X and Cambridge Interactive Systems Ltd. Medusa design applications software. Berrett said that software includes approximately 400 applications packages for product design and manufacturing in mechanical, electronic and building construction fields.

Access to the software was previously

A new blue suit is nice, but can IBM change its stripes?

HARD TALK
Tom Henkel
CW Senior Editor

When IBM unveiled its long-awaited Sierra line of mainframes in February, it took extra care to emphasize that the 3080 line of mainframes was not a fading product. The dead-even performance of the 3080 Model 200 and the 3084 Model QX and the nearly two-year delivery date for the top-end 3090 Model 400 were intended as unquestionable statements that IBM has no plans to turn its back on hundreds of 3080 users.

Clearly, IBM's immediate reason for keeping the 3080 series alive was to bolster shabby first-quarter (and probably second-quarter) financial results. But the underlying rationale for tossing an olive branch to 3080 users was to keep those top IBM customers happy.

This is the new IBM — the friendly computer company.

IBM has been falling all over itself recently trying to undo what many have perceived as a "we're IBM, who cares what you think" attitude. It seems that in the process of establishing itself as the top computer company in the world, IBM has also gained the reputation of being the most arrogant.

But with changing times has come new IBM leadership. The friendly trend has been steadily evolving since John Opel took over as chief executive officer. Now with John Akers in the top seat, the nice-guy trend appears not only to be continuing but also intensifying.

The new, friendly IBM is not bad. Actually, it is quite nice. IBM seems to be honestly trying to keep users, consultants and even the trade press informed on what is happening behind the hallowed blue walls. There was a time when IBM appeared to consider everything from its sacred product strategy down to the color of the tile in its executive men's rooms a secret. Now you can actually ask IBM a question and sometimes get a reasonable answer.

But there is still some doubt over whether anyone is really buying all this friendliness. People who have been dealing with IBM for

TURNKEY SYSTEMS

■ **Data Recording Systems, Inc. has unwrapped its Laserscribe/8415 plain paper printer that can be driven by raster image processors such as those offered by Monotype, Camex, Inc. and Raster Graphics, Inc.**

The 8415 — available only to OEMs — comes standard with software-selectable, dual-density resolutions of 800 by 800 dot/in. and 400 by 400 dot/in. A standard draft mode of 400 by 400 dot/in. is said to print an 8½- by 11-in. page in 4 seconds.

The Laserscribe/8415 costs $30,000 in single quantities at OEM pricing.

Data Recording Systems, 80 Ruland Road, Melville, N.Y. 11747.

■ **Scan-Optics, Inc. has announced the Reliareader 542 for machine reading of characters from full-size paper forms.**

The 542 scanner uses a custom-integrated circuit developed by the vendor. It will be available in five models. One model will recognize characters from 256 templates, while the top model can recognize characters from 1,280 templates. Each template may represent a single character, the vendor said.

The reading subsystem of a Reliareader 542 is capable of speeds up to 2,000 char./sec. using the company's proprietary parallel processors. The custom circuits are said to allow products to be packaged in smaller boxes than allowed by first-generation optical character recognition products.

The Reliareader 542 is said to use programmable recognition logic, which allows users to adjust to a mix of printing devices. The 542 can accommodate the company's Image Capture and Compression Unit, which permits digital images of documents to be captured and compressed while the machine is reading. The subsystem captures images of 8½- by 11-in. pages at a resolution of 200 dot/in. at speeds of up to 200 page/min.

Prices for the Reliareader 542, scheduled for fourth-quarter availability, begin at $350,000.

Scan-Optics, 22 Prestige Park, East Hartford, Conn. 06108.

DISK

from page 57

range in price from $3,000 to $23,000, and it should provide reports, file maintenance, disaster recovery, standards enforcement and archiving functions.

Increasing corporate demands for information have been raising the pressure on DP executives to provide users with more storage. The demands on DP executives are, in turn, putting more pressure on IBM and the plug-compatible manufacturers (PCM) to provide faster, higher capacity, cheaper, more compact and more flexible storage alternatives.

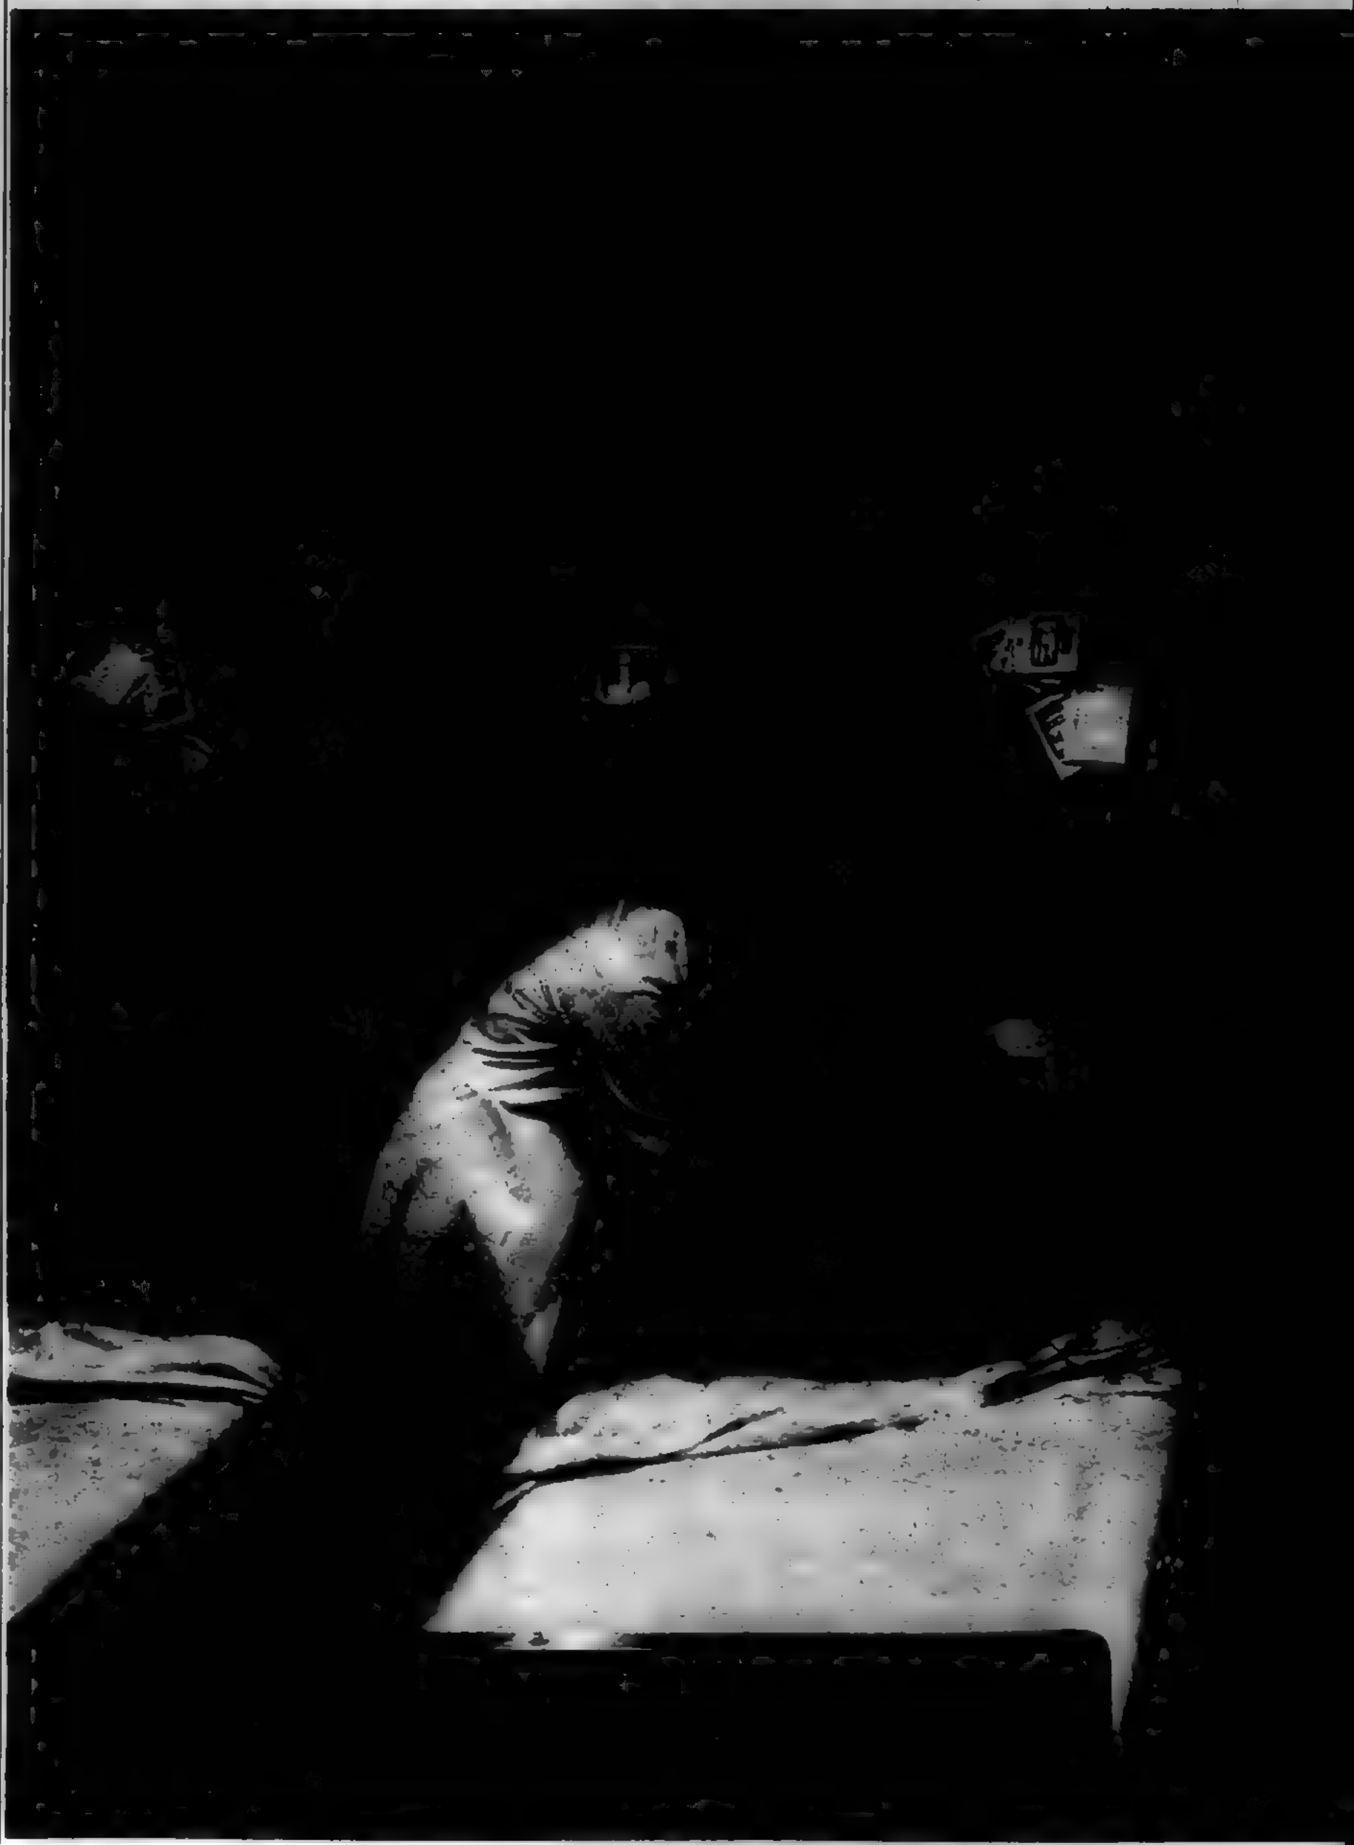
Large users are demanding drives — such as IBM's 3380 extended capability models — that will increase data storage capacity with smaller floor space increase requirements, the study said. Replacing older 3380 drives with these units can cost far less than constructing a facility to house more disk drive devices, it said.

IBM and the PCMs are transferring an increasing number of functions — such as encoding/decoding data, track and cylinder seeking, drive speed control, data buffering, diagnostics/maintenance — to the disk controller through the use of microprocessors, the report said. Putting these functions on the disk controller will generate a major increase in overall disk subsystem throughput, the report stated.

A shortage of data storage by the early 1990s could result from the current better than 50% annual million instructions per second growth rate of medium- to large-scale computer installations, the greater acceptance of IBM's MVS/XA operating system and the surge of personal computers poised to go on-line during the next few years, the report said.

Disk controllers, storage management software and specialized techniques, such as Winchester design and the thin-film process, must be enhanced if improved disks are to be managed and accessed efficiently.

The study — which costs $75 — is available from Applied Management Services, 180 E. Main St., Patchogue, New York 11772.



NICE

from page 57

years have gotten used to getting nonanswers and waking up to find that everything in their data centers has been rendered obsolete by IBM's latest product announcement.

Skepticism dies hard. When IBM rather suddenly starts being nice, the immediate reaction is to wonder, "What's up?" Crocodiles are said to appear to be smiling just before making it painfully clear that it's time for lunch, and you're it.

After all, why should IBM be nice? The company seems to be riding higher than ever. It has whipped the pants off virtually all its competitors and in the process managed to streamline its internal operations to churn out better products at a faster pace. If anything, this is a time when IBM could get away with being more arrogant than usual.

The reason rests in IBM's realization of a grim fact: it has become its toughest — and probably most ruthless — competitor. The products from smaller companies that are IBM-compatible, cost less and offer better performance aren't causing IBM its biggest problems. It's the continued rumors and speculation about how IBM will surpass its own products that spreads what one industry watcher is fond of calling "fear, uncertainty and doubt," among IBM users.

The 3080 series is a classic example. In anticipation of the Sierra, which turned out to be the 3090 series, most industry analysts were predicting the 3080 machines were about to join the ranks of the electronic dead. Consequently, in the two months prior to the 3090 announcement, 3080 sales almost came to a standstill. Even three months after the 3090 announcement and IBM's insistence that the 3080 is not on its way to the computer tar pits, IBM still is selling about half as many 3080s as it did a year ago. Even taking into consideration the recent overall slowdown in computer purchases, 3080 sales are still off.

Skepticism arises

Here's where the lingering skepticism comes into play. Historically, when IBM announced a line of mainframes, the old ones had about as much future as a crippled racehorse. IBM's claims that the 3080 is not dead are hard to swallow. The historical facts indicate otherwise. Then there are the rumors. Ever since the "Ivory Letters" on the 3090 Model 200 hit the streets, there have been persistent speculations that the system is a ruse — another 3081 Model D, if you will. The speculation goes that the "real," more powerful Model 200 will be announced when IBM is satisfied it has milked all it can out of the aging 3080s.

The theory of the bogus Model 200 is questionable. IBM appears set to deliver too many of the processors in late 1985 and early 1986 to pull off the old switcheroo in mid-delivery cycle. Remember, this is the new, friendly IBM.

But you can put money on the fact that if IBM has got a dual-processor 3090 Model 200 ready for high-volume shipments in the first quarter of 1986, there must be a uniprocessor version of the 3090 ready to be rolled out whenever IBM sees fit. If the Model 200 is, in fact, the real thing, the performance of the uniprocessor 3090 will wipe out much of the 3080 line.

So is IBM lying? Not really. There are two ways to look at IBM products: residual values and how a product fits into IBM's long-term product strategy. If you want to talk about residual values, the 3080 series is on its last strong drive. But in strategic terms, the machines appear to have some life left.

IBM seems to be promising it will not, at least for the next few years, dramatically change its large systems architecture in such a way that precludes 3080 series systems from taking advantage of the latest IBM software and operating system advances. That is not necessarily a promise that IBM will refrain from announcing systems which, from a price/performance standpoint, appear more attractive than the 3080s.

IBM, friendly or not, is and will remain in the business of making money. The latest trend toward being nice is nice. But don't take a few smiles to mean that the big blue giant has become gentle.

NET

from page 57

gained only through Computervision's high-end CDS 4000 computer-aided engineering and CAD/CAM minicomputer. Last week's announcement means that users of low-end workstations, such as the IBM Personal Computer AT, can access the capabilities of the host system.

The CDS II software also allows users of Digital Equipment Corp. VAX series minicomputers to tie into the CDS II network, the vendor said.

The price of the CDS II system is $10,000 per workstation, a company spokesman said.

Patchwork solution

CAD/CAM market analyst Peter Cohen of International Data Corp. in Framingham, Mass., called the Computervision product announcement a patchwork solution. "The ultimate solution will be to port the [Cadds 4X] software to run on all workstations," Cohen said. "But as a holding measure, the CDS II is a step in the right direction. It was very important for them to do something to integrate their hardware platforms. It's clearly the direction they have to go."

The company has seen its steadily eroding CAD/CAM market share result in sharp losses so far this year. The company reported an $18.8 million loss for the first quarter and has laid off 950 employees, the most drastic work-force reduction by any high-technology company outside the semiconductor industry [CW, April 15].

Although Berrett said the company expects to attract new users with the CDS II capability, Cohen believed the product will only help secure Computervision's installed base of customers.

"I suspect it won't be effective in attracting new customers, but it will keep their current client base satisfied until they develop something for fuller integration," he said. "The $10,000 price is a considerable addition to the base price of small workstations."

'Pent-up product appetite'

Berrett said the economic future of Computervision depends more on overall economic factors than on any product, including CDS II. "Our rebound depends on the rebound of the U.S. economy," he said. "We believe there is a pent-up appetite for our products, but our customers will decide at their board levels how much spending they can afford. We feel [the CDS II] clarifies for our sales force how to talk about our entire product line, and it gives us a system capability that we never had before."

Berrett said he could not predict near-term economic factors but that the company had no further layoffs planned.

Computervision is located at 15 Crosby Drive, Bedford, Mass. 01730.

TERMINALS

■ Paradyne Corp. has announced a workstation that is said to allow the centralized control of a data communications network from one console.

The Analysis workstation provides interactive access to network management information including problem detection and control of network software from a terminal. Host application systems such as IBM's NCCF and Network Problem Determination Application can be used, and the unit can be connected to a host IBM mainframe computer, the vendor said.

The basic unit, containing a terminal upgraded with communications facilities, Digital Research, Inc.'s Cdos operation system, two floppy diskettes with a total of 640K bytes of storage, 192K bytes of memory (upgradable to 640K bytes), the CRT and keyboard, costs $6,000.

Paradyne, P.O. Box 1347, 8550 Ulmerton Road, Largo, Fla. 34294.

■ GTE Telenet Communications Corp. has announced a network color graphics monitor for GTE Telenet public and private nets.

The Color Monitor is said to allow operations managers to view network operations in real time with color graphics. Operating parameters such as configuration, traffic levels and line performance appear in a variety of geometric shapes, numbers and lines. The unit costs $52,000.

GTE Telenet, 12490 Sunrise Valley Drive, Reston, Va. 22096.

SCIENCE/SCOPE

A new radar can map military targets with high resolution equal to that of infrared devices, even in rain and other bad weather. The Advanced Synthetic Aperture Radar System (ASARS-2), designed to complement electro-optic sensors, is flown on a U.S. Air Force TR-1 reconnaissance aircraft and provides real-time radar imagery to a ground station. ASARS-2 operates in all weather at ranges far exceeding the capabilities of infrared and other electro-optic devices, thanks to new state-of-the-art signal processing and other advances. The Air Force gave the system an excellent rating after it underwent strict operational performance tests as part of a "fly-before-buy" program. Hughes Aircraft Company is producing the system under a development and production contract. Eventually ASARS-2 is expected to be adapted for tactical aircraft and mobile tactical stations.

NASA's Project Galileo Probe, which will explore the planet Jupiter later this decade, must arrive at a precise angle if it is to carry out its measurements of the chemical composition and physical state of the Jovian atmosphere. The Hughes-built probe will arrive at 107,000 miles per hour, fast enough to travel between Los Angeles and Las Vegas in nine seconds. If the probe hits at too shallow an angle, it will skip off into space; too steep, it will be reduced to ashes. Even at the proper angle, the probe will encounter extremes never before faced by spacecraft. In less than two minutes, much of the forward heat shield will be eroded by temperatures of thousands of degrees. With atmospheric entry forces reaching 360 times the gravitational pull of Earth, the 742-pound probe will take on a weight equal to an empty DC-10 jetliner. Project Galileo is scheduled to be launched from the space shuttle in May 1986 and to arrive at Jupiter in August 1988.

Two versions of a new color image recorder, designed to provide the means to capture on film the precise color image from television monitors, have been introduced by Hughes. The high-fidelity TV recorders, Models CIR 100 and CIR 200, interface directly with a color display. They contain their own high-resolution, flat-face cathode-ray tubes, primary color filters, and controls for exposure and color. They record on either 35-mm or instant film with the high resolution, brightness, and color range necessary for scientific, medical, or other applications where accuracy is essential.

Lasers soon will be inspecting solder joints of fighter aircraft radars, thanks to new manufacturing technology being set in place at Hughes. Solder joints will be examined by a computerized technique using lasers and fiber optics, the glass threads that carry laser light transmissions. The process will free manufacturing personnel from tedious and time-consuming inspections of more than 36 million solder joints created in a single year's production. The project is part of an Industrial Modernization Incentive Program (IMIP) awarded by the U.S. Navy and Air Force. IMIP is a share-the-savings concept that will reduce costs of the F-14, F-15, and F/A-18 radar programs by more than $30 million, while improving the quality and reliability of the systems.

Hughes' Santa Barbara Research Center is seeking experienced engineers and scientists to further develop advanced IR focal plane technologies. We need custom integrated circuit designers, nuclear effects engineers, material scientists, semiconductor device scientists and process engineers, and IR system analysts. To learn how to become involved in this innovative technology, contact the Santa Barbara Research Center, Professional Employment, Dept. S3, 75 Coromar Drive, Goleta, CA 93117. Equal opportunity employer. U.S. citizenship required.

Ungermann-Bass undaunted by losses

Foresees upward turn after first-quarter dip

COMPANY PROFILE

By Kathleen Burton
CW West Coast Bureau

SANTA CLARA, Calif. — Local-area network vendor Ungermann-Bass, Inc.'s long string of uninterrupted financial successes has finally ended.

After averaging 50% growth a year and gaining $33 million from an initial public offering in 1983, the firm experienced a first-quarter loss this year of approximately $500,000, and revenue declined 23% to $11.9 million, compared with $15.5 million for the previous quarter.

Ungermann-Bass claims to be the world's largest supplier of general-purpose local-area networks, with approximately a 30% share of a market estimated by Dataquest, Inc. at $125 million for 1984. However, a variety of factors are causing mounting problems.

The company's first-quarter downturn was caused by a combination of short- and long-term factors, according to Harvey Freeman, an analyst at Minneapolis-based Architecture Technology Corp., a communications consulting firm. According to Freeman, the loss resulted from technical problems with radio frequency modem products, which curtailed delivery of broadband network products; restricted shipments of personal computer networking products because of a software conversion to Microsoft Corp.'s MS Network, which Ungermann-Bass has adopted as a de facto standard; and the slowing of shipments of broadband networks, now half of Ungermann-Bass' business, as the product line was converted to Intel Corp.'s 16-bit 80186 microprocessor.

Ungermann

James Jordan, Ungermann-Bass' executive vice-president in charge of marketing and product development, agreed that these problems set the company back but said they have been resolved. The new software and personal computer interface units will be available in June, the transition to 16-bit microprocessors has been completed, and the difficulties with offshore radio frequency modem production have been overcome, he said, with Ungermann-Bass' radio frequency modem plant in Japan in full production. "We're back on track after an unexpectedly bad first quarter and expect 35% revenue growth for the remainder of 1985," he said.

Founded in 1979, the company's initial success was built on the Ethernet-based Net/One system, one of the first Ethernet systems that used very large-scale integration technology to reduce interface costs significantly. Introduced in 1980, Ungermann-Bass' Net/One general-purpose local-area network proved popular among end users of Digital

Symbols indicate Apple lacks winning business strategies

"Work groups sharing a network need centralized storage for files and electronic mail. [Apple Computer, Inc.'s] file server will be just one of many file and disk servers on the market for the Macintosh Office."

— statement by Apple President John Sculley and Chairman Steven P. Jobs from Jan. 23 introduction of Macintosh Office

"Many people have asked when Apple will introduce a Macintosh that has a built-in hard disk, enlarged screen and the internal capacity to process very complex business applications. We already have such a Macintosh. It's called the Lisa 2/10 . . . we're changing its name to Macintosh XL — to communicate better that the XL is truly an extra-large Macintosh."

— comments by Mike Murray, director of marketing for Macintosh, at Jan. 23 introduction of Macintosh Office

ANALYSIS

By Peter Bartolik
CW Staff

Apple's Macintosh XL was the adult box that lent credence to Apple's insistence that the nifty little Macintosh was just "the first step in our larger plan to provide solutions needed by business."

Apple's file server was to be the "hub of the work group network," the machine providing multiuser data base and accounting functions. Rather than being in-

Geisco to revise market target, cut staff by 400

ROCKVILLE, Md. — General Electric Information Services Co. (Geisco) recently said it plans to revamp its business to target segmented markets and will lay off 400 marketing, sales and technical employees.

Walter Williams, Geisco's president, said the planned changes in the computer services company mirror the change in the market from a "generalized to a segmented business." Geisco, a subsidiary of General Electric Co., said it plans to outline further its reorganization on June 4.

"Geisco must more aggressively execute

Black hole in home micros?

INDUSTRY INSIGHT
Paul Korzeniowski
CW Senior Writer

Although I am loath to admit it, in many ways I fit the yuppie mold, with desires for a videocassette recorder and cable television, not because I need them, but rather because without them, I feel like I am missing something important.

I consider myself at the crest of the home computer buying wave, which will crash when droves of yuppies transform home computers into chic status symbols.

For a few years, I had contemplated buying a micro to write stories at home, and two months ago I decided that the time was right.

Home computer prices were falling. Systems were advertised for only several hundred dollars rather than a few thousand dollars. Therefore, I set out in earnest to purchase, not merely to price, a home computer.

My first stop was at an Apple Computer, Inc. dealer. I told the salesman that I wanted a WP package with a letter-quality printer and a $1,500 price tag. He showed me an Apple IIe and a dot matrix printer for $2,100. That was not exactly what I was looking for, so I repeated the request. He showed

TI president, CEO resigns after 32 years with firm

DALLAS — Texas Instruments, Inc. President and Chief Executive Officer J. Fred Bucy recently resigned after 32 years with the company and Executive Vice-President Jerry R. Junkins was been named to replace him.

Bucy, 56, said he was resigning to pursue other interests and to take advantage of TI's early retirement program, which allows employees to retire at 55.

Bucy also resigned from his seat on the board of directors and will continue to serve the board in an advisory capacity, according to the company.

TI is coming off one of the worst quarters in its history with earnings off 80% from the previous year [CW, April 29].

Chip market down

Hit especially hard by the slumping demand and product backlog in the random-access memory semiconductor marketplace, TI announced the layoff of 1,000 employees in April.

Junkins, 47, was most recently responsible for TI's government electronics, data systems and industrial controls divisions and for the company's internal information systems and services organization.

Junkins worked at TI since 1959 and was elected to the board of directors in 1984.

DATA BASE FAT.

HOW TO AVOID IT, FROM THE LEADER
IN ON-LINE TRANSACTION PROCESSING.

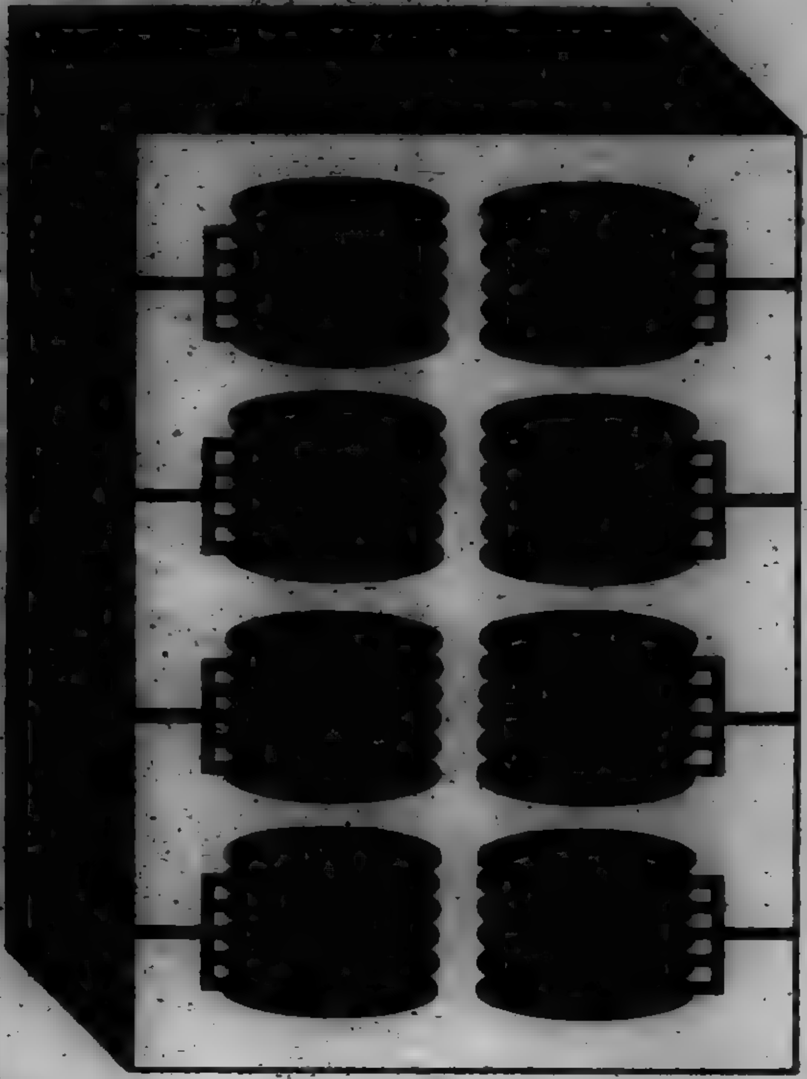
WHAT DATA BASE FAT IS.

It's a waste of time and space — the time it takes to access data and the space required for the storage. It's a hardware problem and a software problem and Tandem has solved them both.

NEW NON-FAT HARDWARE.

Introducing a new disc drive product called the Tandem V8.

The data base that would normally be stored on one large, conventional disc has been split up over eight small, high-density discs.



NEW TANDEM V8.
8 disc drives, 8 actuators in one cabinet.

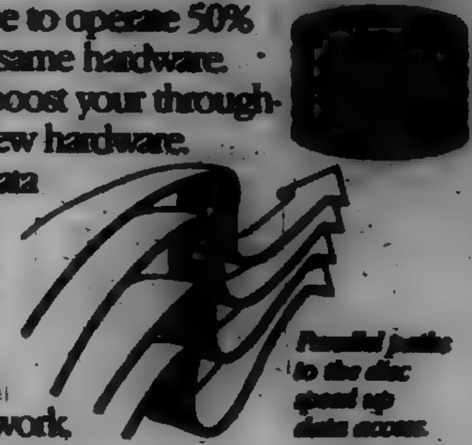
Instead of one actuator handling I/O requests sequentially, eight actuators can now work simultaneously. No disc space goes unused.

The Tandem V8 gives you high throughput, stores 1.3 gigabytes of data, yet remarkably takes up only six square feet of floor space.

Maintenance is easy, too. Each disc drive can be removed and replaced in a few minutes. And the Tandem V8 can stay on line even while it's being serviced.

NEW NON-FAT SOFTWARE.

We've developed new data base software that allows our relational data base to operate 50% to 100% faster on the same hardware. That means you can boost your throughput without buying new hardware. Massive amounts of data can be made easily and instantly available to hundreds of users, even if they're geographically distributed over a worldwide network.



Parallel paths to the disc speed up data access.

TANDEM'S GROWTH ARCHITECTURE.

When you outgrow a Tandem system, you don't replace it. You just add to it. You can start with two processors in a local system and expand at any increment you choose, all the way to 4,080 processors worldwide. You never buy more than you need.

Tandem matches need. The competition overspends it.

With Tandem, your software expands, too. So you only write applications once. It's also a fault-tolerant system that stays on line without using idle backup components. Instead, each component has at least one identical copy with which it shares the workload. No single failure can shut you down.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the U.S. Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

TANDEMCOMPUTERS

Study: Women at low end of computer jobs spectrum

By Kathleen Burton
CW West Coast Bureau

PALO ALTO, Calif. — Computer-related occupations have failed to provide women either with sufficient opportunities for advancement or top-of-the-line salaries.

So said a national study released by Stanford University researchers. According to the study, men clearly held most of the high-paying occupations in computer-related industries, while women worked in the lower paying occupations in the industry.

The study, by Myra Strober, an economist and director of Stanford's Institute for Research on Educational Finance and Governance, "dispels the myth that high technology is automatically a great equalizer of occupational disparities between men and women," Strober wrote.

Held low-level jobs

Comparing 1970 and 1980 census data, the study found that most women in high-technology industries held clerical or low-level production jobs, while most men held production, managerial and professional-technical jobs.

"In the highest paid, highest prestige computer-related occupations, women are virtually absent," the report stated. "In 1970, women were only 2% of all engineers in the computer industry; in 1980, that number increased to only 5%," the study found.

And women computer scientists and systems analysts grew only 7% over the decade, even though these professions themselves more than doubled in size.

Results surprising

According to Carolyn L. Arnold, a graduate student at Stanford University who coauthored the study, the results were surprising, because there are now so many women getting degrees in mathematics and science. However, this disparity may be the result of a male-oriented "engineering culture that continues to bar women from the upper ranks of these professions," according to Arnold.

Another factor contributing to the results, Arnold said, is that the work pressures and long hours of professional jobs in technological industries may still be a barrier for women who are trying to balance their home and work lives.

There is a common misconception that computer-related industries are less stereotyped than older industries, allowing talented women open access to fast-track career paths and high salaries, asserted Sandra Kirkpatrick, assistant director of the Stanford institute.

Successful individuals

For some women, this is true, Kirkpatrick said. "There are always individual women who are making it in areas like the Silicon Valley, but nationally the aggregate is not doing very well," she said.

The Stanford study also found significant salary discrimination between men and women in computer-related occupations. Of the three high-technology professions that were studied — systems analysts, programmers and computer operators — women earned approximately 72% of the salaries of their male counterparts, Kirkpatrick said.

According to Kirkpatrick, men earn more than women largely because women are still working in lower paying, end-user industries, rather than in those professions that develop and manufacture the hardware and software.

The lower paying, end-user industries studied included banking, insurance and retailing, Kirkpatrick said.

In spite of the salary disparity, however, women continue to choose high-technology professions because "they are still optimistic about high technology opening doors for them," Kirkpatrick said.

They've earned their stripes.

The supplies that wear the IBM stripes must first prove themselves worthy of the distinction.

Before they can join the ranks of all those IBM supplies that have gone on to serve IBM customers so well, they've got to meet some stiff standards.

Our IBM supplies have to pass a series of rigorous inspections and battle their way through a barrage of quality controls.

This means every time you buy IBM word processing or data processing supplies, you're assured of getting a supply product specifically engineered to meet the demands of your IBM equipment. Supplies that are designed to help you get the maximum performance out of your machine.

Layoffs loom over Wang for first time in 12 years

LOWELL, Mass. — For the first time in some 12 years, Wang Laboratories, Inc. may resort to layoffs as a means of reducing expenses. The office automation leader announced last week that as many as 100 employees may be dismissed in 30 days.

The layoffs will affect administrative staff workers at Wang's corporate headquarters here. The company has already transferred some staff workers into sales, support and maintenance positions.

Approximately 100 additional employees will be dismissed with severance pay if Wang is unable to find positions for them.

Wang had announced earlier that most of its production work force would be required to take its vacation time during a production shutdown this summer. The company is also curbing nondiscretionary spending.

Recovery effort follows 66% profit drop

Wang is trying to recover from the worst downturn in its successful history. Its profits fell 66% in the quarter ended March 31, the first earnings drop for Wang since 1975 and a marked contrast to its consistent 30% growth rates of the last several years.

Industry analysts said Wang has been hurt by both the overall slowdown in computer demand as well as a loss of office automation market share to IBM products such as the System/36. Wang is attempting to regain customers with an aggressive advertising campaign against IBM.

Wang, which employs 30,000 people worldwide, has not ruled out future layoffs as cost-cutting measures.

Prime files suit against repair firm

DENVER — Prime Computer, Inc. recently filed suit against a small, Colorado-based third-party software maintenance firm for allegedly infringing on Prime copyrights and misappropriating trade secrets.

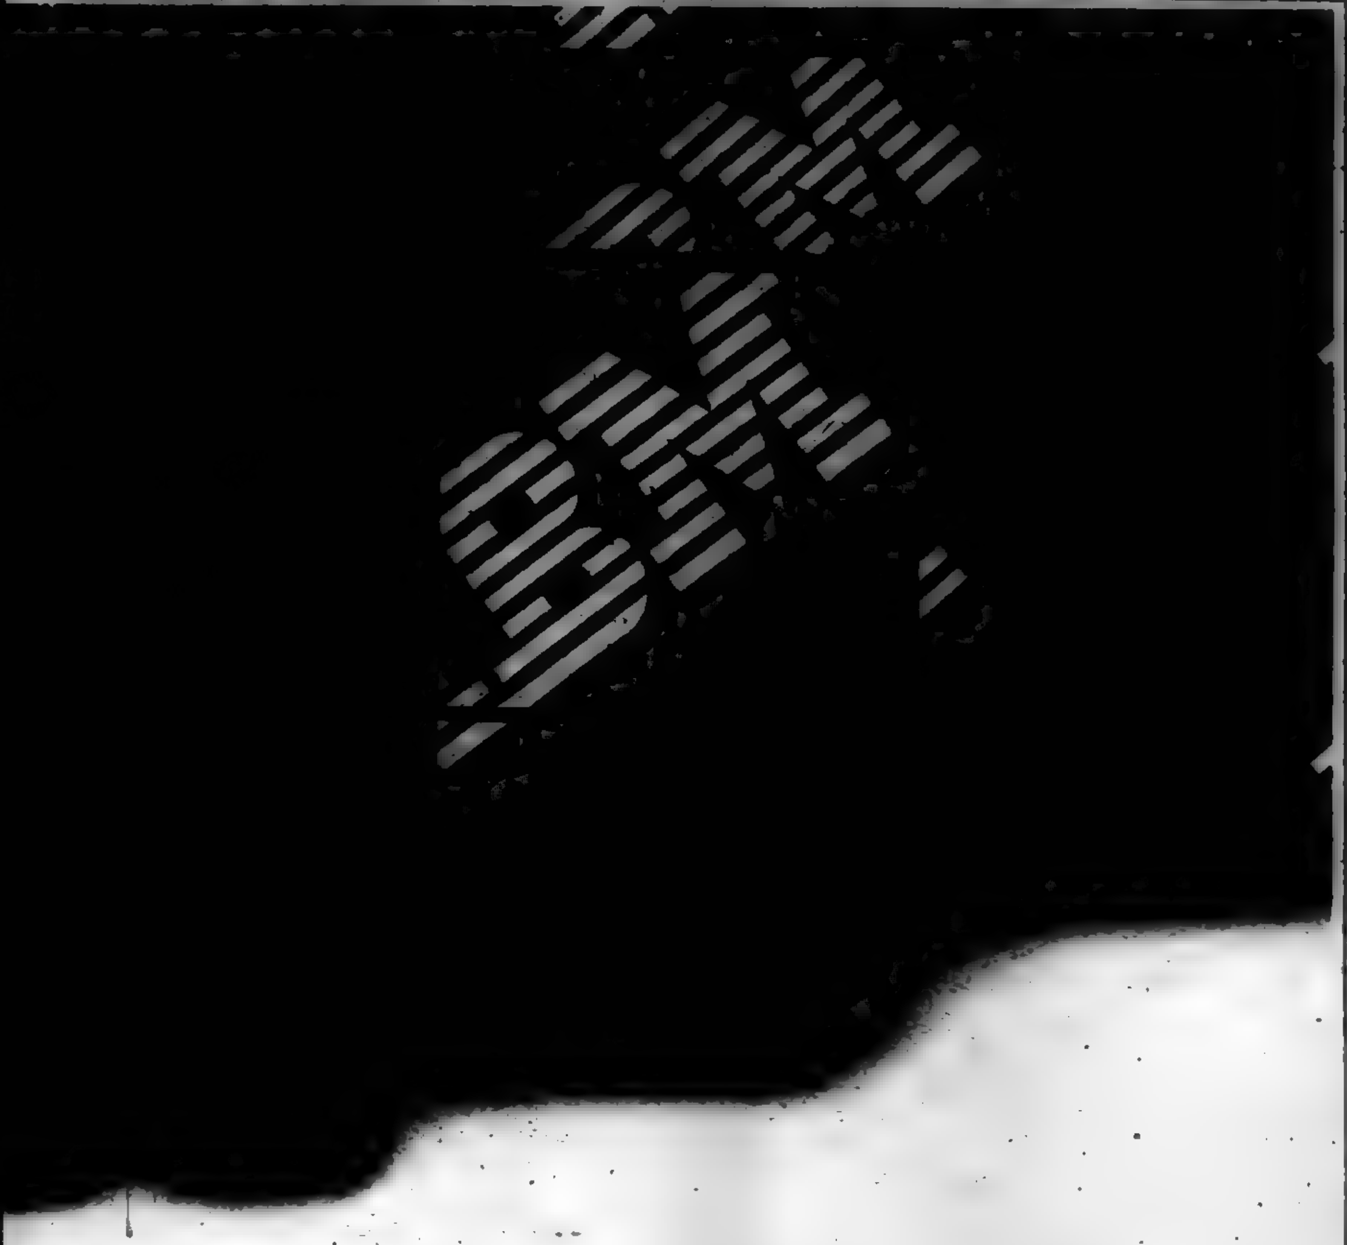
Prime is seeking a preliminary injunction against Tristan Dynamics, Inc. of Parker, Colo., that would require the defendant to deliver all Prime materials in its possession to the U.S. District Court here. The suit was filed May 17.

Tristan Dynamics is a privately held, 50-employee company that services users of Prime software systems. Tristan claims to have benefited from user dissatisfaction with Prime's policy of bundling maintenance contracts for its hardware and Primos operating system [CW, Oct. 15, 1984].

In the suit, Prime is also seeking to recover actual and multiple damages and to prevent permanently Tristan from using Prime materials in its maintenance business. Prime has charged that Tristan induced former Prime employees who went to work for Tristan to breach Prime's nondisclosure agreements and bring field engineering manuals and other proprietary materials relating to Prime software maintenance to Tristan.

A Prime spokesman said the litigation is "in accordance with Prime's ongoing effort to police vigorously and protect its proprietary information rights." Prime is headquartered in Natick, Mass.

Tristan Dynamics President Bill Sheppard declined to comment on the lawsuit.



We've made it our business to make supplies that inspire confidence day after day after day. So when you have to perform even above and beyond the call of duty, it's IBM supplies you can depend on.

The next time you're in the market for supplies, choose the ones that have earned the right to wear the IBM stripes.

More convenient ways to buy. To get the IBM supplies you need, contact an IBM supplies representative or visit an IBM Product Center or IBM supplies dealer. For the store location nearest you, or to place an order by phone, call IBM Direct 1 800 IBM-2468, Ext. 90.

IBM®

IBM net market entry force in Ungermann-Bass buildup

COMPANY PROFILE

Ungermann-Bass, Inc.'s decision to strengthen its product lines and technologies is strongly influenced by IBM's entry into the local-area network market.

Although IBM announced its PC Network for personal computers in August 1984, the network is only now reaching the market. And IBM's token-ring network, developed in cooperation with semiconductor manufacturers Texas Instruments, Inc. and Intel Corp., has yet to appear on the market.

Even though IBM's products have not yet reached the market, Big Blue's presence is strong, and the trend toward IBM compatibility is clear, according to Ungermann-Bass President and Chief Executive Officer Ralph Ungermann. The company will avoid competing directly with IBM but will align its products with IBM's and support IBM's token-ring standard, Ungermann said.

Vendor-independent solutions

According to Ungermann, IBM's approach to local-area networks will be to interconnect IBM equipment with token-ring and Systems Network Architecture technologies. Though Ungermann-Bass will support this, he said, it will continue developing vendor-independent solutions that will also allow users to take advantage of both Ethernet and broadband technologies.

William Krause, president of 3Com Corp., an Ungermann-Bass competitor based in Mountain View, Calif., said that IBM's entry into local-area network markets adds credibility to the local net concept.

"It also means IBM won't introduce distributed connection products because it doesn't want to cannibalize its existing mini and small mainframe products," Krause said.

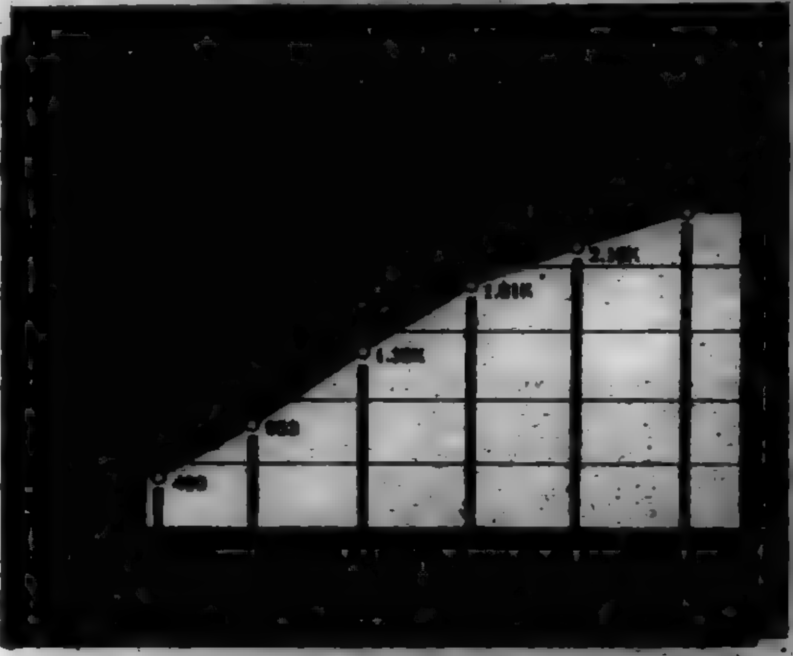
IBM net entry breeds uncertainty

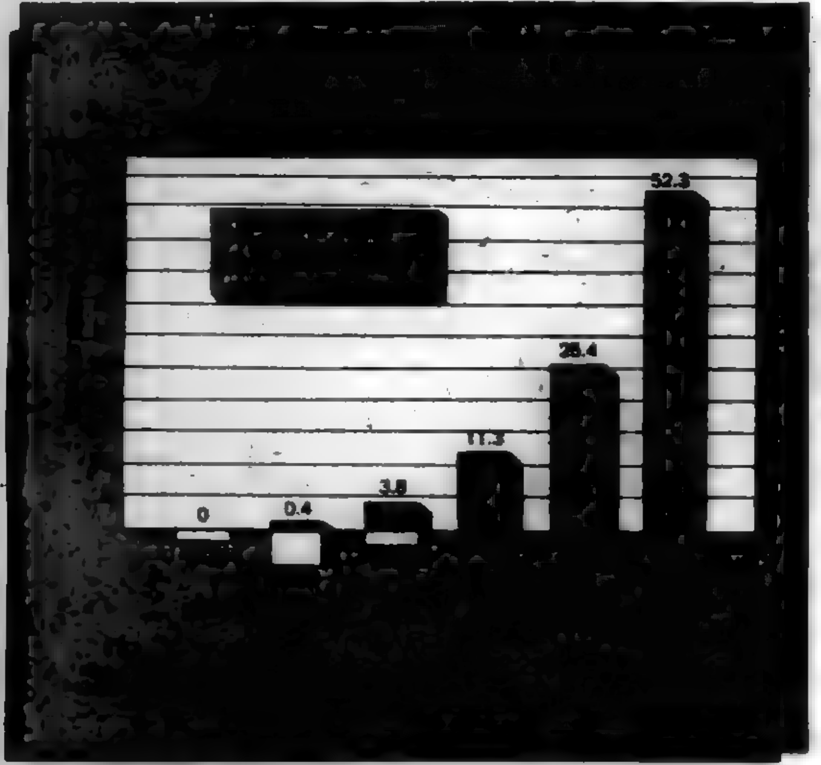
On the downside, however, IBM's foray into local-area nets breeds uncertainty, and customers will delay local-area network purchases to wait for IBM's future products, Krause said.

According to Karen Mulvaney, a local-area network specialist with New York-based L. F. Rothschild, Unterberg Towbin, there are enough weaknesses in the IBM product line to keep Ungermann-Bass viable, offering alternative but IBM-compatible solutions. "I don't think IBM has a master plan for local-area networks," Mulvaney added. "[It's] getting into a whole new marketplace, taking it one step at a time and learning [along the way]."

Early fears that IBM would dominate the local-area net market by establishing a single networking standard have disappeared, she said. "IBM may make one or two of its local-area networks a de facto standard, but more than that is not likely, as it would confuse the marketplace."

— Kathleen Burton





PROFILE

from page 61

Equipment Corp. systems seeking a cost-effective method of interconnecting mini and terminal bases.

"Ungermann-Bass was the only [local-area network] game in town in 1979," said Brian Jeffery, director of research for the Palo Alto, Calif.-based consulting firm International Technology Group, Inc. Systems vendors like DEC were slow to introduce their own products, and most of the other firms competing in this market failed to develop credibility, Jeffery said.

The company faces a new set of challenges this year, according to President and Chief Executive Officer Ralph Ungermann. These include an energized IBM, a predicted market shakeout and a horde of competitors moving into markets once dominated by Ungermann-Bass.

According to Ungermann, competitors in Ethernet products include Bridge Communications, Inc. in Mountain View, Calif., and Interlan, Inc. in Westford, Mass. Competitors in the personal computer area, Ungermann said, are IBM; Nestar Systems, Inc. in Palo Alto, Calif.; Corvus Systems, Inc. in San Jose, Calif.; and 3Com Corp. and Sytek, Inc., both in Mountain View, Calif. Also offering a threat in private branch exchange-based systems are IBM, AT&T and a

Net maker's focus: factories

Local-area network manufacturer Ungermann-Bass, Inc. is nothing if not ambitious.

With a joint venture with industry giant General Electric Co. under its belt, Ungermann-Bass will obtain a 100% market share in the emerging market for factory local-area network systems, according to Ralph Ungermann, company president and chief executive officer. A multimillion-dollar contract with General Motors Corp. to develop local-area networks for its assembly and fabrication plants lends credibility to this supposition, he said.

Davidson

The Yankee Group, a market research firm in Boston, predicted that the factory local network sector will grow from $50 million in 1984 to $1 billion by 1990.

Like many other vendors that have targeted this market, the Ungermann-Bass/GE joint venture, Industrial Network, Inc., is focusing on the Manufacturing Automation Protocol (MAP) standard, originally developed by GM in cooperation with a group of vendors including IBM, that is gaining wide support.

"Factory local-area networks are a huge market," Ungermann said. GM will spend $60 billion over the next five years to automate truck and bus assembly plants, much of this for net technology, he added.

The problem facing Ungermann-Bass, however, is that the MAP standard has already drawn a number of serious competitors, including Concord Data Systems, Inc., a Waltham, Mass.-based broadband local-area network vendor that was one of the original GM MAP program participants, and IBM itself, which plans to offer its own MAP-based system.

Ungermann-Bass remains confident it can beat the competition, however. With GE providing $6 million in funding and its token bus product expected by the second quarter, the company has an important technological edge, Ungermann-Bass officials said.

Ungermann-Bass' technical trump card is its proprietary very large-scale integrated technology, noted John Davidson, the company's vice-president of research. He said its token bus semiconductors will not be released into the marketplace, which means that Ungermann-Bass has a two-year lead time over other network vendors that must wait for token bus chips.

"Ungermann-Bass will never gain 100% of the factory local-area network market," said Brian Jeffery of Palo Alto, Calif.-based International Technology Group, Inc. He contended that most large-volume end users will want a multivendor approach to factory automation.

— Kathleen Burton

PROFILE

from page 66

variety of other PBX vendors.

Despite this mounting competition, Ungermann-Bass' strategy involves expanding its product lines and marketing organization to cover all segments of the local-area network market. In June the company expects to introduce a number of products, including a broadband-based token bus for the industrial automation market and network interface units that will connect IBM terminals and controllers. Also slated for introduction are a token-ring version of its Net/One product and an IBM-compatible token-ring interface device.

Jordan

Bracketing the local-area network market with a range of products is critical to Ungermann-Bass' long-term success, said John M. Davidson, the firm's vice-president of research. The company will continue to follow major market trends by adding products, Davidson said. "At the risk of spreading our technology too wide, we'll remain market driven. If a customer needs it, we'll put a new product into the lineup," he said. This foray into many different technologies is the key to success, letting the company win major contracts from large OEM vendors like Hewlett-Packard Co. and Xerox Corp., Davidson said.

This ambitious across-the-board game plan has drawn mixed reviews from analysts. "Ungermann-Bass does have a tendency to spread itself too thin. It should go deeper into specific [local-area network] segments," observed Karen Mulvaney, a local-area network specialist with New York-based L. F. Rothschild, Unterberg Towbin. This strategy is risky, Mulvaney said, because Ungermann-Bass' Ethernet-oriented competitors have breadth within individual local-area network sectors and are constantly introducing products. "Ungermann-Bass will have to run like crazy to keep up," she predicted. To do so, the company has targeted a hefty $12 million (approximately 15% of its 1985 revenue) to research and development projects this year, she said.

According to Paul Scherer, an analyst with Robertson Colman & Stephens, Inc., a San Francisco investment firm, Ungermann-Bass will survive a shakeout that, by decade's end, will reduce the field of general-purpose local-area network manufacturers from 60 to 20 vendors.

Ungermann-Bass has several strengths that will allow it to do this, Scherer said. It is the leader in the terminal connection segment of the market and is also investing heavily in the rapidly growing personal computer area, which now represents 10% of its revenue. And with an 1,100-unit installed base, the company is well positioned to gain more add-on clients that now account for 80% of its business, Scherer said. Additionally, the local-area network market as a whole will be helped by the emergence of protocol standards, Scherer added, with IBM's personal computer network and token-ring technology speeding this along.

Ungermann-Bass is also using third-party tie-ups to build up its market presence as it faces today's tough competition, Scherer said. It has a joint five-year marketing agreement with Codex Corp., a data communications vendor and member of Motorola, Inc.'s Information Systems Group, creating a valuable distribution channel. In 1984 it solidified a joint venture partnership with General Electric Co. to develop a factory floor local-area network. It also has OEM arrangements with industry heavyweights like HP, Xerox and Data General Corp.

In 1983 the company acquired the New York-based Amdax Corp., gaining Amdax's substantial broadband technology design and manufacturing expertise. The future will bring similar joint venture arrangements for the company. "We look at five companies a week with this in mind," Ungermann said, "but nothing is on our list right now."

> *'We're definitely not the same company we were six years ago. We started planning for this transition a year ago, right after the initial public offering.'*
>
> — James F. Jordan
> Ungermann-Bass

Ungermann-Bass is struggling to come to terms with what Jordan described as its "next-growth phase." "We passed the $50 million revenue mark last year. We're definitely not the same company we were six years ago," Jordan said.

The company was shaken last year by a series of management shifts that reorganized the marketing department and consolidated four separate engineering groups under Jordan's supervision.

The company was also rocked by the March departure of Charles Bass, board vice-chairman and cofounder, who left the company to pursue venture capital interests. However, according to Jordan, Bass' departure will not affect company strategy or product introductions because "we started planning for this transition a year ago, right after the initial public offering."

In spite of these changes, Ungermann-Bass has been working hard to keep its entrepreneurial spirit while it moves into a more mature growth phase, Jordan said. He cited the company's engineering groups in Massachusetts, Florida, California and Japan as examples. Because each group is developing a different local-area network technology, each is run as an independent venture, which enhances creativity, he said.

The company will rely increasingly on marketing to gain an all-important competitive edge, Ungermann said. Two factors that Ungermann hopes will differentiate Ungermann-Bass from the competition are service and support. "[Local-area] networks are relatively simple, but the critical thing for Fortune 1,000 customers is that they'll perform perfectly," he said. To provide increased service, Ungermann said, direct sales sites are now doubling as customer support groups, offering installation, technical training and on-site repair.

Ungermann-Bass has also moved recently to deal with what analysts call its biggest weakness: a lack of networking software. The company recently acquired 20% ownership of Linkware, Inc., a Boston-based software manufacturer. The two companies are working on several networking products scheduled to be introduced at the end of the quarter, Davidson said.

Network management software, also expected by the end of the second quarter, will be critically important, Davidson said. The software will diagnose hardware problems on computer equipment and "won't automatically blame problems on the network," according to Davidson.

Introducing R:base
Because your people
be using applications than

If you're like most M.I.S. directors, you're under pressure to be more productive than ever before.

And now, there's a new DBMS product that can take this heat off your department.

It's the all-new R:base™ 5000.

It doesn't matter if it's being used by your top programmer, a rookie sales manager, or anybody else in the company. With new R:base 5000, your people can develop custom, heavyweight applications—and save hours, even days of development time.

The secret of new R:base 5000? A unique, menu-driven Application Express™ feature that actually generates programming code. While guiding your users through the entire development process. So, instead of entering thousands of keystrokes, or writing lines of code, they just answer a series of simple questions. Then, the Application Express does the rest. To speed things up even more, it includes instant forms and reports, too.

5000.
would rather
waiting for them.

New R:base 5000 also features a fast new way for your staff to set up their databases: visually. They simply fill in the blanks in an on-screen table. And if they want to build menus into an application, they just tell the Application Express what to do, and it writes the code automatically.

For the novice users in your company, our new Application Express is a way to write complex applications right off the bat. And new R:base 5000 gives veteran programmers the heavyweight procedural language they need to build sophisticated applications and systems—with or without the Application Express. Either way, they'll always save time and increase their productivity. Because R:base 5000 also gives them fast and easy rules verification and data entry, along with a comprehensive report writer. There's even a compiler, to protect their application code.

New R:base 5000. It's the best way to give the whole company a big boost, and give yourself a break at the same time. Want to find out how? For only $9.95 (plus shipping), we'll send you an interactive tutorial that actually lets you build sample applications. Just call 1-800-547-4000, Dept. 976. In Oregon, or outside the U.S., call 1-503-684-3000, Dept. 976. Or visit your nearest computer store or software dealer. (If you own R:base 4000, see your dealer about our trade-up kit.)

And see what it's like to have everything running your way.

PRODUCTIVITY:
R:base 5000 vs. dBASE III

CLIENT DATABASE MENU

Using R:base 5000 and dBASE III™, we built this menu and linked it to its subroutines. The resulting applications were equivalent. The effort required wasn't.

	R:base 5000	dBASE III
Automated steps	37	0
Command lines	47	244
Keystrokes	434	6568
Time*	9 minutes	2 hours

*Actual time may vary depending upon skill level.

Your way. That's R way.™

Datapoint profit loss exceeds predictions

SAN ANTONIO — Datapoint Corp. recently announced a loss of $28 million, or $1.40 per share, for the third quarter ended April 27. The company had previously said it expected a loss of $20 million, or $1 per share.

Edward P. Gistaro, president of Datapoint, said the loss reflected pretax charges of about $27 million for costs associated with work force reductions, office closings, equipment write-downs, of which $6 million was associated with the change in management control, and other charges. Partially offsetting the charges was an extraordinary after-tax gain of $1.9 million resulting from the repurchase of subordinated convertible debentures, the company said.

Revenue for the quarter was $125.5 million, compared with $156 million a year earlier. Operating losses amounted to $37.4 million.

Noting significant progress in restructuring the company, Gistaro said future operating costs have been cut by about $56 million, exceeding the earlier target of $40 million.

In the third quarter of 1984, Datapoint posted profits of $7.9 million, or 30 cents per share.

DG sues Loral after Mil-Spec buy

BOSTON — Data General Corp., an unsuccessful bidder for the Rolm Corp. Mil-Spec Computer Division earlier this year, has filed suit here against successful bidder Loral Corp.

DG, which has supplied its minicomputers to Mil-Spec to be ruggedized for military applications, is seeking to block the transfer of that technology to Loral. DG said the continuance of its relationship with Mil-Spec under the division's new ownership would violate "each and all of the license agreements" made between DG and Rolm for Mil-Spec business since 1969.

In the suit, filed in U.S. District Court here, DG said some of its license agreements for Rolm to market DG's Nova, Eclipse and Hawk computers are not assignable to a different vendor, while others require DG's written consent.

Loral is in the process of acquiring the Mil-Spec division for a reported $100 million. Rolm was required to sell Mil-Spec following IBM's acquisition of Rolm last year.

DEC alleges violation of patents

BOSTON — Digital Equipment Corp. last week filed suit against EMC Corp., a Natick, Mass.-based vendor of DEC-compatible memory controllers, interface boards and memory boards, for allegedly infringing upon DEC patents.

The suit, filed in U.S. District Court here, specifically seeks a permanent injunction to prevent EMC from making and selling VAX-11/780- and VAX-11/785-compatible memory controllers, Synchronous Backplane Interconnect (SBI) interface boards and memory boards. DEC is also seeking treble damages for profits it allegedly lost because of the sale of the compatible products.

The suit is the most recent of several patent infringement claims by DEC. The Maynard, Mass.-based minicomputer market leader is currently pursuing damages from System Industries, Inc. of Milpitas, Calif., for allegedly using proprietary information to make products compatible with SBI interconnects.

In the past, DEC has successfully won lawsuits against vendors for using patented information to make products compatible with DEC Massbus backplanes and RL disks.

THE NIU-180 LOWERS
COST-PER-CONNECTION.

Announcing the NIU-180: the first of an extraordinary new family of Network Interface Units that represents a direction everyone's been waiting for in local area networking. *Much higher performance. Much lower cost.*

In terms of cost-per-connection, the eight-port NIU-180 is the lowest ever.

In areas where equipment is concentrated, the NIU-180's eight RS-232 ports bring per-connection local area network costs to a new low.

With 16-bit architecture and advanced VLSI, we've packed more memory, more functionality, and more flexibility than ever before into a single unit. At substantially reduced costs.

Because these are Net/One® NIUs, the connections can be with the medium of your choice. Broadband, baseband, optical fiber.

And because these NIUs® are Net/One products, they are a compatible extension of Net/One. The only difference is even higher performance than you've come to expect from what was already the high performance standard. More speed. More power. Less money.

Net/One brings
connections out wh

COMPUTER INDUSTRY

NICKELS AND DIMES

Decision Data Computer Corp. announced revenue for the first quarter ended Feb. 28 of $43 million, compared with $32.9 million in the same period one year earlier. Profits were $2.6 million, or 32 cents a share, compared with $1.7 million, or 21 cents per share, for the corresponding period last year.

■

Computer Technology International, Inc. reported revenue for its first fiscal quarter of $11.7 million, compared with $688,000 for the same period a year ago. Profits for the period ending Feb. 15 were $102,914, compared with $102,000 in the same period a year ago.

■

VLSI Technology, Inc. announced revenue for the first quarter of $18.6 million, compared with $14.2 million for the same period last year. Profits were $813,000, or 4 cents per share, compared with $1.3 million, or 7 cents per share, in the corresponding period a year earlier.

■

Valid Logic Systems, Inc. reported revenue for the first quarter ended March 31 of $15.7 million, compared with $9 million for the same quarter last year. Profits were $1.5 million, or 11 cents per share, compared with $1.2 million, or 9 cents per share, in the same period last year.

■

Intergraph Corp. announced revenue for the first quarter ended March 31 of $108.9 million, compared with $78.7 million one year ago. Profits were $14.3 million, or 55 cents per share, compared with $10.3 million, or 40 cents per share, in the same period one year ago.

■

Nashua Corp. reported profits for the first quarter ended March 29 of $4.1 million, or 86 cents per share, compared with $5.9 million, or $1.25 per share, in the same period a year ago. Revenue for the quarter totaled $147.7 million, compared with $152.8 million in the corresponding period one year ago.

■

Daisy Systems Corp. announced revenue for the second fiscal quarter ended March 31 of $29 million, compared with $15.7 million for the comparable quarter one year ago. Profits for the quarter were $4.7 million, or 27 cents per share, compared with $2.6 million, or 17 cents per share, in the same quarter a year ago.

■

The Reynolds & Reynolds Co. reported revenue for the second quarter ended March 31 of $82.5 million, compared with $72.3 million in the same period last year. Profits were $4.8 million, or $1.02 per share, compared with $4.2 million, or 88 cents per share, in the same period a year ago.

■

Applied Data Research, Inc. reported revenue for the first quarter of $34 million, compared with $21.5 million a year ago. Profits were $566,000, or 10 cents per share, compared with $332,000, or 6 cents per share, in the same quarter a year ago.

■

Timeplex, Inc. announced revenue for its third fiscal quarter ended March 31 of $34.6 million, compared with $17.7 million in the same quarter a year ago. Profits were $2.2 million, or 26 cents per share, compared with $1.6 million, or 19 cents per share, in the same period last year.

■

Cipher Data Products, Inc. reported revenue for the fiscal third quarter ended March 31 of $44.4 million, compared with $32.8 million in the same period one year ago. Profits were $4.3 million, or 30 cents per share, compared with $3.3 million, or 23 cents per share, in the comparable period last year.

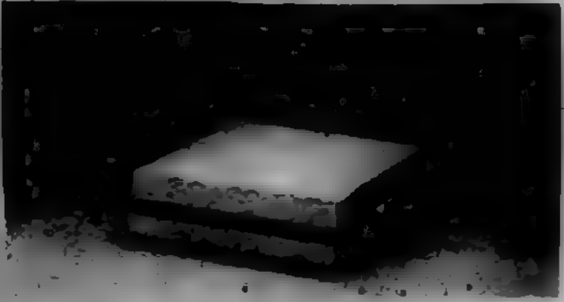
■

Diebold, Inc. announced revenue for the first quarter of $111 million, compared with $118 million for the same period last year. Profits were $10.4 million, or 80 cents per share, compared with $13.9 million, or $1.07 per share, in the same quarter last year.

■

Standard Register Co. reported revenue for the first quarter of $100.6 million, compared with $101.4 million in the comparable period one year ago. Profits were $7.5 million, or $1.13 per share, compared with $5.6 million, or 85 cents per share, one year ago.

THE NIU-130 LOWERS COST-PER-LOCATION.



Announcing the NIU-130: a two-port NIU that can follow you anywhere at a cost-per-location so reasonable that network connection is feasible where it hasn't been before—particularly in broadband applications. A one-person station on the production floor. An isolated office. A surveillance site.

The NIU-130 unplugs and moves with you easily, and is, like all Net/One products, media-independent.

It takes full advantage of VLSI as well as 16-bit architecture to do more than a single NIU has ever been able to do before. More features. Higher performance. At a cost that keeps the total system cost way down, even when you have to make connections way out.

Give us a call. Ungermann-Bass, Inc., 2560 Mission College Blvd., Santa Clara, CA 95050, (408) 496-0111. Western Region (408) 496-6464. Eastern Region (708) 448-1117. International Offices: Lausanne, Switzerland (021) 267733, Tokyo, Japan (03) 585-5485, Toronto, Canada (416) 494-4426.

HOME

from page 61

me a letter-quality printer and assured me that I would never find a complete system for $1,500.

So I left.

Next I journeyed to a Tandy Corp. store to look at Tandy's Model 1000. The IBM Personal Computer-compatible machine had a sales price of $1,100, which included software. My entrance interrupted a conversation between two salesmen. I waited until they finished before asking to look at a Model 1000. One salesman informed me that $2,300 would be needed to purchase a system with a letter-quality printer. I attempted to lower the sales price by stripping some components, such as taking 128K bytes of random-access memory rather than 256K bytes. The salesman handed me a brochure and told me I could find various prices in it.

So I left.

From Tandy I traveled to a store conducting a fire sale on Kaypro Corp. Model 2s, an 8-bit machine that ran Digital Research, Inc.'s CP/M operating system. Kaypro had previously announced an enhanced machine, the Model 2X. The company was left with a huge inventory of Model 2s, so its price had plummeted.

After I told a salesman what I was looking for, he tried to persuade me to purchase a Model 2X. He explained that for $1,000, I would get more software, two spreadsheets rather than one and a faster processor. Since I didn't even need one spreadsheet, the Model 2's lower price seemed like a much better feature.

My next stop was at a mass merchandiser that was supposedly carrying a Sanyo Business Systems Corp. system. A coworker had informed me that the $995 system ran most IBM software and included a functional word processing package. The machine sounded too good to be true, and it was: The store no longer carried it because the manufacturer had announced an enhanced model.

My search continued for a few more days as I visited or called a number of stores. At the end of the search, I was left with only one system, Kaypro 2, which met my needs and my price range.

The product included a number of shortcomings. First, Kaypro had abandoned the product and was pushing the enhanced model. Second, it would not surprise me if either Kaypro or the store selling its products soon went belly-up. Third, these days there is not much software being written for Digital Research's CP/M operating system. Despite these considerations, I bought the machine.

Gap in the market

My situation points to a gap in the market. For a few hundred dollars, one can purchase a system from Commodore Business Machines, Inc., but this type of system tends to be incomplete. As one adds in disk drives, software and other essentials, prices rapidly climb.

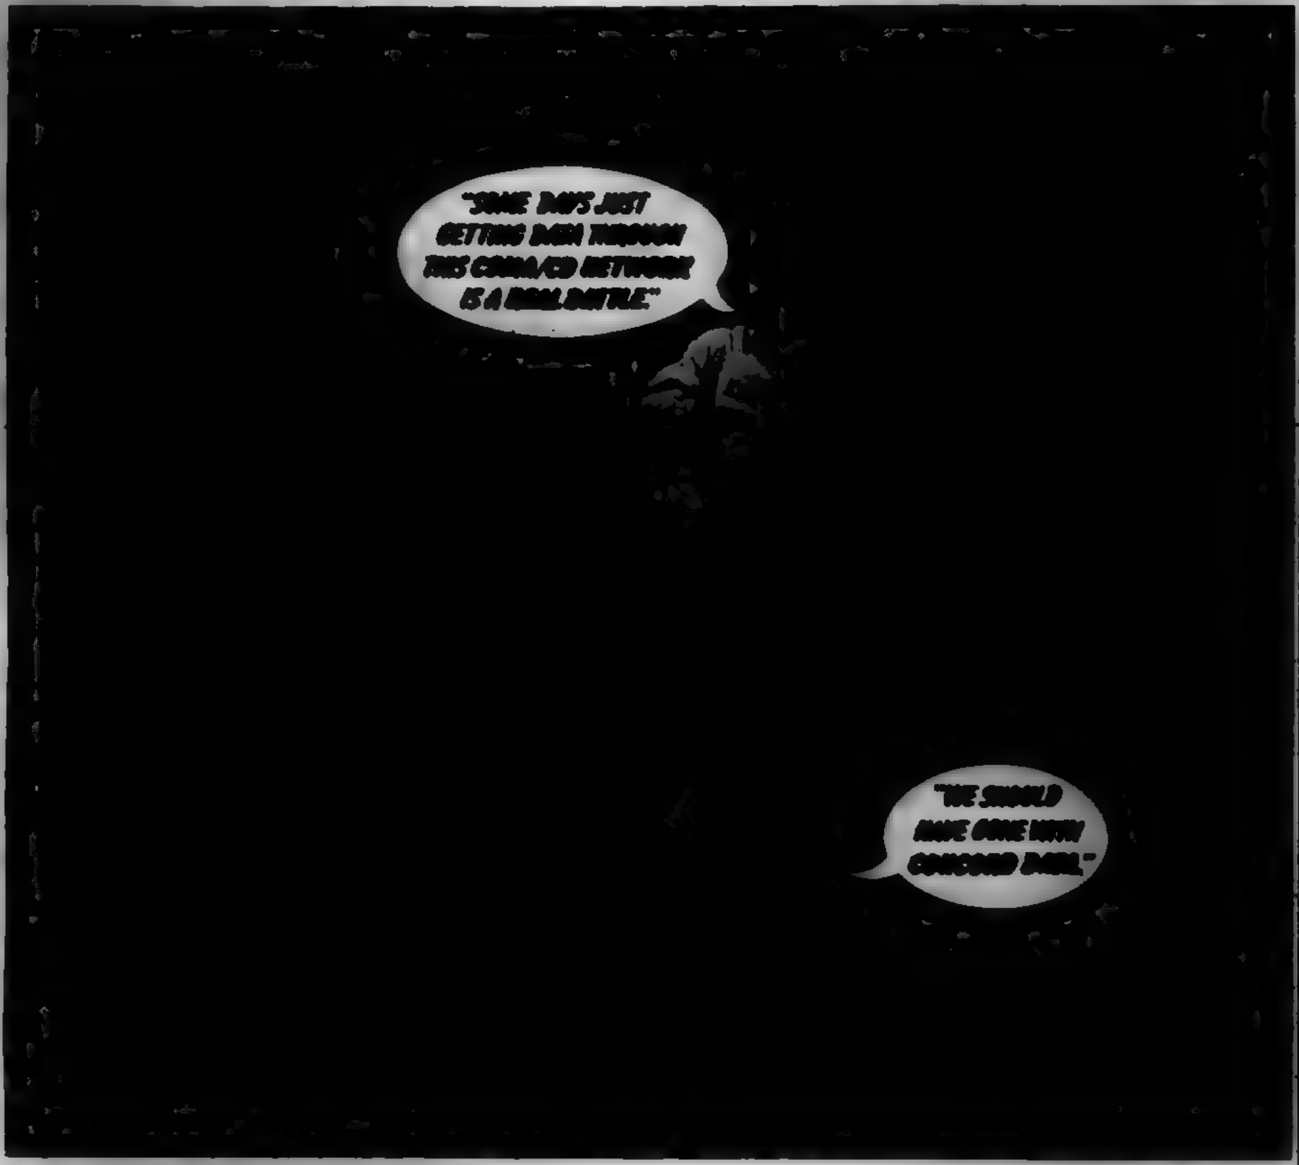
Prices for complete systems like the IBM Personal Computer start at $2,000. In between the two systems lies a black hole — and the bulk of the home market.

Without my prompting, at least four fellow employees told me they were also interested in purchasing a home computer and would spend about $1,500. They chose to wait until prices fall; I was the only one desperate enough to purchase a Kaypro.

There seems to be no logical reason why one can't find a complete system for $1,500. For $700, Coleco Industries, Inc. put together an almost complete system. Why can't another company put together a complete system for twice the price?

As I traveled to various stores the answer became clear. It lies in distribution channels: Retailers do not want to sell systems that cost less than $2,000, and manufacturers do not want to sell computers through mass merchandisers. Unless this problem is solved, home computer sales will remain sluggish.

"Sorry, we can't give you any money — our computer is down."



"SOME DAYS JUST GETTING DATA THROUGH THIS CSMA/CD NETWORK IS A REAL BATTLE."
"WE SHOULD HAVE GONE WITH CONCORD DATA."

Alonzo Chappel. Battle of Bunker Hill. Courtesy The Bettmann Archive.

There was a time when the data collisions common to CSMA/CD-type local area networks were a painful fact of life. But times have changed. Today our Token/Net™ IEEE-802.4 broadband bus network provides a high-capacity, high-volume LAN solution for virtually any communications requirement. Developed first for the factory, where predictable, error-free data control and transmission are critical, Token/Net has proven itself as the most suitable network for the *entire* business/manufacturing complex.

Token/Net operates over low-cost CATV cable with enough bandwidth to link literally thousands of data, voice, or video devices over distances to 25 miles. Token/Net's multi-port TIMs (Token/Net Interface Modules) implement the IEEE-802.4 token passing access method, giving all users network access free from data collisions. Sophisticated software, diagnostics and full-featured management options give network managers complete control over network activity. If you're up in arms over networking systems that fall short of your requirements, call us at (617) 890-1394 or write 303 Bear Hill Road, Waltham, MA 02154, telex 951793.

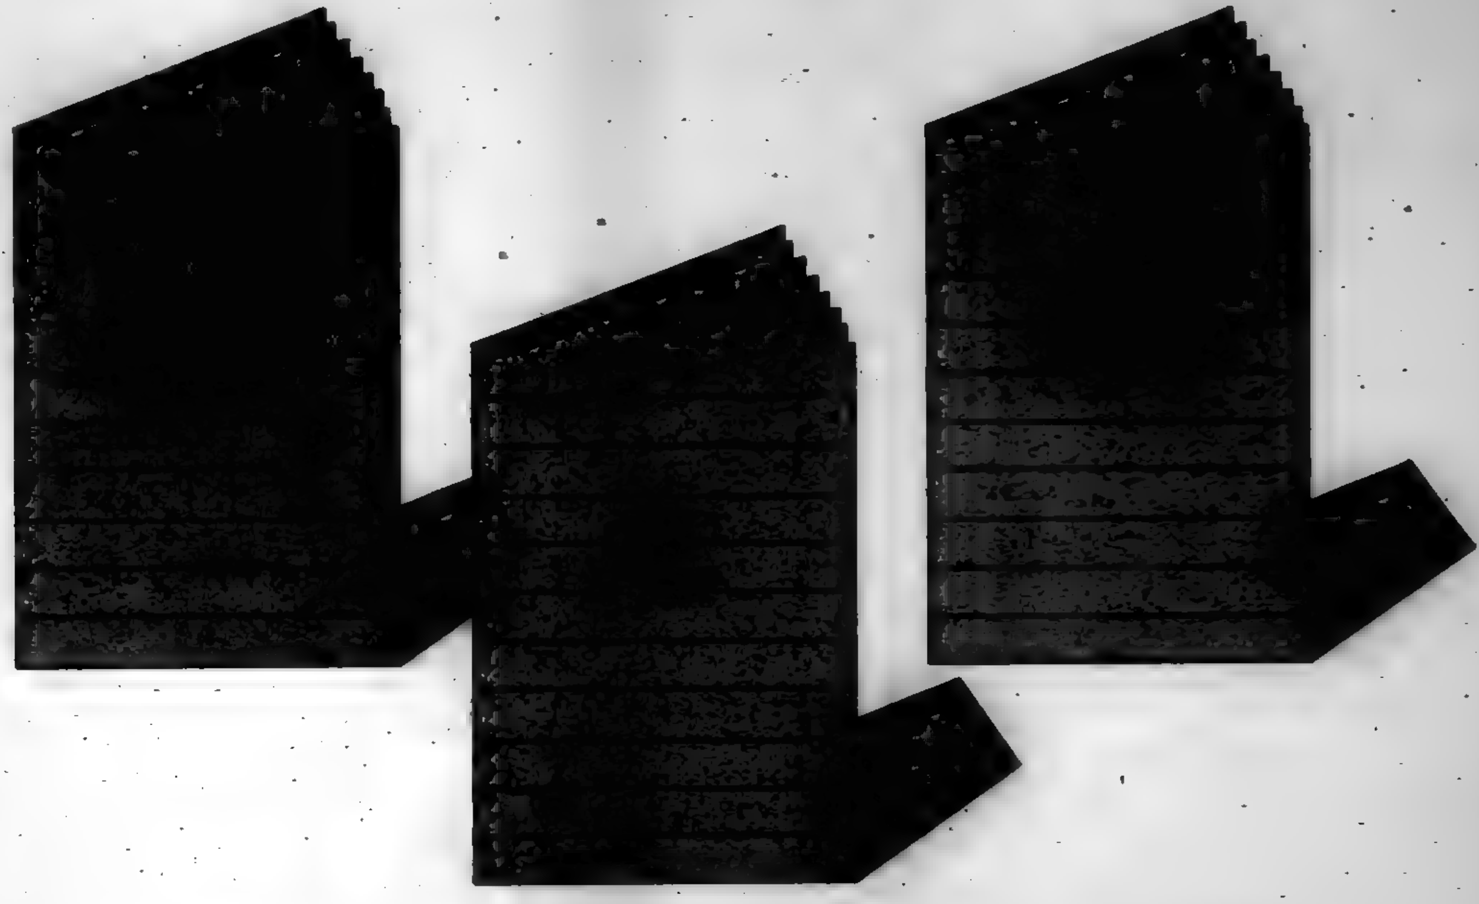
How to make NCC *really* work for you



Thousands of your customers and potential clients will go to NCC this summer (in Chicago, July 15-18). And hundreds of thousands more will follow the show by reading Computerworld.

We'll provide our readers with complete coverage of NCC in three special issues — the July 8th Preview issue, the July 15th Show issue, and the July 22nd Wrap-Up issue. Our editors will showcase the new products; report on the major speeches and seminars; and take a look at industry trends of interest to our readers.

Advertise in these issues now to keep your company and your products in front of more than 687,000 computer-involved professionals all during this eventful period.

And be sure to tell the attendees how to find you at the show. Advertise in Computerworld's *NCC Daily!* — NCC's most popular newspaper. We'll publish four separate daily issues, and distribute 25,000 copies each morning of the show. So you'll reach your target audience just as they're deciding which booths to visit.

Protect your investment in NCC. Call your local Computerworld representative today to reserve space for your NCC campaign. Or call Ed Marecki, National Sales Director, at (617) 879-0700. Call now. These issues will be closing soon:

Issue	NCC Preview	NCC Show	NCC Wrap-Up	NCC Daily!
Issue date	July 8	July 15	July 22	July 15,16,17,18
Color closing	June 21	June 28	July 5	June 10 (all 4 issues, BW or color)
Black & White closing	June 28	July 3	July 12

DEC exec joins Lisp

LOS ANGELES — Ward D. MacKenzie, former group vice-president of the OEM and business computer groups at Digital Equipment Corp., recently resigned to accept the post of chairman of the board and chief executive officer of Lisp Machines, Inc.

Lisp Machines founder F. Stephen Wyle, formerly chairman and chief executive officer of the company, was named vice-chairman. The appointment of MacKenzie to the position of chairman of the board and chief executive officer, Wyle said, "will allow me to concentrate on long-range business strategies as well as the entrepreneurial opportunities offered by the application of [the company's] technology in specific industry areas."

MacKenzie spent 18 years with DEC and was responsible for DEC's retargeting of its microcomputer products to vertical markets.

Named head of DEC's business computer group was John C. MacKeen, vice-president for OEM operations.

Computer brokerage firms merge

MEMPHIS — Ken Bouldin, president and chief executive officer of Economic Computer Sales, Inc. (Econocom), announced last month the merger of his company with ECS/CRS International, a company headquartered in Belgium.

The new company was named Econocom, the trade name used by Economic Computer Sales for 14 years. ECS/CRS was founded in 1973 by its current chairman, Jean-Louis Bouchard.

The two companies had conducted parallel corporate activities for the past 12 years, Bouldin said, and the merger possibilities had been considered for at least that long.

Both companies are engaged in sales and leasing of new and used computer equipment, brokerage of new and used computer equipment and additional services, including financing.

"We're very optimistic about the possibilities accompanying our entry into the global marketplace," Bouldin said. "Our combined strengths will make us a very formidable competitor in the international arena."

Company officials said they expect to have combined sales of $370 million this year and expect employment to grow from 427 employees worldwide to 700 by the end of the year.

GEISCO

from page 61

a strategy that is targeted to specific business thrusts," Williams said in a release detailing the layoff of Geisco personnel.

Last fall Geisco announced a wide array of business offerings designed to transform the company from a general-purpose computer processing business into a value-added communications enterprise.

In regard to its latest reorganization plan, Geisco said: "Specific application businesses that we will more aggressively target include office communications, automated clearinghouse services, supplier and dealer systems, international trade and a portfolio of electronic data interchange markets."

Damian Rinaldi, an analyst with International Data Corp. located in Framingham, Mass., said Geisco's moves are "consistent with the industry's efforts to restructure in the face of a stagnant market."

Edit IMS Data Bases On-Line Under TSO/ISPF?

ONSITE SERIES/1 EDX AND CF EDUCATION

For the benefit of those users who are unable to attend the standard Series/1 courses provided by IBM, SSCP is now offering a complete curriculum of Event Driven Executive (EDX) and Communications Facility (CF) education, conducted at your location according to your schedule. Now you can avoid the expense and inconvenience of sending your programming and project management staff offsite, while providing them with the best and most complete EDX and CF education available.

SSCP offers:

- Courses prepared by former IBM Series/1 education specialists
- Hands-on labs designed to help your Series/1 staff reach a high level of EDX and CF expertise quickly
- Classes ranging from basic operator training through advanced programming and systems internals workshops
- Reasonable rates

Small Systems Communications Products—Specializing in products and services for the IBM Series/1 and Personal Computers.

Norm Jones and Ed Kaczorowski have joined Lam Research Corp. Jones, formerly of Intel Corp., will fill the newly created post of senior vice-president of process technology and marketing. Kaczorowski, formerly of Zylin Corp., will be director of electrical engineering.

■

Storage Technology Corp. has announced the following appointments: Robert G. Costain to the newly created post of corporate vice-president of strategic planning and Carl E. Vertuen Jr. to corporate treasurer.

■

Thomas M. Coccione has been appointed president and chief executive officer of Applied Computer Sciences, Inc. Prior to joining Applied Computer Sciences, Coccione worked for IBM and Management Science America, Inc.

■

Southern New England Telephone Co. announced the appointment of Walter H. Monteith Jr. to the position of chairman, president and chief executive officer, effective July 1. Alfred W. VanSinderen, current chairman, will retire from the company but will remain a director.

■

Data Group Corp. has appointed Alan F. Atkinson to the position of president and chief executive officer. Most recently Atkinson was vice-president of the small-computer marketing operations at Honeywell Information Systems. Prior to that he spent 16 years at IBM in a variety of management positions.

■

Image Peripherals, Inc. has announced the appointment of Louis G. Orsatti as president and chief executive officer. Most recently Orsatti has served as vice-president and general manager of the data terminal systems division of Datachecker/DTS, a wholly owned subsidiary of National Semiconductor Corp. He has also held positions at Mohawk Data Sciences Corp. and Univac, a division of Sperry Corp.

■

Edmund B. Fitzgerald has been named chairman of the board of Northern Telecom Ltd., succeeding Walter F. Light who is retiring after more than a decade at Northern Telecom. Fitzgerald will retain his current responsibilities as chief executive officer and president.

■

Raymond A. Gates has resigned as president and chief executive officer of Panasonic Co., a division of Matsushita Electric Corp. of America (Meca). Gates will continue to serve Meca as senior advisor. Kiyoshi Seki, president and chief executive officer of Meca will concurrently assume the position of president of Panasonic.

■

AVL has announced the appointment of Raymond V. Searl as president and chief executive officer.

■

Aardvark Systems and Programming, Inc. has announced the appointment of Howard Karvel as president. He succeeds Thomas E. O'Donahue, who becomes chairman.

APPLE

from page 61

troduced in October, the device has been delayed, if not killed.

Granted, the XL was simply a renamed Lisa filling an understudy role until a new star, still apparently in the wings, could step in. Likewise, Apple planned right from the start that third-party vendors would be developing their own versions of file servers for the Macintosh Office.

But in this business, unfortunately perhaps, symbols play a large role, and the scheduled retirement of the XL and apparent scrapping of the Apple file server have removed two key symbols from the Macintosh Office lineup.

Some other symbols to consider are the following: The Macintosh Office failed to make an appearance at OAC '85 earlier this year; and Apple said it will not attend the National Computer Conference this summer. The company, while dependent on dealer sales, didn't even make it to Comdex/Spring '85, the jewel in the crown of the dealer empire, although the company traditionally skips the spring confab in favor of the fall one.

Must contain expenses

In light of the company's recent projections that third-quarter profits will fall below the $10 million posted in the second quarter, it is obvious Apple must contain expenses. In retrospect, expensive ventures into Super Bowl advertising and single-advertiser issues of *Newsweek* were obviously too extravagant, although the decisions were made when projections for micro sales were still in the stratosphere.

Cost cutting is one thing — and all too often companies fail to make the hard decisions until it is too late — but Apple seems to be pulling the legs from under its campaign for the future: namely, becoming a large force in small- to medium-size companies and establishing a viable presence in the Fortune 1,000.

The company also recently indicated it is practically abandoning its direct national sales force. Although that sales force of some 60 people was abysmally small, it was yet another symbol of Apple's willingness to play in the big leagues.

By reigning in advertising, marketing and production, it can hunker down in its relatively debt-free harbor. But the trade-off is that it loses momentum. As Apple's sloop anchors to wait out the storm, the IBM battleship races ahead of the winds.

Each day that Apple hesitates, it falls behind the pace that IBM is setting with its impressive array of micro products.

Perhaps it is time for Apple and the rest of us to concede that, as unappealing as it may be, America's big business is wedded to Big Blue for better or worse. IBM effectively controls computing at that level through its unyielding dominance of data processing.

Whether or not Apple is willing to change its strategy yet again, the company must come to some decision about where it wants to go. On-again, off-again campaigns are the hallmarks of losers.

***The Asian Computerworld* reaches the fastest growing computer market in the world.**

Introducing
The Asian Computerworld

The Asian Computerworld is Computerworld's sister publication covering the South East Asian marketplace. The English fortnightly tabloid keeps company executives, computer users, potential users and people in the computer industry up-to-date.

South East Asia is considered the fastest growing computer market in the world with a total value of $1.8 billion and annual growth rates for small business systems and micros over 50%. The average annual growth rate is approximately 30%.

The Asian Computerworld, with a total circulation of 10,000, is published in Singapore and printed every alternate Monday. Distribution of the newspaper covers Brunei, Hong Kong, Singapore, the Philippines, Malaysia, Indonesia and Thailand.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *The Asian Computerworld*, just fill out and return the coupon below.

POSITION ANNOUNCEMENTS

HUGHES

THE PEOPLE BEHIND MANAGEMENT SYSTEMS

Hughes Space and Communications Group, the people responsible for over two-thirds of the world's commercial communications satellites, is also instrumental in the development of advanced systems applications.

You can join this team of MIS specialists and enjoy unique career challenge as well as the diverse Southern California lifestyle. Consider your potential in the following assignments:

Database Administrator

You will assist application development teams using IDMS. You will be responsible for creating logical IDMS database designs, transforming them to physical databases and running schemes, subschemes and DMCL compilers. In addition, you will define and recommend database standards and procedures, review application design and programs for compliance and make necessary modifications. We prefer candidates with a BS in Computer Science or equivalent plus experience in data processing including prior IDMS experience.

IDMS Applications Programmers

Responding to our users needs and assisting the development of application products, you will work extensively with specialized development tools and with IDMS-DC, ADS-O, ADS-A, and ASF. Our preferred candidates for these positions will have at least one year of programming experience using IDMS.

IDMS Trainer

We seek a designer/deliverer of IDMS training to assist our users and internal support professionals with the group's automated business systems tools.

Our preferred candidate will have a Bachelor's degree and several years of directly related experience, including exposure to the aerospace industry and knowledge of business applications, training delivery media and training methodologies.

Programmers

You will provide technical support to application development programmers. Implementing IBM PC local area network, you will support users and clerical staff with on-line and database systems running on IBM 3084. You will also be involved with Assembler language for IBM users in the technical support area.

We prefer individuals with a related college degree and at least 3-4 years experience. Your background should include knowledge of TSO, SSF, JCL, COBOL, Assembly language and IBM utilities. Good communication skills are essential.

Hughes offers a highly competitive salary and an outstanding benefits package that includes medical, dental and vision-care coverage for you and your eligible dependents.

For immediate consideration, please send your resume to: Judy Jones, Professional Employment, Hughes Space & Communications, S41/A300, Dept. 664, P.O. Box 92919, Los Angeles, CA 90009. Proof of U.S. Citizenship Required. Equal Opportunity Employer.

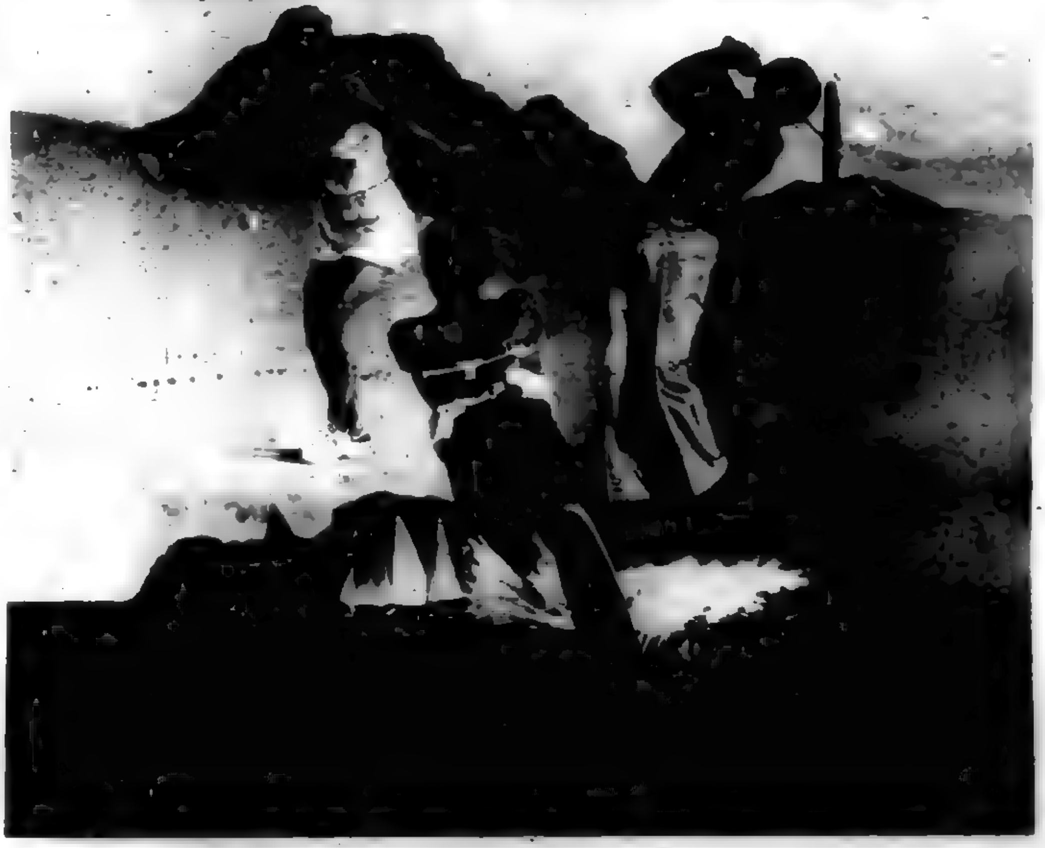
COMPUTER PROFESSIONALS



As a major water and power utility in Arizona, maintaining top performance depends on our state-of-the-art computer technology. That's why we use sophisticated computer systems like the IBM 3084, IBM 3033, with MVS/XA, VM, CICS, IMS and dual IBM 3800 M3's. Add to this our extensive on-line system of PC's and terminal/printer network, and the IBM 4381's that are used to support Distributed Data Processing. Our operating environment includes TSO/SPF, VM/CMS, 4 GL support development tools, and COBOL, along with a wide variety of structured methods.

If you have a degree in Computer Science, Business Management or Mathematics you owe it to yourself to talk to SRP. We're especially interested in speaking to computer professionals with at least 2 years of experience to fill these positions:

- DP TECHNICAL WRITERS
- DATA BASE ADMINISTRATORS
- DATA ANALYSTS/DATA MANAGER DICTIONARY
- COMPUTER OPERATORS
- DATA MODELER
- PROGRAMMER ANALYSTS
- COMPUTER OPERATIONS ANALYSTS
- SYSTEMS PROGRAMMERS
- RESOURCE PLANNERS
- A VARIETY OF OTHER COMPUTER SPECIALISTS

SRP is talking your language! And, we can offer you the opportunity to work in a state-of-the-art IBM environment with top professionals in your field. Learn more about the unlimited recreational and cultural attractions of Phoenix, Arizona and our excellent compensation and benefits program. Send your resume and salary history to: S. Kranioz, Salt River Project, Dept. CW603, P.O. Box 52025, Phoenix, AZ 85072-2025.

COASTAL MAINE

Due to continued growth, Hannaford Bros. Co., northern New England's largest food retailer has the following positions available:

SYSTEMS ANALYST

We are looking for a data processing professional to meet with user department managers and staff members to analyze the feasibility of developing solutions to their business problems. This person will prepare preliminary system studies documenting the problems, outlining alternative solutions and recommending approaches including cost benefits analyses.

To qualify for consideration, candidates should have seven years data processing experience or five years experience combined with a bachelors degree. Excellent verbal and written communication skills, as well as successful project leadership experience, are required.

LEAD PROGRAMMER

The professional we seek will direct the programming efforts of a project team in the development of business applications. This individual will code complex programs, and develop program specifications from which state-of-the-art programs can be written, while serving as a technical resource for other members of the Systems and Programming Department.

To be considered for this position, the candidate must have a minimum of three years structured COBOL programming experience, project leadership and strong communication skills. Preference will be given to individuals with CICS and IDMS experience.

For these positions, Hannaford offers attractive starting salaries along with a competitive flexible benefit package, which includes a 401K savings program and relocation assistance.

To be considered for either of these positions, qualified candidates must send a complete resume and salary history to:

Robert F. Hodges
HANNAFORD BROS. CO.

To assume responsibility for supervision of day to day support service to college administrative offices. [illegible] by June 24, 1985 to Director of Computing Services, State University College at Fredonia, Fredonia, NY 14063. SUNY Fredonia is an Equal Opportunity/Affirmative Action Employer.

OVER 600,000 CHANCES TO WIN!

Hiring a new employee is always a bit of a gamble, but when you advertise your job openings in Computerworld's classified pages the odds are on your side.

In every major market, Computerworld reaches more data-processing professionals than the local recruitment media. And we reach them for less. Consider the facts:

1. More than 600,000 computer-involved professionals receive Computerworld every week. That's more than any other trade journal, business publication, or general magazine.

2. Our readers are the very people you're looking for. MIS/DP directors, systems analysts, programmers, and engineers — as well as presidents, treasurers, and general managers.

3. Computerworld delivers quality readership. Fully 41% of our subscribers read Computerworld's recruitment section weekly. And 95% of our subscribers read this section regularly.

When you compare costs and the people reached, Computerworld is the number one medium for computer-related recruitment advertising. Place your ads today. You'll get the responses you're looking for. And you'll get them fast, because we accept ad materials up to 10 days before the issue date.

Simply call toll-free (800) 343-6474. In Massachusetts call (617) 879-0700. Call now. And don't forget to ask for a copy of our "1985 Quick Reference Rate Card." Or write Computerworld, Box 880, 375 Cochituate Road, Framingham, MA 01701.

IBM EQUIPMENT SALES OPPORTUNITY

CENTRON DPL COMPANY, INC.

The National Computer Conference is the biggest and most important conference in the world and it is going to be held July 15th-18th, in Chicago, Illinois this year! The NCC issues will have a readership of over 600,000 readers. This could be one of your smartest advertising moves of the year. Computerworld is giving you the opportunity to reach the show's attendees.

PREVIEW - July 8th .... SHOW - July 15th .... WRAP-UP - July 22nd

Our open line rate is $10.35 per line and the minimum ad size is 2 column inches (1 column x 2" at a price of $289.80). We are $144.90 per column inch. Send us camera-ready copy (negative or velox) or copy to be typeset by us at no extra charge. Enclose any logos, artwork, or borders that you want to use in your ad. We also have a team of ad takers that will accept simple copy over the telephone.

SCIENTIFIC PROGRAMMER ANALYST and PROGRAMMER

...Merck Sharp & Dohme Research Laboratories, a world leader in the development of pharmaceutical and biological products, is currently offering challenging career paths to qualified professionals.

SCIENTIFIC PROGRAMMER ANALYST—The incumbent would serve as the Systems Manager for the Department of Immunology and Inflammation's new computer facility. This system is based on two HP 9000 CPU's and will be utilized for data gathering, scientific analysis, data base and word processing applications by the entire scientific staff. In addition, the individual will be responsible for electronics and software aspects of the Fluorescence Activated Cell Sorter (FACS).

Candidates must have a B.S. or M.S. or equivalent in computer science or programming. A background in the Biological Sciences is desirable as well as experience in programming.

PROGRAMMER—The position entails the development and implementation of programs through languages such as INQUIRE and SAS. The incumbent develops computer programs from specifications or user instructions and performs all phases of program development as well as providing mechanical guidance and training to the user community.

Candidates must have B.S. or M.S. or equivalent experience in computer science and 1-3 years programming experience. A background in the Biological Sciences is desirable as well as experience in SAS and/or INQUIRE.

We are located in Rahway, NJ, just 25 miles southwest of New York City. Our salary, benefits and career growth potential are excellent. To be considered, send your resume to:

Mr. Luis F. Ballester
Assistant Personnel Manager

Merck Sharp & Dohme Research Laboratories
P.O. Box 2000, Rahway, NJ 07065
EEO / AA / VH / EMPLOYER

MERCK & CO., INC.

DIRECTOR OF HOSPITAL INFORMATION SYSTEMS

In Louisville, Kentucky, health care is a major product. We are a PROGRESSIVE 300 plus bed hospital with an IMMEDIATE opening for a Director of our MIS department reporting directly to the President. Initial responsibilities will include conversion of existing systems to an IBM system 38/[illegible] environment. Rapid advancement opportunities exists for the degreed professional with strong management and health care experience. Excellent benefits and relocation package; salary commensurate with experience and qualifications. Your resume will be considered in strict confidence when submitted to:

Office of the President
P.O. Box 2161
Louisville, Kentucky 40201

COMPUTER PERFORMANCE EVALUATION

Multiple openings from California to New Jersey for qualified MVS performance analysts and capacity planners. Minimum 1 year experience required. Desirable skills include knowledge of MVS, performance tools such as RMF, OCM, MICS, BEST-1, TSOMON. Call or send resume to: Marilyn Kanes, a nationally known CPE professional.

Allentown, PA 18105
Equal Opportunity Employer, M/F

DIRECTOR OF ACADEMIC COMPUTING

San Joaquin Delta College is seeking candidates for this newly created position, which reports to the Associate Dean for computer services, and is responsible for the primary leadership role in the development of academic computing. Candidates must have at least a Master's degree in Computer Science, Mathematics or Business Administration or possess a Master's degree in any other field with evidence of [illegible]. A minimum of 3 years instructional experience plus 2 years of professional experience with computer applications in an educational [illegible]. Knowledge of [illegible]. Salary range is [illegible] to [illegible]. Excellent fringe benefits. Please send letter of application, resume, official transcripts and 3 letters of recommendation postmarked no later than June 14, 1985 to San Joaquin Delta College, Personnel Office, 5151 Pacific Ave., Stockton, CA [illegible]. Affirmative Action/Equal Opportunity Employer

---

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if . . .

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work.
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply CICS experience and for persons to apply MVS/XA knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE
- **System Software Analyst—MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion/activity for MVS/XA.
- **Senior System Software Analyst—CICS**
  Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Central and South West Corporation
P.O. Box [illegible] - Dallas, Texas [illegible]

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $3 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 126,000 this fall. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read. It offers classifications to solve a variety of problems: Position Announcements, Positions Wanted, Buy • Sell • Swap, Software For Sale, Software Wanted, Time & Services, Real Estate, Publications, Bids & Proposals, Auctions, Seminars & Conferences and The Bulletin Board.

Our **BULLETIN BOARD** section is ideal for the smaller companies who want a low-cost way to sell pieces of equipment (hardware or software). The **BULLETIN BOARD** is laid out as a quick reference for potential buyers who know what they are after.

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

A number of special issues of COMPUTERWORLD are scheduled to run in 1985. Each of these issues will feature one aspect of the computer industry and give our advertisers a chance to reach a more select audience. These are some of the topics the issues will cover:

- June 24 - **DBMS**
- July 8 - **NCC Preview**
- July 15 - **NCC Show (early close July 3rd)**
- July 22 - **NCC Wrap-Up**
- August 26 - **Software Productivity Packages**
- September 30 - **Minis & Small Business Systems**
- October 28 - **Data Communications Terminals**
- November 25 - **Protecting The Corporate Information Resource**
- December 30, 1985 & January 6, 1986 - **Forecast '86**

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubset or camera-ready material (velox or negative) via the mail. We provide telecopier service and will also take ads over the phone.

Information concerning classified advertising rates, color costs, ad sizes, mechanical specifications along with more detailed information on the special issues is contained in the 1985 Rate Card #20 and Media Kit. Or from our offices.

Our mailing address is COMPUTERWORLD, Classified Advertising, 375 Cochituate Road, Box 880, Framingham, MA 01701. Or call for more information at 1-800-343-6474 or, in Massachusetts, (617) 879-0700

The above information is intended as a guideline for computer users on relative computer system instruction cycle times. All data have been derived from published documentation and represent reasonable estimates of average MIPS ratings. However, Randolph is not responsible for the accuracy of the MIPS data. Cycle times will vary based on hardware/software configurations, and system manufacturers continually modify computer models as design improvements in hardware and software arise.

TALK TO RANDOLPH NOW. Whatever your computer system needs, Randolph can deliver the hardware when you need it...and ease the pressure on your DP budget with low lease rates. Call William Rooney, Vice President, 800-243-5307, in CT (203) 661-4200.

BIDS & PROPOSALS

NOTICE TO POTENTIAL VENDORS

Notice is hereby given that the New Mexico Educational Assistance Foundation will receive proposals for an automated system for:

STUDENT LOAN PROCESSING ACCOUNTING

Each proposal shall be in accordance with the Request for Proposals on file at New Mexico Educational Assistance Foundation, [illegible] Yale Boulevard, S. E., Building F, Albuquerque, New Mexico 87106, where copies may be obtained. Each proposal shall be in the format specified in the RFP, shall be sealed and filed with the New Mexico Educational Assistance Foundation, 3900 Osuna Road, N.E., P.O. Box 27020, Albuquerque, New Mexico 87125, on or before July 5, 1985, at 5:00 p.m. The proposals will be opened at 5:00 p.m. on July 5, 1985 at the Foundation.

A performance bond of 10 percent may be required from selected finalist vendors as a guarantee that the successful vendor will enter into a contract and will be declared forfeited if the successful vendor refuses to enter into said contract. The successful vendor will be required to furnish a performance bond in an amount equal to 100 percent of the contract price. These bonds are to be secured from a surety company satisfactory to the Foundation.

The Foundation reserves the right to accept or to reject any and all proposals in whole or in part and/or waive any irregularity in any proposals received, and to be the sole judge of the suitability of the supplies, equipment and services offered. No vendor may withdraw his proposal for a period of one hundred and twenty days (120) days after the date set for opening. Be advised that a pre-proposal Vendors' Conference will be conducted on June 14, 1985 at 1:00 p.m. at the New Mexico Educational Assistance Foundation, 3900 Osuna Road, N.E., Albuquerque, New Mexico 87125, to respond to any questions which potential vendors may have concerning the Request for Proposals.

SYSTEM/38 AND HFA HANDLE HIGH VOLUMES

HFA is a fully integrated, native 38 system that handles high volume processing requirements. Our software package includes:

- Accounts Receivable & Credit
- Accounts Payable
- General Ledger
- Customer Order Entry
- Inventory Management
- Engineering Records
- Purchasing & Receiving
- MRP & CRP
- Manufacturing Control
- Payroll

Call or write today for more information on how HFA can help you.

OF THE BIG THREE IN BUSINESS SOFTWARE TODAY, WHO'LL BE ON TOP TOMORROW?

If you look at the big three, you see that each of us has a fast growth rate, and each claims to have "total-solution" software. A multiplicity of packages that give you complete mainframe capability, plus a PC link.

But whose total solution is best? If you agree that success is the reward for a job well done, you may agree with the prediction we make at McCormack & Dodge.

The company that's on top tomorrow will be the company that's on top of your business problems today. With the solutions that are easiest to apply—the solutions that promise the fewest future headaches.

When you're talking "total solution," this can mean only one thing. The product line that works best as a totality will be the easiest and most effective for all parties. User and vendor alike.

We believe your own analysis will quickly point out which of the big three has the most integrated family of products. Even though all three claim total integration.

We believe you'll find that two companies offer the mere appearance of integration. An agglomeration of business applications linked superficially, through hinges, patches, shadow files and masks.

While one offers the real thing. Millennium. A true family of business software in which the whole works as smoothly as any part. In which every package has the same query mechanism, the same report writers, the same screen generation, the same on-line documentation, security and real-time capabilities. So that when the packages are put together, there are absolutely no borders between them. They fit like pieces in a jigsaw puzzle. Making the most efficient use of all your data processing resources.

There's even a Millennium application development tool, so you can create new systems as you need them. Without slow, expensive programming.

Of the big three in software today, who'll be on top tomorrow?

Don't stop asking until you know.

Third-party service gains users' favor

By Jeffry Beeler
CW West Coast Bureau

Manufacturer service organizations, beware.

Systems users, take note.

After years of being widely perceived as the service field's poor relations, third-party maintenance companies are gaining respect.

PRODUCT SPOTLIGHT

The firms' newfound professionalism is evident in the quality of their customer service, which has recently shown strong signs of improving. The advances are not confined to one or two key measures of effectiveness. On the contrary, third-party maintenance providers have elevated their performance levels across the board, according to Rebecca Segal, a research analyst with Framingham, Mass.-based International Data Corp.

Segal based her conclusion on the results of a recent IDC survey in which users of vendor-supplied and independent maintenance were asked to rate the quality of their systems support. In general, the third-party providers were rated quite favorably compared with their manufacturer counterparts (see charts page 16).

Between 1983 and 1984, "the improvements in the service delivered from third-party firms [were] tremendous," the study concluded. In nine of the 11 performance categories that IDC asked customers to examine, the independent companies' scores in 1984 rose 0.6 of a point or more (on a rating scale of one to five) over their respective 1983 levels.

Moreover, in four of IDC's measures of service quality, the user evaluations of third-party maintenance jumped 0.9 of a point or more between 1983 and 1984. The study called the independent firms' strides "unbelievable."

"When any industry shows improvements of [0.9 of a point] . . . in one year, the competition must sit up and take notice, especially with independents targeting their markets," the researchers reported.

Although manufacturers as a whole still apparently hold an edge in some key service criteria like response time, third-party providers are clearly narrowing the gap in performance. In the process, independents have finally begun to shed their country cousin image and are increasingly forcing customers to reassess their longstanding doubts about the effectiveness of independent maintenance.

Probably nowhere is the third-party sector's growing stature among users more clearly demonstrated than in the recent findings of D. Roger MacNaughton, president of Franklin Lakes, N.J.-based Business Development International, Inc. As part of a report for Frost & Sullivan, Inc., a New York-based research firm, MacNaughton recently asked 2,000 MIS man-

CAI targets data center

System links software for managing DP shop

By John Gallant
CW Staff

JERICHO, N.Y. — Computer Associates International, Inc. is expected today to take aim at what may be the least automated bastion of the corporate world — the data center.

The systems software vendor will introduce a fully automated data center management system for IBM MVS environments that integrates 13 of CAI's systems offerings; a microcomputer- and mainframe-based service, support and training system; and on-line software that automates product installation and maintenance.

In a demonstration last week, CAI unveiled the automated CA-Unicenter, which features the following key components:

■ Data center management software consisting of integrated productivity packages for programmers and operations per-

Losses press Wang to lay off 1,600

By Peter Bartolik
CW Staff

LOWELL, Mass. — Anticipating its first quarterly loss since 1973, Wang Laboratories, Inc. last week dramatically accelerated its cost-cutting campaign by announcing it is laying off 1,600 employees across the board in U.S. operations and freezing salaries for six months.

One year after cresting above the $2 billion revenue mark, Wang expects to post a fourth-quarter loss for the period ending June 30, although the company said it expects to report a profit for the fiscal year. In the fourth quarter of fiscal 1984, Wang posted its highest quarterly profit ever — $73.7 million. In the third quarter of the current fiscal year, profits slumped to $17 million.

The declining sales problem that has stymied the company in the current calendar year has resulted in accumulations of inventory that will require Wang to write down the value of that inventory at the

Death, taxes . . . and software maintenance. In the DP world, maintenance is an unavoidable need, although it is not always treated with due respect, said maintenance expert Nicholas Zvegintzov in a *Computerworld* interview. **Page 47.**

Cray-2 Unix supercomputer out

By Tom Henkel
CW Staff

MINNEAPOLIS — Cray Research, Inc. last week formally announced the Cray-2, a $17.6 million, AT&T Unix-based supercomputer that is said to deliver six to 12 times the performance of the company's first product, the Cray-1, while occupying about half the floor space of the more recent Cray X-MP.

The brainchild of inventor Seymour Cray, the Cray-2 appears to be the company's attempt to fend off intense competition from Japanese computer manufacturers to offer the fastest computer system in the world.

Cray users viewed the Cray-2 introduction as an attractively priced system that will have the most appeal to supercomputer users operating with large data bases. The adoption of Unix by Cray was

Crime survey indicts 'insiders'

By John Desmond
CW Staff

PARK RIDGE, Ill. — Company insiders commit far more computer crimes than outsiders do. Few computer crimes are reported to authorities. And fewer than half of all companies have part- or full-time staffs devoted to system security.

Those were the key findings of a survey of Data Processing Management Association (DPMA) members conducted by Detmar Straub of the management information services program at Indiana University, Bloomington, Ind.

Of 170 survey respondents, 21% reported that one or more system abuses occurred in the past three years in which the perpetrator was known. Of these, 2% were committed by outsiders. Individuals who committed inside abuses were programmers, systems analysts, machine operators and data entry clerks. Respondents were from companies in the fields of finance, retail and wholesale trade and education.

Suspected abuses

The total number of suspected abuses for which the victims had little or no knowledge of the perpetrator was "significant," Straub said. Some companies reported hundreds of suspected abuses, some dozens and some none, he said.

The largest category of computer abuse was misuse of computer services, reported by 49%. Of those, 42% involved unauthorized use and 7% involved disruption of services, such as bringing down the system. One programmer was using the company mainframe to run a mail-order business, complete with label printing. The company detected the abuse two years after it began and estimated its loss of the programmer's time at $20,000 to $30,000, Straub said.

Many examples were reported of DP employees using company systems to do programming assignments for night-school courses, which Straub called a petty abuse.

The respondents described 56 abuses, only 2% of which were reported to police or other authorities. Companies are reluctant to report such abuses because of embarrassment, fear of bad publicity or a disinclination to prosecute and pay legal fees, Straub said. "Banks are required by law to report material losses, but many of them are not doing that," he said, noting that many unreported abuses at banks involved significant dollar losses.

Program abuse was reported by 24% of respondents, data abuse by 22% and hardware abuse by 5%.

Several respondents reported the presence of tapeworm programs — code that runs whenever a system is brought up and is discovered only when it purges itself. In one incident of program abuse, when a company terminated an employee suspected of wrongdoing, the employee went to his terminal in an attempt to activate a tapeworm program. Luckily for the company, the system was down at the time. The company discovered that the tapeworm program would have erased the code that the employee used to skim $100,000 in funds into his own account.

Only 45% of respondents said they employ a data security staff. Many reported that abuses were detected by accident, rather than by auditors or security officers.

No distinct profile of a computer abuser emerged from the survey. DP managers, answering the survey as victims, reported that 27% of perpetrators acted out of ignorance of proper professional conduct, 26% out of misguided playfulness, 25% out of personal gain and 22% out of maliciousness or revenge. The DP executives said much of the unauthorized use arose from employees who used corporate information resources as personal property, in violation of company policy.

The DP managers said corporate personal computers are the biggest threat to their system security. Many said they fear users will download sensitive company data onto diskettes, according to Straub. One manager reported having nightmares of personal computer users walking out with strategic data, he said. Other respondents reported incidents of diskette theft and software copying.

Straub, a doctoral candidate in computer science in the university's Graduate School of Business Administration, said the DPMA survey is a pilot for a larger validated survey he is planning with a sample of up to 1,000 managers. "We need to have a sense of how big the problem is, and we need to identify ways to control the problem," he said.

Sortland Yard warns against "Raffles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

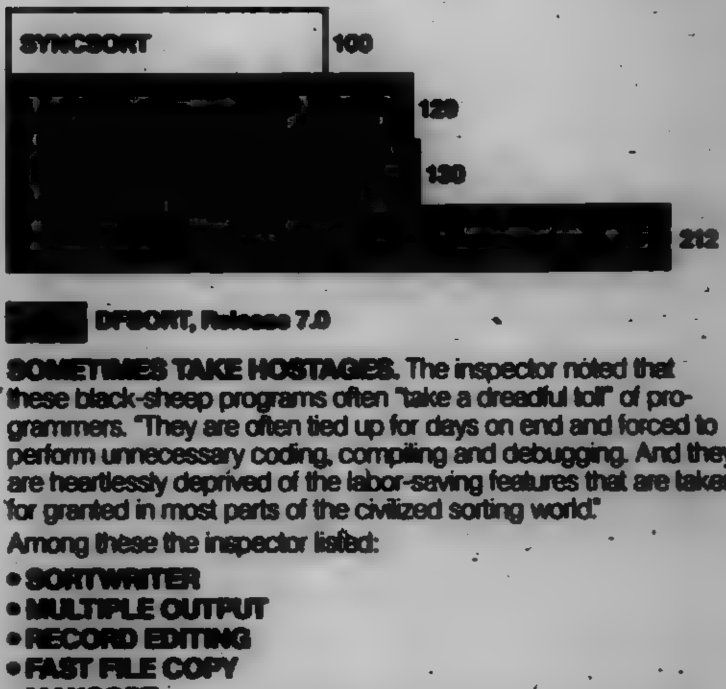
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied. "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

Kinney revamps data collection to fit managers' needs

By Charles Babcock
CW New York Bureau

HARRISBURG, Pa. — At the start of work Monday morning, executives of the Kinney Shoe Corp. in New York are finding a report on their desks that had not been there before.

It lists the previous week's sales and compares them with sales figures from the same week a year ago and with budget projections, according to Kinney management information systems administrators here.

"It's the report card for our business. It tells us how we did for the week in our stores," said Philip W. Richards, senior vice-president for finance at Kinney Shoe. Kinney executives used to get the same information two days later, but it appeared via a ponderous, store-by-store reporting system, he said.

Former system

The former reporting system required store managers to report up the chain of command. It allowed eight divisions of Kinney Shoe to state their sales eight ways, making it difficult to compare results. And since some people need information for merchandising or inventory rather than sales, much of the same data was collected at different points and entered into the system more than once, MIS officials said.

The current management report is one result of Kinney Shoe's reorganization of its data collection. Instead of a bottom-up method, Kinney Shoe collects the data it wants at the point-of-sale terminal in each store and transmits raw data from 3,111 stores into its data processing center here, known as the Kinney Service Corp. It can then extract the information it needs for top-down reports as well as use it as grist for its regular batch processing, Kinney MIS administrators said.

"We are now stepping back and viewing the flow of data purely from an information processing point of view," said Richard H. McMichael, vice-president and director of MIS for Kinney Service.

Although he is part of Kinney Shoe, McMichael reports directly to executives at Kinney's parent corporation, the F. W. Woolworth Co. in New York, which is interested in consolidating management information in its other subsidiaries, Richards said.

Getting the sales report out two days earlier is not the sort of achievement that changes the course of the business, McMichael concedes, but it has made an impact on one group. District managers receive the week's results at 11 a.m. Sunday over portable teletype units. A quick review of the previous week can help them adjust their plans, he noted.

In addition, McMichael's staff can respond to executives' requests for special information and add it to the regular report — given a week's advance notice.

> ***'We are now stepping back and viewing the flow of data purely from an information processing point of view.'***
>
> **— Richard H. McMichael**
> **Kinney Service Corp.**

If executives are visiting the West Coast, they may want to know how Kinney Shoe stores did in the Los Angeles basin. If an advertising campaign began on the East Coast, they may want to compare sales there with those in the Midwest, said Fred E. Ream, assistant director and applications development manager.

Work on innovative use of information

More innovative uses of management information are in the offing, the Kinney officials said.

"We are looking at inventory processing at the point of sale," Ream said, and store managers would like to see computerized transfer vouchers that would allow quick transfer of goods from a store where they were not selling well to one where they were.

One of Kinney Shoe's hot sellers is a boot worn on stage and promoted by country western singer Barbara Mandrell. After a Mandrell appearance, Kinney may want to transfer boots from Lancaster County, Pa., where the Amish are less influenced by the fashions of popular music, to stores where demand is stronger, Ream said.

Analysis of sandal sales early in the year in the Sun Belt would indicate which styles will sell later in the North, offering guidance on which lines to mark up and mark down, Ream said.

Consolidation of data key

None of these uses would be possible, however, if Kinney Service had not found a way to consolidate its data collection.

From 1980 to 1983, it replaced a mixed bag of handwritten-receipt and scanning-device cash registers with IBM 3680 point-of-sale terminals.

The terminals communicate with Kinney's mainframes here through the Advanced Communications for Storage program, an IBM telecommunications polling package. Each day at 11 p.m., the program prompts Kinney's IBM 3083 mainframe, front-ended by an IBM 3725 communications processor, to initiate a series of telephone calls over 48 lines to the store terminals. The sales for the day have been "closed" on the terminals and the data is relayed into the mainframe, McMichael said.

Data that is collected at the point of sale includes a stock-keeping unit number that identifies the department from which the sale is made, a five-digit stock identification number, a gender and size code and the retail price, including any discount.

This information is tallied on sales that average $2.5 million a day for the eight divisions, and with it, Kinney drives its basic accounting and merchandising systems, including order picking, inventory replenishment and cash management.

Because the 3680 is programmable, additional data can be collected at the point of sale when the company has use for it, he said.

Users back development of automated data center tools

By John Gallant
CW Staff

With the expected introduction of its CA-Unicenter system today, Computer Associates International, Inc. is gambling on the strength of the market for automated data center tools. If the DP professionals contacted by *Computerworld* last week are representative of their peers, the Jericho, N.Y.-based systems software vendor may be backing a winner.

"In large shops with multiple CPUs, a system that automates manual operations would be of great interest," said Benjamin Fong, director of computer technology and operations for Western Airlines, Inc. in Los Angeles. The company operates four IBM mainframes, including a 3083 under VM, a 3033 and a 4381 Model 2 under MVS and a 4381 Model 2 under IBM's ACP/TPF.

"It is true that the data center is one of the least automated departments today. But the environment changes so fast that it has been hard to stay on top of automation," Fong continued. "End users are our top priority. Their needs typically necessitate changes in CPUs, software and peripherals. In the face of that rapid change, it is hard to automate."

Fong's comments were echoed by Norman MacVicar, director of systems and operations for Avco Computer Services, a division of Avco Corp., in Wilmington, Mass. MacVicar said Avco has taken steps to automate many of the former manual processes involved in operating its data center, which boasts two IBM 3033s and a 3083 under MVS and a 4341 under VM. But despite the strides the company has taken toward automation, MacVicar said there is still much to be achieved.

"Data centers are not as automated as they ought to be. Even we have manual processes that we would like to automate, such as automatic problem tracking," MacVicar explained. "There are some individual solution-type packages out there. But where the products are not available, you have to build them yourself. Data center people do not have the time to do that. We are too busy addressing other people's needs."

According to Donald Arthur, manager of operations research with Chattanooga, Tenn.-based Provident Life and Accident Insurance Co., the individual solutions available from a variety of vendors are not the answer to automated data center management. Provident runs IBM 3084, 3081 and 3033 mainframes, all under MVS/XA. The processors support a network of some 2,000 terminals, 1,200 of them remote.

"The waste and overlap involved with those multiple packages concerns me," Arthur said. "Even one vendor's products overlap in functionality. The true one-vendor solution is what I am looking for; it is the dream I pursue. But I do not see it out there yet. In our environment, the tools have to be integrated, or they just will not be reliable."

Arthur said his company is actively seeking a reliable automated job scheduling and submission system and capacity forecasting software. "We are certainly not the least automated department in the company," Arthur said. "But we are not as highly automated as we have to become this year if we are to survive. We are losing roughly 10% of our CPU cycles because of the lack of a job [scheduling] system we can rely on. We need a system that can start scheduled jobs when required to make sure we have completed our production work in order to get our on-line systems up on time."

Even users who feel they have adequately automated their own shops acknowledge the growing need for data center management tools. Robert Best, vice-president of data systems with Toyota Motor Sales USA, Inc. in Torrance, Calif., said his company's philosophy is to ensure that its data center workers are "as well taken care of as our other users."

But, he said, "The market is waiting out there. Operational problems are usually not related to hardware or software failures. In most cases, it is a manual process that has caused the problem. Those manual procedures invite problems."

Toyota currently operates an IBM 3081 and a 3033 under MVS. Relying primarily on IBM's Operations Planning and Control (OPC) scheduling software, Best said, the data center is manned by only three workers per shift. Another three employees maintain Toyota's nationwide computer network that ties together some 1,000 dealers.

In addition to OPC, Toyota runs about 70 other software packages aimed at reducing the manual effort involved in operating the data center. Asked if he was concerned about relying on products from different vendors, Best said, "Certain companies make packages that IBM does not offer or that are as good or better than IBM products. But we are very judicious in what we select. We think the single-vendor philosophy would be the right way to go."

CAI from page 1

sonnel. Operations tools are provided for job scheduling, documentation management, performance measurement, on-line and batch job accounting, capacity planning, tape and disk management and sorting.

Programming facilities include utilities for program optimization, error analysis and detection, test and debug, report generation and file management. While each of the packages was previously available from CAI and was integrated to varying degrees, a spokesman said, they now feature common screen and report formats and function keys and a standardized installation procedure.

■ The CA-Uniservice micro- and mainframe-based service, support and training system. This component includes a hard-disk-equipped IBM Personal Computer workstation that acts as a central node between the user's mainframe software and CAI's Customer Service Center, based here. Through CA-Uniservice's micro-mainframe link, users have 24-hour, on-line access to CAI's data base for problem reporting, requests for central support, product ordering and review of support data files.

Users can search a data base of program temporary fixes (PTF) by key word, download a required PTF and apply it through the CA-Activator portion of CA-Unicenter. CA-Uniservice also provides interactive, micro-based tutorials for each CA-Unicenter component and includes management support software, including the Supercalc3 spreadsheet, the Superproject project management system and audit and reporting tools to monitor system use.

■ The CA-Activator automated software installation and maintenance system. CA-Activator is an on-line, menu-driven tool that simplifies the installation of CA-Unicenter. It runs under IBM's TSO/ISPF and can be accessed through a separate CAI-supplied micro-to-mainframe link from the micro workstation. The tool acts as a front-end processor to IBM's Systems Modification Program (SMP) installation software.

CA-Activator, which was designed to ensure complete and standard installation of the CAI products, monitors all installation activity, defines SMP and library data sets, automatically allocates disk space, generates required JCL and submits the completed job to SMP for execution.

CAI, which earned wide recognition as a leader in systems software for IBM DOS/VSE environments, has also become one of the top players in the MVS systems software arena through product introductions and acquisitions. The company last year acquired Sorcim Corp. and Johnson Systems, Inc. and in April bought out Value Software, Inc. CAI's fiscal 1985 revenue was nearly $129 million, an increase of more than 50% over fiscal 1984 revenue of almost $85 million.

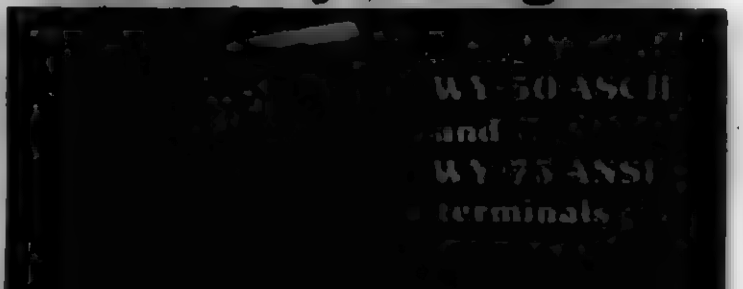
With the introduction of CA-Unicenter, CAI is betting that IBM's largest user sites are seeking to automate many of the manual processes involved in operating a data center (see related story above). Senior Vice-President David Tory said that the announcement and the company's thrust into the MVS systems software market are acknowledgments of the growing importance of MVS to IBM and its top customers.

"Our studies indicated that users are concerned about the spread of multiple vendor products and different procedures and levels of support," Tory said. "There is also a recognition that the data center is riddled with manual processes that are error prone. We have been automating all the other areas of the company, but the data center is a classic example of the cobbler's children having no shoes."

CAI said CA-Unicenter will be generally available in August. It will be priced at $144,000 for a three-year lease or at $188,000 for a perpetual license. CAI customers choosing to upgrade to CA-Unicenter will be offered credit for their products.

CAI is located at 125 Jericho Tnpk., Jericho, N.Y. 11753.

Smart Wyse Bargains



Buy, lease or rent from MTI today.

These are low-cost, smart editing alpha-numeric terminals with 14" tilt-and-swivel non-glare screens and a footprint of less than a square foot. They display 24 rows by 80 or 132 columns, have 16 programmable function keys, and feature soft set-up of terminal parameters from the keyboard. WY-50 compatibility: WY-100, ADM-31, TeleVideo 910 & 925, ADDS Viewpoint, Hazeltine 1500. The WY-75 is fully software compatible with the Digital VT100.

WHEN THE CHAIRMAN EXPLODES OVER A SECURITY LEAK,

WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

It doesn't matter who actually leaked it—if there's a failure in system security, it's *your* problem.

But now, at last, you have an ally. In VMCENTER.

VMCENTER puts you squarely in control of system resources—providing multiple levels of authorization, for maximum protection against security violations.

It also allows you to do a lot more. Change passwords in a flash, encrypt data through simple commands, and keep top management informed of potential problems through a variety of reports.

Best of all, VMCENTER makes *you* secure—knowing that problems are being taken care of *before* they happen, not after.

But there's more.

In addition to security problems, VMCENTER solves a lot of others, like disk and tape management, resource scheduling and accounting, even workload balancing. And it does it all in an integrated manner that's more effective than any possible collection of quick fixes.

VMCENTER. It's a survival tool—and then some. Once you use it, you'll wonder how you ever got along without it.

And the Chairman may even learn to feel the same way about you.

For more information on VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, Virginia 22180, telephone (703) 821-6886.

[illegible]

CRAY from page 1

also viewed as a positive step that will make researchers' jobs a little less complicated (see story above).

The first commercially available system to use a liquid immersion technique for cooling, the Cray-2 features an internal clock cycle of 4.1 nsec and a main memory capacity of 256 million 64-bit words (roughly 2G bytes).

It is also the first large-scale supercomputer to use a version of AT&T's Unix System V operating system, the Cray-2 Operating System. This marks a departure from Cray's proprietary COS operating system used on the earlier Cray-1 and Cray X-MP supercomputers. The spokesman said Cray will continue to support COS but that the company plans to offer Unix on the X-MP by 1986.

Physical characteristics

The Cray-2 consists of four basic parts: a 14-col. CPU configured in the familiar Cray 300-degree arc; two pumping stations, called Pods, used to pump a fluorocarbon coolant in and out of the CPU; and a reservoir used to store 200 gallons of fluorocarbon coolant.

The CPU occupies 16 square feet of floor space, stands 45 in. high and weighs 5,500 lb. It is made up of 320 multilayer plug-in modules, each containing roughly 750 integrated circuit packages. Each module contains approximately 240,000 chips, including about 70,000 MOS memory chips. The gate array logic chips, consisting of 16 gates, use emitter-coupled logic circuitry, the vendor said.

The CPU consists of one foreground and four background processors. The foreground processor coordinates the data flow between the common 256 million-word main memory and all external devices via four I/O channels. The common main memory is divided into four quadrants with 128 interleaved banks. All memory access is automatically performed by the hardware, and any user can access all or part of this memory, the vendor said.

The four background processors are used to perform both scalar and vector calculations. Cray claimed each of the background processors is more powerful than the company's original Cray-1 CPU and includes its own 16,384 words (or 131K bytes) of local memory, which is used for temporary storage of vector and scalar data. The company said the background processors can operate independently on separate jobs or together on a single problem.

The Cray-2 CPU is divided into 14 vertical columns, each of which consists of 24 processor modules (there are 16 blank slots in the system) and a power supply. The entire CPU is filled with the liquid coolant, a chemical called Fluorinert, manufactured by 3M Corp.

The chemical is said to be a colorless, odorless, inert fluorocarbon that is both nontoxic and nonflammable. While the coolant is costly, about $230/gal., the Cray spokesman said the company believes the coolant will not deteriorate with age, nor will it have to be replaced.

The spokesman added, however, that Fluorinert does evaporate, and users will have to add coolant to the system periodically.

The fluorocarbon liquid is circulated through the CPU cabinet and comes into direct contact with the integrated circuit packages. The spokesman said the coolant is pumped into the CPU at 70 degrees Fahrenheit, and its temperature is elevated to 77 degrees Fahrenheit when it is pumped out. If a processor module fails, users have to pump the coolant out of the CPU and into the coolant reservoir before maintenance can be performed.

The Cray-2 Operating System is based on AT&T's Unix System V, but the kernel has been enhanced to boost I/O processing performance and to handle large data files more efficiently.

The Cray-2 was designed to use an enhanced version of the company's CFT Fortran compiler used on the earlier Cray-1 and Cray X-MP systems. Called CFT Version 2, the compiler is said to allow Cray-2 users to take advantage of the company's existing scientific subroutines.

Supports C language

The Cray-2 also supports the C programming language, which the vendor said was used in developing the Cray-2 Operating System and forms the basis of most of the utility programs used with the system.

Cray said it had installed a prototype of the Cray-2 several months ago at the Lawrence Livermore National Laboratory's National Magnetic Fusion Energy Computer Center in Livermore, Calif. A second system will be delivered this summer to the Numerical Aerodynamics Simulation Program at the National Aeronautics and Space Administration's Ames Research Center at Moffett Field, Calif., the company said.

Cray is located at 606 Second Ave. S., Minneapolis, Minn. 55402.

Two charged with computer fraud to gain SSA benefits

False entries alleged for 'large sum' theft

By Mitch Betts
CW Washington Bureau

JACKSON, Miss. — Two former Social Security Administration (SSA) workers are scheduled to go on trial July 16 in U.S. District Court here on charges that they fraudulently obtained disability insurance payments by entering false employment information into the SSA's computer in Woodlawn, Md.

A federal grand jury issued an indictment last month against a married couple, Walter S. Gandy and Margaret F. Gandy, of Edwards, Miss.

The indictment alleged that the two defrauded the SSA to obtain benefits for themselves and two other people.

The Gandys pleaded not guilty to the charges at an arraignment last month. The defendants' lawyer, Tom Royals, could not be reached for comment.

False entries to obtain benefits

The indictment states that in 1976, Margaret Gandy, at the time a claims representative in the SSA's Laurel, Miss., office, used a computer terminal to make false entries to obtain disability benefits, according to Assistant U.S. Attorney Henry Wingate.

Wingate said it is unclear exactly how much money the Gandys obtained, but he added that it was a "large sum."

The seven-count indictment against the Gandys included charges of wire fraud, mail fraud and making false statements to the government. Each charge carries a maximum penalty of $10,000 and five years in prison.

Access to terminal at work

Wingate speculated that Margaret Gandy had access to a computer terminal in the course of her work as an SSA claims representative and could make entries and changes in the files.

However, Phil Gambino, an SSA spokesman, said claims representatives do not have terminals yet.

According to Gambino, claims representatives help claimants to process paper forms. These forms are then turned over to data transcribers who enter the data into the computer.

This separation of duties prevents claims representatives from making direct computer entries, an informed source at the SSA said.

The source explained that the fraud alleged in the Gandys' case is actually perpetrated when the false information is supplied on the paper form.

Antipiracy unity urged

By Maura McEnaney
CW Staff

MONTREAL — Mention software protection to a group of worldwide developers and distributors, and suddenly you are speaking an international language.

Illegal copying of software is a problem that exists in every technologically advanced country, and each is mounting its own efforts to enforce software protection laws. "There must be a degree of international conformity in this area," said Daniel Mersich, a Canadian attorney specializing in computer law.

Speaking at the recent Montreal International Software Market, Inc. (MIM) '85, Mersich said software piracy in Canada is considered a criminal action, since it can be classified as theft.

Mersich cited several examples of Canada's efforts to control software piracy. Unauthorized copying of confidential names from a computer data base constitutes a theft in Canadian courts, Mersich said. The Superior Court in Montreal also recently ruled against a company that made unauthorized copies of a registered trademark displayed in the software and removed the publisher's name from pages of the user's manual, he said.

"Copyright law is the most effective weapon we have against software piracy," according to Brian Niblett, a Welsh attorney and author of a book on protecting computer programs. "Criminal law and patent law have a limited part to play in protecting software," while trademark laws can be only somewhat effective, Niblett said.

Although site licensing — under which companies pay a set price for an unlimited number of copies of a program — is becoming a popular concept among both developers and licensees, it is difficult to impose liabilities for contractual violations on the part of the user, Niblett said.

While copyright may be the best avenue of protection for software developers, it often needs to be combined with several contractual protections, noted Yoshikazu Takaishi, general counsel for IBM Japan, Ltd. "There is no set menu for protective measures as legal panaceas," he said.

DOS/VSE JCL

If you want to learn to code effective job-control language for a DOS/VSE system, you've got your work cut out for you. The information you need is spread through more than a dozen IBM manuals. And because the manuals have to cover everything, the important points are often hidden by the details.

But now, a new book called *DOS/VSE JCL* saves you the trouble of struggling through the manuals. It teaches you everything you need to know to run everyday jobs...without burying you in detail. And with this background, you'll be able to use the IBM manuals efficiently when you have questions about unusual applications.

What this book covers

Part 1: Introduction The first part of this book gives you the background you need to start coding JCL. First, you'll learn about IBM mainframe hardware and configurations. Next, you'll learn about basic features of the VSE operating system, like multiprogramming, virtual storage, data management, and libraries.

One of the most confusing parts of VSE to new users is that some common system functions—like interactive editing and spooling—are managed not by VSE itself, but by other program products—like VSE/ICCF and VSE/POWER. So you'll learn right away what those products are and what they do. Then, you'll learn how to use ICCF to enter text at a terminal.

Part 2: Job-control language In Part 2, you'll learn a practical subset of VSE JCL and see how to apply it in realistic job streams. You'll also learn how to code JCL to control storage, libraries, and device assignments. And you'll find out how to code and use cataloged procedures.

Part 3: VSE/POWER Part 3 shows you how the VSE spooling program, POWER, works. Here, you'll learn to code POWER job entry control statements (JECL) to manage job scheduling and output processing. And you'll learn how to use ICCF to submit a job to POWER, monitor its progress, and get its output.

Part 4: Advanced data management In this part, you'll find out how to use the label information area to store permanent file labels, how to do advanced tape processing, and how to code job streams to process all types of DASD files: SAM, DAM, ISAM, and VSAM.

For VSAM, you'll learn its specialized concepts, plus how to use the Access Method Services (AMS) program to define catalogs, data spaces, and files. You'll also learn how to use 2 VSAM compatibility features: the ISAM Interface Program and the VSAM Space Management for SAM Feature.

Part 5: Program development and library maintenance In this part, you'll learn how to code job streams to run the VSE language translators and the linkage editor. You'll also learn how to translate and test programs interactively through ICCF. Then, you'll learn how to code job streams to maintain VSE libraries.

Part 6: Utility programs Part 6 shows you how to code job streams for the most useful functions of 3 common utility programs: Sort/Merge, DITTO, and AMS. So you'll learn how to use these utilities to create, copy, print, sort, and merge files.

Why you should try this book ...whether you're a VSE novice or expert

If you're new to VSE, *DOS/VSE JCL* will get you started right. Instead of blindly copying other people's work, you'll learn what features of VSE to use and how to use them well.

If you're an experienced VSE user, this book will help you understand your system better. With our *OS JCL* book, an operations supervisor wrote that at last he knew *why* he was doing what he did. Several people told us how much that book helped with OS conversions. And a JCL expert said *OS JCL* let his programmers solve most of their own JCL problems...so he could focus on the really challenging ones.

I'm sure you'll find the same is true of *DOS/VSE JCL*. It will give you that extra knowledge that lets you do your job more easily...and with better results.

So why wait to master DOS/VSE?

If you want to learn more about DOS/VSE JCL...or you want to have a better understanding of how VSE works...get a copy of *DOS/VSE JCL* right away. I'm sure you'll quickly gain more practical knowledge of VSE than most of your colleagues have...even those who have been using VSE for years.

If you're an OS user...

Like *DOS/VSE JCL*, our *OS JCL* book concentrates on the JCL you need for common, everyday applications. That means you'll learn to: execute utility, sort/merge, language translator, and link-edit programs; create, maintain, and execute JCL procedures; code JCL for handling sequential, direct, ISAM, and VSAM files; and more!

Our unlimited guarantee

You must be satisfied. Our books must work for you, or you can send them back for a full refund...no matter how many you buy, no matter how long you've had them.

Geisco reorganization to target specialized net services

By Mitch Betts
CW Washington Bureau

ROCKVILLE, Md. — General Electric Information Services Co. (Geisco), undergoing a major reorganization in response to a stagnant market for its traditional remote computing services, plans to make aggressive moves into such specialized markets as electronic data interchange for business-to-business orders and payments, Geisco officials said last week.

Geisco will specialize in a portfolio of electronic data interchange applications for vertical markets, such as the transportation and office supply industries, and automated clearinghouse services for banking and medical insurance transactions, company officials said at a press briefing.

In addition, Geisco officials said the company will continue to offer and enhance its packet data network service, office communications services, such as electronic mail, and the new Dealer Talk network for communications between manufacturers and their dealers.

"There is a heightened sense of urgency to get where we need to go," said W. James McNerney Jr., who was appointed senior vice-president of marketing and U.S. sales operations, citing the business pressures on Geisco's broad-based services.

"We've got to face that reality," he said.

Results of reorganization

Last month, Geisco announced that the reorganization resulted in the layoff of about 400 workers in marketing, sales and technical positions [CW, June 3]. On May 31, Geisco sold Network Consultants, Inc., a Chicago-based subsidiary specializing in wire transfer software for banks, to Dallas-based Mtech, Inc., a vendor of software packages designed for the banking industry.

As part of the reorganization, Geisco last week announced a series of management personnel changes. McNerney was given responsibility for marketing and sales, as well as for all of the new domestic business ventures.

Responding to questions, McNerney said the reorganization de-emphasizes certain business lines, such as single-client software packages and consulting services, that do not take advantage of Geisco's worldwide telecommunications network. "You cannot play everywhere in the computer services industry anymore," he said.

McNerney said the new ventures will produce annual growth rates of 25% to 45%, consistent with the corporate culture at Geisco's parent, General Electric Co.

"Luckily, selectivity doesn't dampen your growth rates," he said.

WANG

from page 1

end of the quarter, the company said. Earlier this year, Wang said it would shut down production for two weeks in July.

Stephen K. Smith, a securities analyst with Paine Webber, Inc., said the company is facing a very tough situation from which it could take years to recover. "I would go so far as to say Wang has three problems: IBM, IBM and IBM," Smith said.

IBM's aggressive moves into departmental data processing with its System/36 have severely impacted Wang's sales, and the general U.S. computer sales slump and adverse foreign exchange rates have magnified the problem, according to Smith.

Wang spokesman Peter D. Connell said the layoffs, the first for the company since the 1974 recession, will "be across all areas of the company" in U.S. operations and will represent 5% of its worldwide work force. He said the slump is "mainly a U.S. phenomenon" but has impacted all product areas.

He added that sales of Wang's VS minicomputers are doing relatively well, and personal computer products are selling well in Europe.

Connell rebutted persistent rumors that John Cunningham, Wang's president and chief executive officer, will be leaving the company. "I wish I could put those rumors to rest," he said.

An Wang, chairman and founder of the company, has taken a more visible role in day-to-day operations this year, Connell said, but he added that Wang "has always been the driving force for the company; he has always been looking over the helm."

The retrenchment may serve to strengthen Wang's role in selling to MIS departments, Connell insisted. "We have focused our marketing efforts; we have hired aggressively people with special skills to reach the MIS director," he said.

But he conceded the company is directly battling IBM. "We have targeted [Wang's] capabilities in departmental data processing," he said. "That continues to be a major development area and market area where IBM has focused its System/36."

Smith said Wang has the "bright people and bright ideas" to turn things around, "but it is not going to happen overnight." Wang must broaden its product line, and in that vein, it may begin marketing engineering workstations that were developed internally, Smith said.

IBM's 4700 financial family gets modular processor

By Tom Henkel
CW Staff

DALLAS — IBM chose last week's American Banking Association National Operations and Automation Conference here to unveil a modular CPU for its 4700 line of financial systems.

The 4702, based on a proprietary 16-bit CPU, was designed for banks and financial institutions with remote locations. It can perform a variety of financial processing tasks such as teller transactions, loan processing and automated teller machine (ATM) functions, IBM said.

The 4702 is available with 512K to 4M bytes of main memory and can support up to two diskette drives and two optional fixed-media disk drives. The 4702 supports 4700 communications terminals and other devices at branch or remote locations while providing a communications link at up to 19.2K bit/sec. to a host processor. This, IBM said, enables terminal users to process transactions on-line and to update continually the data base in the host processor.

The 4702 can also be used as an off-line stand-alone processor for uses such as running an ATM terminal. For example, as customers use the ATM during the day, the transactions are processed and stored locally in the 4702. The transactions can then be sent overnight to a host processor, such as a System/36 or an IBM 3090 mainframe, located in the bank's main office.

A basic configuration of the 4702, including 512K bytes of main memory and a 5¼-in. diskette drive with 1.2M bytes of storage, costs $9,900. Main memory can be expanded in 512K- or 1M-byte increments up to 4M bytes at costs of $2,500 and $5,000, respectively. A second 1.2M-byte diskette drive costs $650. An optional 72M-byte fixed-media disk drive costs $4,000. The 4702 will be available in October, but the fixed-media disk drive will not be available until December, IBM said.

IBM is offering an on-site exchange service for the 4702 and 4700 display terminals. The service costs $215 per year for a basic 4702 configuration.

At the same time, IBM announced the 4708 disk drive, available in two capacities, for users of the 4701 Model 3 finance controller who want to store large amounts of data locally. Available in 72M- and 144M-byte capacities, up to two drives can be attached to the 4701 Model 3. Available in December, the 72M-byte version costs $6,400, and the 144M-byte version costs $10,400, IBM said.

Othes products in the 4700 line include the following: the 4704 finance communications display station, a CRT terminal used for interactive banking applications, the 4710 system receipt/validation printer, 4715 continuous forms printer, the 4720 forms passbook printer and the 4730 ATM.

[illegible]

CW AT NOAC

Ramblings from the floor at the American Bankers Association's annual National Operations and Automation Conference (Noac) last week:

■ "Banking is Big Blue" would qualify as an appropriate theme for this year's conference.

According to one software house, its future success is contingent on designing for the IBM environment. Of the 300 top banks in the country, 100% have IBM installations, and installations are in the high 90% range for the next tier of banks.

"Bankers won't think of making any decision other than to buy IBM. They won't take the risk. They don't have to. They are bankers," he added.

■ During the conference, more than 400 IBM representatives flooded the exhibition floor, intently poring over the latest software enhancements in the banking marketplace and eagerly awaiting product previews of enhancements to the IBM 4700 financial communications system, rumored to be based on the IBM System/36.

IBM took over a Dallas hotel for its entourage and even printed its own program.

■ Not to be outdone, Ericsson, Inc., the Swedish electronics and telecommunications firm and a new entry into the micro market with a branch automation system, was making a splash by giving away designer telephones to anyone who would sit through their 15-minute presentation.

"An excellent way to get the attention of the marketplace," commented one attendee clutching his telephone.

■ Then there was Jack Chang, president of Dallas-based Quadstar Corp., a legend in his own time in the electronic payments industry, it would seem. He is a co-patent holder on the first automated teller machine (ATM) and the magnetic strip-coded credit/debit card.

While standing at his company's booth, Chang steadily acknowledged the continual stream of well-wishers who also appeared extremely interested in the late 1984 sale of his eight-year-old company to Citibank, the banking subsidiary of Citicorp.

Citibank strikes fear in the heart of regional bankers, who dread the day interstate banking could become a reality and who might face Citibank's deep pockets.

According to Chang, Quadstar is the only Citibank subsidiary that can sell hardware and software packages in a completely independent marketing mode. Quadstar developed and installed the nation's largest operating electronic funds transfer system for the Florida-based Publix Super Markets, Inc. chain, a system of 319 ATMs in 282 sites, to which is being added more than 3,000 point-of-sale terminals.

Another Smart Solution From AVATAR

It's a sad sight. Seeing your IBM 3270 printer falling further behind every day. Outpaced by ASCII printers that deliver far greater performance at a much lower cost. ASCII printers that, until now, didn't link to your 3270 system.

Enter AVATAR's PA1500 protocol converter. It lets you attach virtually any ASCII printer directly to your 3270 network with a simple coax connection – including printers that are three times as fast as your IBM printer and cost half as much.

Now you can select the printer that matches your system needs. For greater speed, letter quality printing, better performance. Fast dot matrix or line printers. Bar code or graphics printers. Even the newest ink jet or laser printers can be a part of your 3270 network.

Together, the PA1500 and the printer of your choice give you all the capabilities of your IBM printer...and more.

So get yourself an AVATAR PA1500. And bring your 3270 printer up to speed.

Micros move to banks' front lines as client service tools

CW AT NOAC

By Bryan Wilkins
CW Washington Bureau

DALLAS — The microcomputer is moving into the front office next to the loan officer at the bank.

It is moving from the bank's back-office DP center as rapidly as competition from other financial service providers is forcing changes in the traditional way of handling money.

That was the consensus at last week's annual National Operations and Automation Conference (Noac), sponsored by the American Bankers Association for bank DP managers. In his keynote address, Joseph J. Pinola, chairman of the board of First Interstate Bancorp in Los Angeles, said, "The competitive strains on the banking industry are the most intensive ever."

Aided by micros, banks are developing new services such as daily reporting of corporate cash balances as users demand more sophisticated services.

According to John McAllister, executive vice-president of Broadway & Seymour, a Charlotte, N.C., developer of branch automation software for IBM's 4700 series financial products, bank technology is demanding a new type of performance: One such application, he said, is placing a smart on-line terminal on the desk of the bank officer to access a client's account record, look at the bank's current cash exposure or determine the daytime overdraft.

"We see a 39% annual growth rate for bank technology through 1990," McAllister said.

In the past, micros in banking were usually acquired on an ad hoc basis, said Joseph C. Cauley, manager of the end-user consulting group at Citizens & Southern National Bank in Atlanta. This was followed by management efforts to control their proliferation.

Now that microcomputers are being accepted in banking, Cauley said, they are being used in the development of new client services and products and to aid a bank's productivity, even though critical strategic bank decisions on the architecture of micro-mainframe links are not yet in place.

Micros, for example, are being linked in vendor-supplied local-area networks and connected to mainframe data bases, paralleling the evolution of data base management systems and the office automation sector, Cauley said.

However, according to Cauley, microcomputer users in banks tend to be demanding. Initially happy with off-the-shelf packages such as Lotus Development Corp.'s 1-2-3, they are now demanding access to raw mainframe data.

Cauley reported that simple downloading from the mainframe to the micro is not easy in the bank environment despite the existence of software packages designed for the task.

In one instance, "Our fixed asset people wanted to download selected information from fixed asset and general ledger. They thought by loading information into [the Lotus software] they could automate the balancing and would save lots of time. We had to write specific applications code to extract the information from the mainframe file," Cauley recalled in a conference session on managing micros.

> ”
>
> *Micro users in banks are now demanding access to raw mainframe data.*

"Micros are being used in distributed processing solutions because they are very modular. They can be set up to emulate a dumb terminal and they can also function as an on-line transaction processor," noted Bryan Girard, president of San Francisco-based Bankpro, which markets an IBM Personal Computer-based electronic funds transfer system called Wirenet.

Girard sees the micro being used to off-load job functions from larger systems, such as the IBM System/36, which can then become dedicated to another task, such as functioning as a server for micro cluster configurations.

The IBM Personal Computer and Personal Computer AT will allow smaller banks that make 600 to 1,200 EFTs a day to cost-justify connection to the Federal Reserve System's Fedwire and other payment systems.

In the estimation of Jerry M. Cox, senior management consultant for Charles Brooks Associates of Charlotte, N.C., the proliferation of the micro has been good and bad for banking.

Although the development of user-friendly micro software has helped give banks a competitive edge and provide up-to-the-minute cash management services to valuable clients, the packages are still too reliant on technology, he said.

SUDDENLY, YOU'VE EXPANDED YOUR SERVICE NETWORK BY 2,700 PEOPLE.

How? By utilizing Diebold® Quality Care™ as a third-party supplier for your local, regional or nationwide service needs.

Diebold maintains approximately 400 service locations in every state and Puerto Rico, staffed by over 2,700 highly trained personnel supported with a multilevel inventory stocking program and highly skilled technical support organization.

Now you can offer your customers the same high-quality, responsive service that's made Diebold a leader in the service of electronic and electromechanical systems for the nation's financial and retail markets.

Diebold Quality Care is your entry into service excellence surrounded by a tradition of solid commitment to responsive, professional, dedicated service.

And it's an opportunity to help you sell more by expanding your products' service offerings—instantly.

If the idea of one-source service appeals to your sense of efficiency, you owe it to yourself to learn more about Quality Care—at no obligation. Write our Director of Marketing, Customer Services Group, DIEBOLD, INCORPORATED, P.O. Box 8230, Canton, OH 44711. **Or, for faster response, call 216-489-4110.**

Strong micro control yields results for bank DP shops

CW AT NOAC

By Bryan Wilkins
CW Washington Bureau

DALLAS — Strong, centralized management control over microcomputers is winning converts in the banking industry as performance and productivity rise, according to bank DP managers who have fought the micro control battle.

Speaking at the annual National Operations and Automation Conference (Noac) here last week, Thomas E. Wilson, manager of information services at United Banks Service Co. in Englewood, Colo., said the critical issue for its parent company, United Banks of Colorado, Inc., when it installed micros was to ensure that the micros emulated existing mainframe computer functions.

"We had to ensure that we had a micro product that complemented our existing mainframe because we didn't want a proliferation of unrelated micro applications popping up all over the place," Wilson said.

The service company set up what it called a primary information processing system to centralize all processing for the $4 billion bank holding company. That system had to include processing from five individual banks, he explained.

Wilson said the next step was to follow a strategy for what jobs the micros would perform in order to define the structure in which they existed. "Budget and profit planning for the various services and products the bank wanted to offer was an obvious area," he noted.

With the bank's mainframe software running in an IBM Systems Network Architecture/Synchronous Data Link Control environment on IBM 3033 and 3080 mainframes, the micro-mainframe link initially depended on the IBM 3278 terminal system. An existing SAS Institute, Inc. data base management system package, as well as a file transfer program from SAS, was intended to be transferred to an IBM Personal Computer XT and AT environment, which would then run commercial off-the-shelf applications, such as Lotus Development Corp.'s 1-2-3 for DBMS and Multimate International Corp.'s Multimate for word processing, and some in-house-generated applications.

According to Wilson, when the micros began running in their mainframe mode, the mainframe appeared to function as a powerful dedicated hard-disk support system that contained 256M bytes of memory, making it an "extremely important resource."

The micros could access the bank customers' account data by bank service category and perform profit and loss analyses of bank data by service category on a monthly basis in a fraction of the time that it had previously taken.

Manipulating data for later uploading to the mainframe was a subject about which many bank MIS directors used to groan because of security and data integrity concerns. This was no longer an issue, however, because the micros were doing jobs the mainframe formerly did, Wilson explained.

Summarizing the bank's experience, he asserted that starting out with a good mainframe product is important to keeping data integrity from becoming an issue.

United Banks personnel are now calculating asset/liability ratios in 10 minutes with micro applications, Wilson said, while bank chief executive officers can project their bank-year figures in 20 minutes.

Labor groups sponsor VDT study

NEW YORK — Long outspoken in their views about pregnancy hazards associated with VDT use, two labor groups have commissioned a New York-based scientist to conduct a four-year study on the subject.

The Service Employees International Union and 9 to 5, the National Association of Working Women, announced last week that Dr. Irving Selikoff, professor at the Mount Sinai School of Medicine at the City University of New York, will study work patterns and reproductive histories of more than 10,000 working men and women. Both organizations will recruit study volunteers, a spokesman said.

The study will be funded in part by the March of Dimes. Selikoff's laboratory is supported by the American Cancer Society.

How To Delight Your Lotus With Mainframe Data
3081
3081

Another Smart Solution From AVATAR

The idea is simple. Make your PC spreadsheet even more powerful by giving it mainframe data. But getting that data out of your mainframe, into your PC and onto your spreadsheet isn't that simple.

Until now, you've had three choices. Transfer entire files from the host and risk choking your PC with data. Not very efficient. Or find the information in printed reports, then reenter and reformat it. Very tedious. And the alternative of asking your DP department to write special host software…well, they're overburdened already. Three choices, no real solution.

Now there's TURBO, the newest micro-to-mainframe link from AVATAR.

TURBO's Data Capture lets you select just the information you need from the mainframe. And use it immediately in any of your PC applications – Lotus, dBASE, you name it. Without re-keying, reformatting, re-anything.

And you can use TURBO's host-assisted File Transfer the way file transfer was meant to be used – for sharing data with other PC users on the 3270 network.

If that isn't enough, TURBO's exclusive Macro Language adds a whole new dimension to your micro-to-mainframe link. Use Macros to automate file transfer and data capture. Better yet, massage host data even before feeding it to your spreadsheet.

So give your PC a TURBO from AVATAR. And delight your Lotus with mainframe data.

Banking crises bringing push for tighter EFT controls

CW AT NOAC

By Bryan Wilkins
CW Washington Bureau

DALLAS — The recent banking crises in Ohio and Maryland, where problems in individual bank loan portfolios fostered 1930s-style bank runs, are prompting new measures to tighten bank management practices, according to the director of data processing for the New York Automated Clearing House Association (Nacha).

Nacha, the country's largest private electronic funds transfer (EFT) network, processes 96,000 payments, worth approximately $300 billion, daily, explained William Walsh, its DP director. This volume compares equally to the Federal Reserve Board's total daily EFT transfers for the entire U.S.

"The financial problems we have experienced recently in various states have prompted a greater awareness by banks of the processes we use to manage cash," said Walsh, who was attending the American Bankers Association National Operations and Automation Conference (Noac) last week.

> *'The financial problems . . . in various states have prompted a greater awareness by banks of the processes we use to manage cash.'*
>
> — **William Walsh**
> **New York Automated Clearing House Association**

Walsh, however, distinguished between the degree of expertise that exists in a bank's oversight of its own customers' net cash positions and the less certain ability to monitor the cash exposures that rapidly change between banks themselves.

"We don't have many software applications that address a bank's exposure, and we see that the Fed is having to address this problem," he added.

Nacha recently inaugurated its own internally developed software program to monitor the bilateral cash relationships between banks in response to this perceived problem, Walsh said.

Essentially, the program establishes limits on the amount of a bank's exposure to another bank, with the information on the bank's net cash position at any given time stored within the Nacha system.

As many as 138 "world class" banks are currently connected to the Nacha system and are also connected into the Federal Reserve System's Fedwire. The banks must comply with the Fed's regulations on daylight overdraft limits between banks that measure the amount of net credits and debits that exist at any one time for a bank.

BMC Software abandons suit against IBM

ARMONK, N.Y. — BMC Software, Inc. of Stafford, Texas, last week dropped its 11-month-old antitrust suit against IBM.

The suit, filed last August in U.S. District Court in San Jose, Calif., claimed that IBM had been illegally requiring its customers to purchase an IBM disk-logging program when they bought IBM's IMS data base management system, according to IBM spokeswoman Pamela Hawkins.

BMC Software received no money or other concessions from IBM in return for dropping the suit, Hawkins said.

BMC Software could not be reached for comment at press time.

Hawkins, however, claimed that BMC Software's suit had been crippled in December when Judge William A. Ingram ruled that there was no basis for BMC Software's claim of illegal tie-in sales.

A secondary BMC Software claim that IBM had a lease-only policy for IMS 1.3, the software's latest release, remained to be ruled upon by the court prior to BMC Software's cessation of the suit.

Responding to that claim, Hawkins said "IBM doesn't lease [IMS 1.3], it licenses it." She maintained that BMC Software's dismissal of the suit was not the result of a settlement with IBM and said that the dismissal means that "BMC is prohibited from reinstituting legal action" in the case.

During the 1970s, IBM was sued by competitors alleging antitrust law violations on at least nine occasions. Of those cases that went to trial, IBM won all of them.

Now one word says it all.

Practically everything you need in digital communications in one word. *Pathways*℠—advanced network services from the NYNEX telephone companies, New York Telephone and New England Telephone. Pathways services will link your business in ways you never thought possible. With peace of mind you never thought possible.

NYNEX Pathways services will include a wide range of digital operations that will eventually provide complete ISDN capability. But while Pathways services will be growing for years to come, you don't have to wait years to start. Already, your business can take advantage of services such as:

Digipath℠ digital service, to provide multi-point data transmission that can send data at speeds up to 56 kbps with exceptional accuracy.

Superpath℠ 15 mbps service, to transmit voice, data or images quickly and economically.

And before the end of 1985, we plan to introduce five new services:

Flexpath℠ digital PBX service provides direct inward and outward dialing for digital PBXs over a 15 mbps facility.

Intellipath℠ digital Centrex service that will offer a wide range of features directly throughout our network, rather than through premises equipment.

Infopath℠ packet switching service allows economical and reliable transmission for interactive data applications.

Switchway℠ switched 56 kbps service offers a cost-effective alternative

Tandem E-mail tools let dissimilar systems swap data

By Jeffry Beeler
CW West Coast Bureau

CUPERTINO, Calif. — Tandem Computers, Inc. today entered a new phase in its long-range product strategy by introducing five electronic mail utilities that reportedly use existing Tandem networks to exchange information among incompatible business machines.

The Tandem communications software utilities are as follows:

- PS Mail, which reportedly allows users of selected models of dissimilar terminals or microcomputers to exchange documents electronically over a Tandem communications network.
- PS Text Edit, which permits those documents to be written and then edited prior to transmission or following receipt.
- PS Text Format, which aids users in designing and formatting their electronic transmissions.
- Faxlink, which enables images to be sent over a Tandem network, stored in a mainframe, retrieved and then printed out at any CCITT Group III facsimile machine.
- PC Link, which reportedly allows IBM or compatible micros to emulate 3270 or Tandem 6530 terminals and then exchange files with mainframes. A typical application might involve a large retail store chain that needs to download daily price changes from its central office to micros in the field, according to Jeri Edwards, a Tandem product manager.

The operation of each of the five mainframe-resident or diskette-based software modules depends on Tandem's Transfer, which reportedly moves information, regardless of its source or format, among individuals or applications.

Since Transfer's introduction in 1982, many of its information delivery capabilities have remained largely unused, according to Kathryn Weiner, a Tandem product management director. But the addition of the five information management tools finally permits those capabilities to be tapped, she said.

Tandem's move on the communications front broadens the selection of business machines that can exchange information over the company's network. In the past, the vendor's own 6530 and Dynamite workstations were the only desktop devices that could send and receive information through Transfer.

With the electronic mail programs, Tandem has expanded the range of Transfer-supported workstations to include TTY-class terminals, 3270s and IBM or compatible personal computers. The products also allow information to be moved over Tandem networks in a variety of forms. Used together, the packages reportedly enable the company's users, for the first time, to send, store and retrieve images either alone or combined with electronic text.

The additions to Tandem's product line mark the debut of the company's Information Management Technology (IMT) strategy, a long-term plan for interconnecting incompatible machines and networks through the firm's existing communications facilities. Ultimately, IMT aims to ensure that Tandem's own networks form the communications backbone for Fortune 1,000 companies, its major target customers, Weiner said.

Scheduled for shipment during the third quarter, the five Tandem electronic mail programs are available for initial license fees ranging from $495 to $12,500, with additional monthly charges ranging from $50 to $200.

Tandem is headquartered at 19333 Vallco Pkwy., Cupertino, Calif. 95014.

ICCP outlines recertification

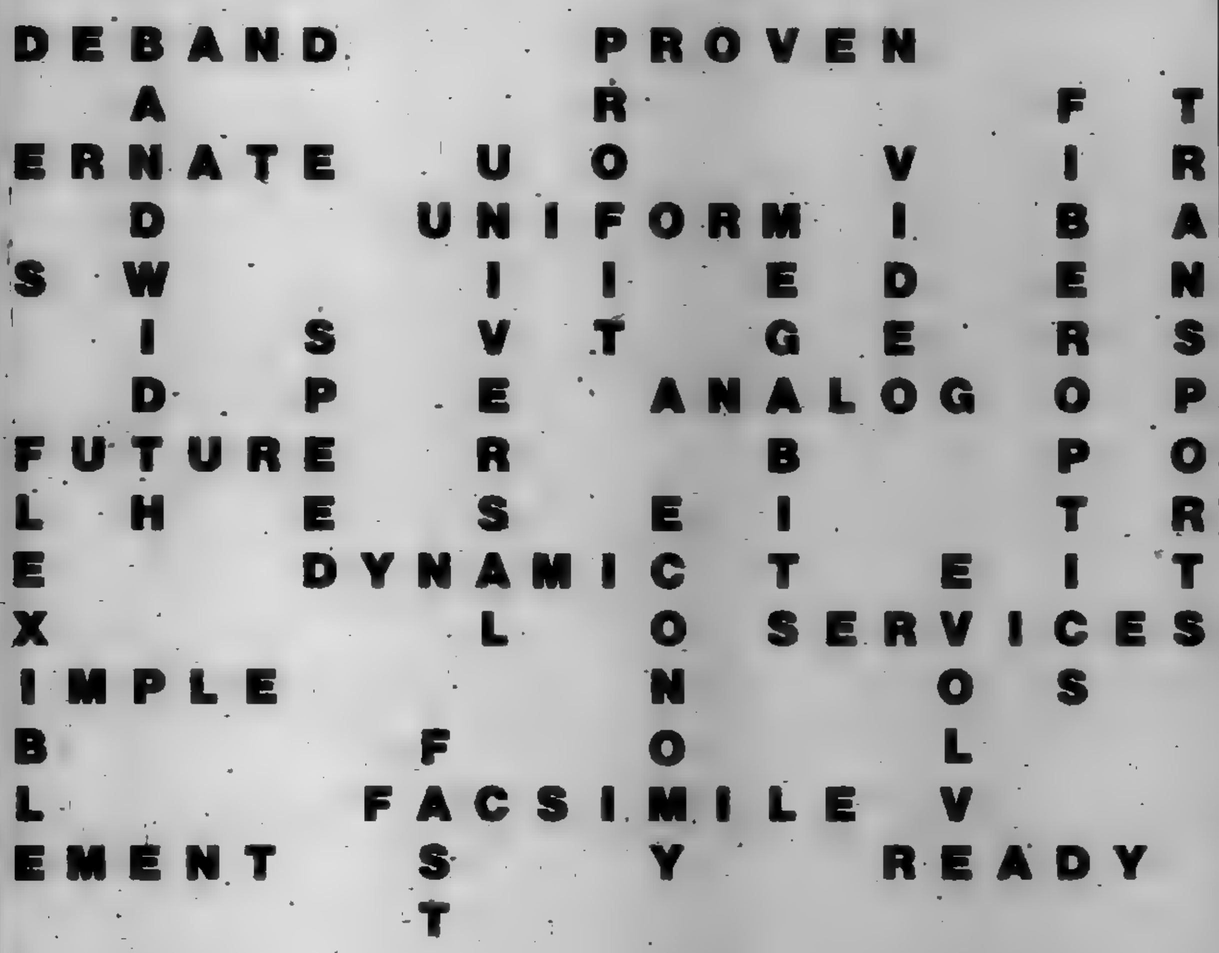
DES PLAINES, Ill. — The Institute for Certification of Computer Professionals (ICCP) has announced guidelines for recertification in its Certified Systems Professional (CSP), Certificate in Data Processing (CDP) and Certificate in Computer Programming (CCP) offerings.

A three-year recertification cycle for the CSP program will begin Jan. 1, 1986, a spokesman said. The program requires 120 contact hours of continuing education during each three-year period following the original attainment of the certificate. Educational activities preapproved by ICCP will be credited toward the recertification.

Current CSPs and those qualifying under the Professional Experience Provision, which ended May 31, may earn credits for approved educational activities as of Jan. 1, 1985, provided that validated documentation is submitted, the spokesman said.

The recertification cycle (120 hours of credit in a three-year period) for applicants taking the CDP and CCP exams will begin with the May 1986 applicants, the ICCP said. CDP and CCP holders who received their certificates before 1986 will not have mandatory recertification requirements, the spokesman said.

More information is available from ICCP, 2200 E. Devon Ave., Des Plaines, Ill. 60018.



to high-volume private lines.

Quickway™ digital service provides a digital data service for areas where Digipath service is unavailable.

[illegible]

In the future, we'll be adding important new services to keep Pathways services ahead of their time. And since NYNEX is one of the leaders in developing international ISDN standards, you know the Pathways services will be compatible with new digital systems as they're developed. So your communications won't grow obsolete. Only better.

[illegible]

You can rely on us to have network services that are compatible with your equipment, and your needs. Because we don't represent a single manufacturer's interests—we represent your interests. And with our years of experience in the world's toughest business market, no one knows your communications needs better. And no one is more committed to your future.

Before you make your next move, call 1 800 441-1919 for the names and numbers of contact personnel for New England Telephone and New York Telephone, or our authorized sales agents.

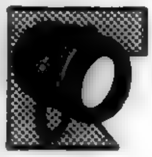
Vendor maintenance strong, despite third-party surge

By Jeffry Beeler
CW West Coast Bureau

Fox-Stanley Photo Products, Inc. relies exclusively on a third-party maintenance firm to service the IBM Personal Computers in the 153 photo finishing labs the user operates in 22 states.

For the rest of its in-house hardware, however, the San Antonio-based vendor of photographic supplies and photo finishing services obtains its maintenance directly from the equipment's manufacturers. "We use [NCR Corp.] personnel to service our [NCR Criterion 8575] mainframe and [Data General Corp.] people to maintain our Data General machines," according to Vincent Howard, MIS vice-president for Fox-Stanley.



In its division of maintenance work load between third parties and manufacturers, Fox-Stanley typifies medium and large corporations throughout the U.S. Although the independent service market is expanding rapidly and has suddenly emerged as a subject of intense industry interest, big-name manufacturers still hold a near-monopoly in large-scale CPU maintenance.

But at the opposite end of the processor spectrum, events have unfolded quite differently, according to D. Roger MacNaughton, president of Business Development International, Inc., a Franklin Lakes, N.J.-based consulting company. Among users of personal computers and their peripherals, for example, independent service providers have already made significant inroads, even though micros have yet to progress much beyond their technological infancy.

Third parties are also doing brisk service business with operators of large networks of automated teller machines and point-of-sale terminals.

Even among owners of products as large and comparatively expensive as minicomputers, small business systems and intermediate-scale processors, the independents have established a strong market presence. Bell Atlantic Corp.'s recently acquired Sorbus division, for example, owes roughly a third of its estimated $160 million maintenance business to IBM systems ranging from System/34s to 4300s, according to Sorbus President Ron Wallace.

But at the upper reaches of the CPU performance scale — in a realm synonymous with IBM 3080-class machines — third parties are comparatively rare, except for small, local outfits and firms serving specialized market niches.

Why is independent hardware maintenance distributed so unevenly over the range of market possibilities? Why have most major third-party firms shunned some product classifications and gravitated toward others?

Part of the reason is that procurement responsibilities are increasingly being dispersed from computing professionals to nontechnical end users — two groups with often sharply divergent views about which service medium is best.

Until recently, hardware buying power rested squarely in the hands of MIS executives, who typically have long-standing relationships with particular mainframe vendors and thus are culturally predisposed to sign service contracts with manufacturers. But with the growing popularity of micros, procurement has become increasingly democratic, according to John Harnett, industry services director for TRW, Inc.'s Customer Service division.

"People other than just MIS professionals are now making the service procurement decisions, and they are not necessarily brought up in a data center mode of thinking," Harnett said. "These people are more willing to go with third-party maintenance because they don't have as much cultural baggage."

Varied servicing practices

Another reason that the independent maintenance market has proliferated so unevenly has to do with the manufacturers, whose service practices vary widely from one industry sector to the next. Some of the practices have proven a boon to the growth of third-party maintenance, while others have inhibited it.

At the large-scale mainframe end, for example, many of the major equipment vendors have erected imposing barriers that effectively bar independents from the MIS service business. With IBM, the chief impediment for would-be challengers appears to be financial. "The sheer cost of entering the IBM mainframe segment of the maintenance market is so great" that most third parties are discouraged from even trying, according to MacNaughton.

With the Bunch companies, the obstacles to third-party competition often manifest themselves differently. In an effort to repel potential poachers from their mainframe service turf, many of the Bunch vendors have become increasingly reluctant

SERVICE

from page 1

agers to rate the relative effectiveness of independent and manufacturer service.

On the subject of how the two sides compare in response time, 80% of the MIS managers rated third-party providers as good as or better than their manufacturer counterparts, MacNaughton said. Independent companies also scored impressively in critical service factors like repair time, skill of maintenance technicians and price.

Nearly all the respondents, for example, credited third-party providers with being equivalent to or lower than the vendors in pricing, while 70% of the users found the independents as fast as or faster than the manufacturers in repair time. Three-fourths of the MIS managers believed the relative skill of the independents' technicians equaled or surpassed that of the vendor technicians, MacNaughton said.

The high esteem in which customers increasingly hold independent service firms has apparently resulted more from the field's own efforts at self-improvement than from any marked deterioration in service quality among the major manufacturers.

Among the most conspicuous of the third-party firms' recent advances has been their widespread success in improving the tenure and professional maturity of both their management staffs and service forces.

"Ten or 15 years ago, if you compared a manufacturer to a third party, you found an experienced guy on one side and a novice on the other," explained John Harnett, industry services director for TRW, Inc.'s Customer Service Division. "Today, many of the third-party companies employ a lot of managers and technicians who have 10 or more years of industry experience, which increases the expertise that can be brought to bear on maintenance problems."

With expanded resources have come heightened industry awareness of the third-party sector's existence and an increased willingness by users to consider alternative sources of hardware repair, he added.

However, the independent maintenance field's growing legitimacy does not portend a mass defection of customers from the manufacturers' national service organizations, noted Rawlin Fairbaugh, acting president of the Fort Meyers, Fla.-based Association of Field Service Managers.

"Most users are extremely loyal to the vendors [that] sell them their equipment," he said. "As long as the manufacturers continue to do a good job of servicing their products, customers will be reluctant to stray."

Manufacturers hold some potent trump cards for perpetuating their existing service business and keeping hungry third-party providers at bay. One such card is the strong desire among most users to ensure some form of vendor accountability.

"Knowing that a piece of equipment is made and serviced by the same firm gives you that warm, fuzzy feeling that allows you to sleep at night," according to Vincent Howard, MIS chief at Fox-Stanley Photo Products, Inc. of San Antonio.

Another inherent strength of manufacturer service organizations is that they enjoy ready access to critical spare parts — a claim that third-party providers are sometimes hard-pressed to match, Howard said.

But the independent maintenance companies also wield some effective trump cards of their own. For one, they offer a single-source solution to hardware maintenance problems and thus immunize multivendor installations from potentially destructive finger pointing, Fairbaugh said.

COMPETE

from page 16

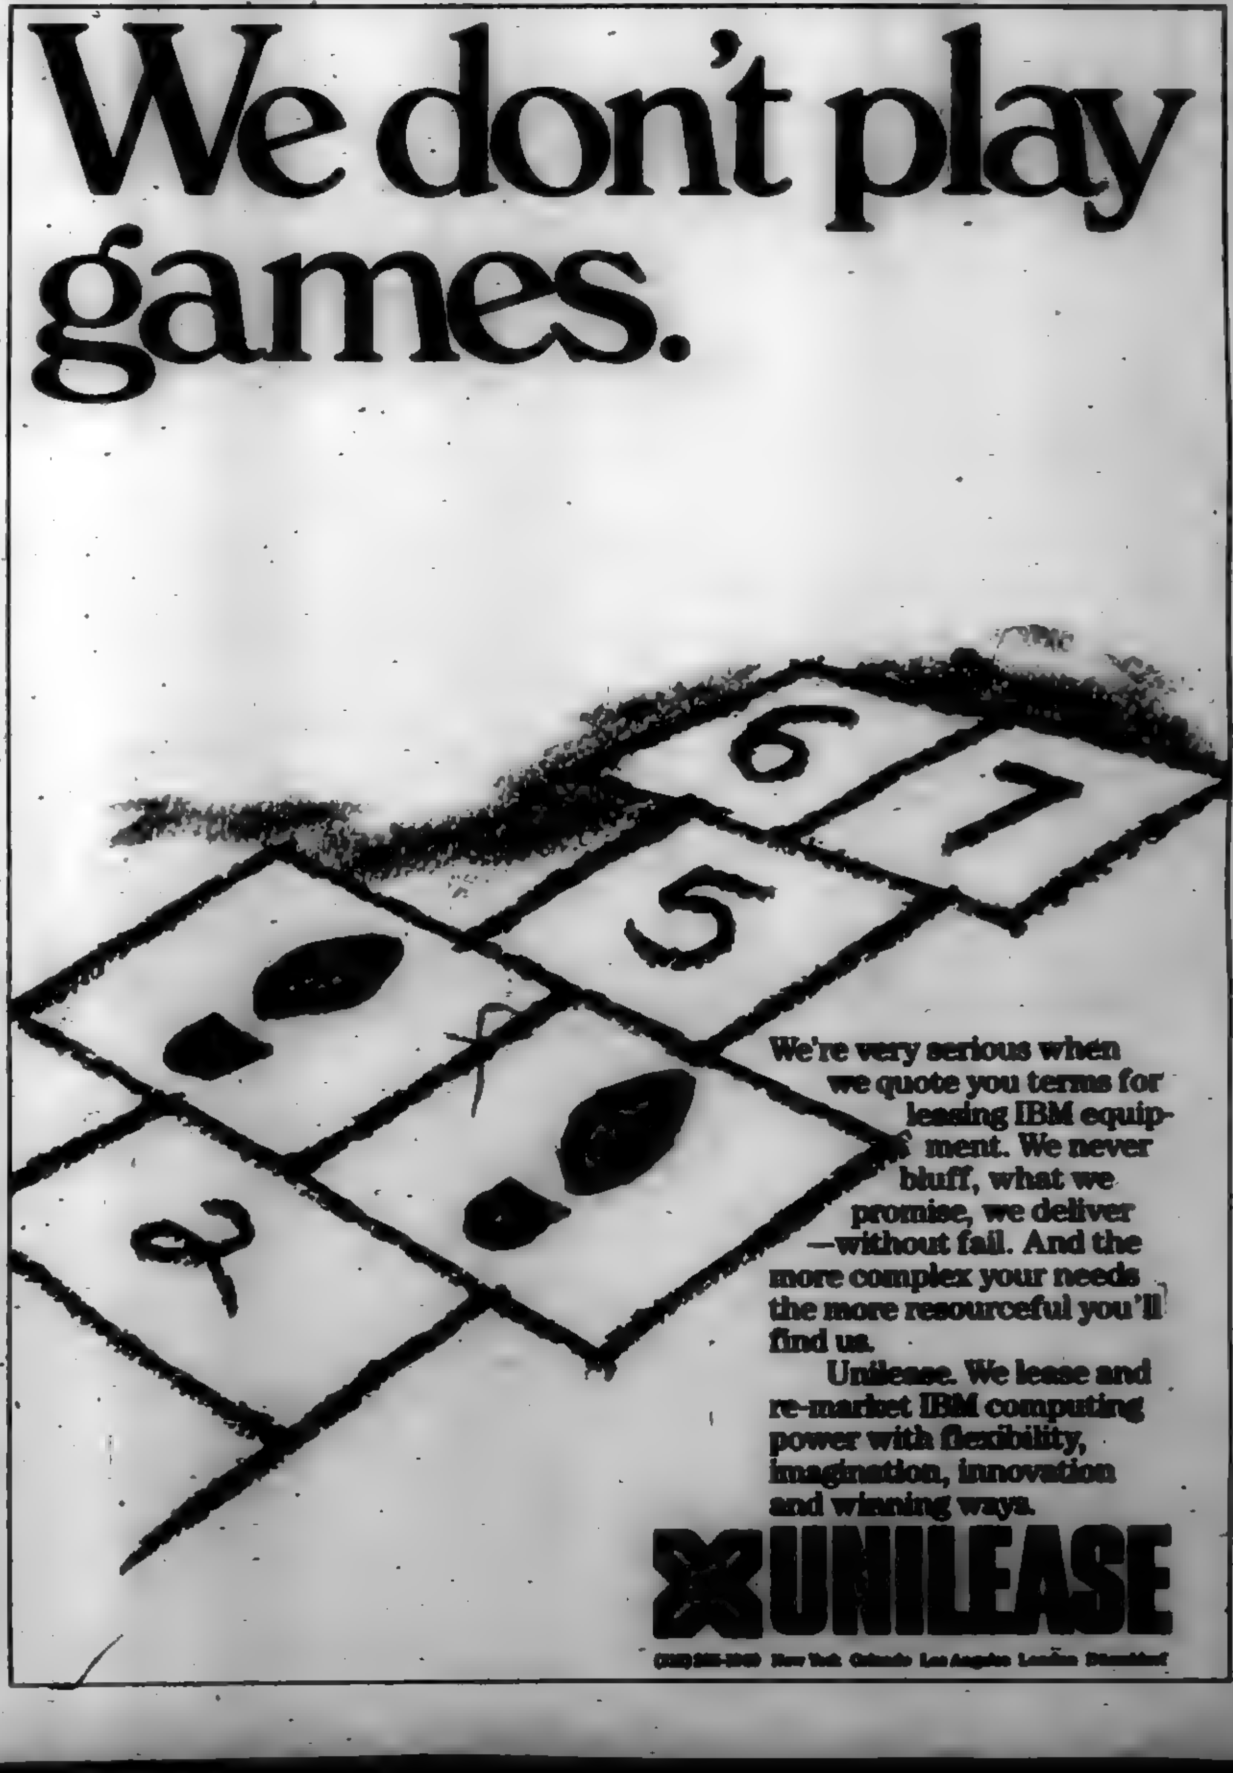
to supply independent maintenance companies with needed spare parts, MacNaughton said.

Low-end market hospitable

At the low end of the product spectrum, by contrast, third parties have found market conditions comparatively hospitable. Because of severe profit pressures within their manufacturing operations, most microcomputer equipment makers lack the financial wherewithal to build their own national service organizations.

In leaving users to fend for themselves, the vendors, in effect, have abandoned one of the maintenance field's fastest growing sectors to a host of third parties, which have pounced on the opportunity with relish.

Moreover, until just a year or so ago, most major hardware makers steadfastly refused to maintain other manufacturers' equipment, even if their own gear and the foreign products formed part of the same mixed-vendor system. That policy, too, led to a lucrative market opening that has contributed heavily to the independent service business' new-found prosperity.



We don't play games.

We're very serious when we quote you terms for leasing IBM equipment. We never bluff, what we promise, we deliver —without fail. And the more complex your needs the more resourceful you'll find us.

Unilease. We lease and re-market IBM computing power with flexibility, imagination, innovation and winning ways.

Independent maintenance market: Small fish, big pond

By Jeffry Beeler
CW West Coast Bureau

Hardware manufacturers are scrambling to enter it. Customers are increasingly evaluating it. And market pundits are tirelessly analyzing it.

But amid the growing activity, one salient fact about the third-party service field has been consistently downplayed: Independent maintenance remains a fairly paltry market.

The hoopla that has recently descended upon the third-party maintenance sector is all out of proportion to its current sales potential, according to D. Roger MacNaughton, president of Business Development International, Inc.

Even by the most optimistic estimates, the combined revenues of all the third-party maintenance business' current players total about $1.2 billion.

Although about 300 vendors now crowd the third-party marketplace, even the largest of these are small by computer industry standards.

Xerox Corp., for example, only recently joined the growing parade of third-party maintenance providers. With an annual service business calculated at $18 million, however, the firm ranks 10th in revenue among the industry's many participants, MacNaughton said.

For the others of the top 10 independent service suppliers, the same principle applies: Each is owned by a giant parent company whose total revenue dwarfs the financial contributions of its maintenance subsidiary.

Although the field is thought to be expanding at 15% per year, its climate is becoming increasingly competitive, MacNaughton said. One reason for the mounting difficulty is that hardware reliability has improved dramatically and thus has significantly trimmed the number of opportunities for revenue-generating service calls.

Another reason is that during the past year the third-party maintenance arena has turned into a magnet for a growing number of formidable competitors.

Prominent among the stream of recent arrivals are several big-name hardware manufacturers that had hitherto minded their own service business and had left the rest of the maintenanc*q* market alone. Early this year, for example, Digital Equipment Corp. disclosed its intention to begin servicing foreign peripherals that are attached to its own processors.

Honeywell, Inc. has also entered the third-party maintenance market, first by signing a service agreement with Apple Computer, Inc. and then by announcing — on May 31 — a similar arrangement with Convergent Technologies, Inc.

Market shaken to its core

IBM recently got into the independent service act when it revealed a plan to maintain competitive gear operating in concert with Big Blue's micros. But the recent market event that shook the third-party maintenance business to its core was the complex transaction that paved the way for Bell Atlantic Corp.'s acquisition of Sorbus, Inc.

Partly because it involved large dollar amounts, the deal created a national sensation and immediately turned independent service into an industry fad, MacNaughton said.

How the third-party maintenance business will ultimately react to the steady influx of major hardware manufacturers remains to be seen. "The market is probably growing fast enough to support almost everyone," according to Sorbus President Ron Wallace. "The guys with the big bucks and big organizations will capture their share of business, and the real little guys that operate in one city will continue to do well, too. But the middle-size companies are in danger of getting squeezed out."

AMA plans information systems meet

NEW YORK — The American Management Associations (AMA) here has announced that its "Long-Range Information Systems Planning" seminar will be held June 17-19 in Boston.

The seminar will address techniques for determining priorities of management and users, linking data processing strategies to corporate needs, demonstrating cost effectiveness, evaluating hardware and software, setting measurable objectives, adopting procedures that provide for optimum use of data and refining plans to meet changing needs.

The course leader is Michael Albrecht Jr., president of M. Albrecht Jr. & Associates, Inc., a Michigan-based management consulting firm.

Course registration fees are $775 for AMA members and $890 for nonmembers.

More information is available from the AMA at 135 W. 50th St., New York, N.Y. 10020.

ONE BIG REASON WHY OVER 800 LARGE NETWORK USERS WORK WITH NCR COMTEN TODAY:

TOMORROW.

Because tomorrow *does come.* Only too soon. That's why more than 800 data communications network users have chosen, and continue to work with, NCR Comten. Our systems anticipate the day *after* tomorrow.

In our long-range planning, we know that growth and change are the only constants with which our customers must deal. As a consequence, we design network systems capable of handling new technologies and services as they emerge. Not only do we help you reduce initial system costs, we also help you preserve that substantial investment when tomorrow dawns.

Planned non-obsolescence is just part of the NCR Comten story. More reasons will be found in our special executive briefing. FCC modifies equal access arrangement

WASHINGTON, D.C. — The Federal Communications Commission modified its equal access implementation May 31 and immediately ordered all customers to choose by ballot their long-distance carrier. Customers who do not choose will be allocated to a carrier based on a percentage formula of those voting.

The action came in response to complaints by MCI Communications Corp. that the automatic assignment of default customer traffic to AT&T Communications under existing rules was not a fair practice to encourage development of a competitive marketplace [CW, June 3]. The FCC called the previous arrangement "unreasonable and discriminatory" and said AT&T had enjoyed a "distinct advantage."

MCI reportedly was pleased with the FCC action, which takes effect immediately.

Approximately 10% of the local exchanges in the country have been converted to equal access, making it possible for phone customers to avoid dialing extra digits if they select a carrier other than AT&T. The implementation of equal access was ordered as part of the AT&T breakup.

The FCC action came after statistics showed that between 30% and 70% of customers were not making a choice of a carrier when an exchange was converted to equal access.

The new rules will require the local telephone company to send ballots to customers 90 days prior to an equal access cut-over. A second ballot would be sent if no reply was received 45 days before cut over. The last chance for a customer to presubscribe would be 30 days before cut-over.

The FCC said the local telephone company could not allocate any defaulted customer to a carrier until 45 days before the cut-over at the earliest or 90 days after the cut-over at the latest. A customer would have six months after the cut-over to make a free selection change in their long-distance carrier.

Coalition forms VDT info center

WASHINGTON, D.C. — A coalition of VDT manufacturers and businesses that use VDTs recently announced the formation of the Center for Office Technology, which will provide information and educational programs about VDTs, office automation and ergonomics.

Leonard H. Zippin, chairman of the center, said it replaces the Coalition for Workplace Technology, which was backed by the Computer and Business Equipment Manufacturers Association (Cbema) and which frequently lobbied in state legislatures against VDT regulations. Zippin said the new center is expected to have more credibility because it is supported by businesses that use VDTs and by VDT manufacturers.

He said the center will have a broader mandate than the former coalition and will not undertake any legislative lobbying itself. Instead, Zippin said, the center will provide generic educational materials and studies to in-state coalitions that lobby on VDT issues.

To act as national clearinghouse

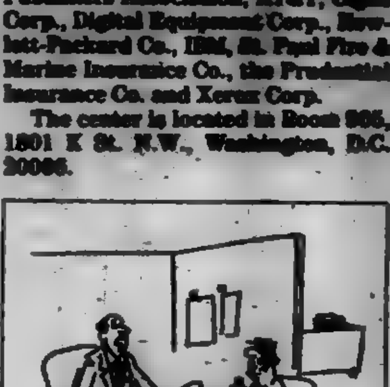
The center will act as a national clearinghouse for information on scientific studies on office automation, handle news media inquiries and provide workshops for private and government employers nationwide, Zippin said.

"Many private and public sector managers have planned and implemented excellent programs for introducing and using computer systems. Our goal is to build upon this knowledge and make it available to others," he said.

Zippin is executive vice-president of the American Insurance Association, one of the business groups supporting the new center.

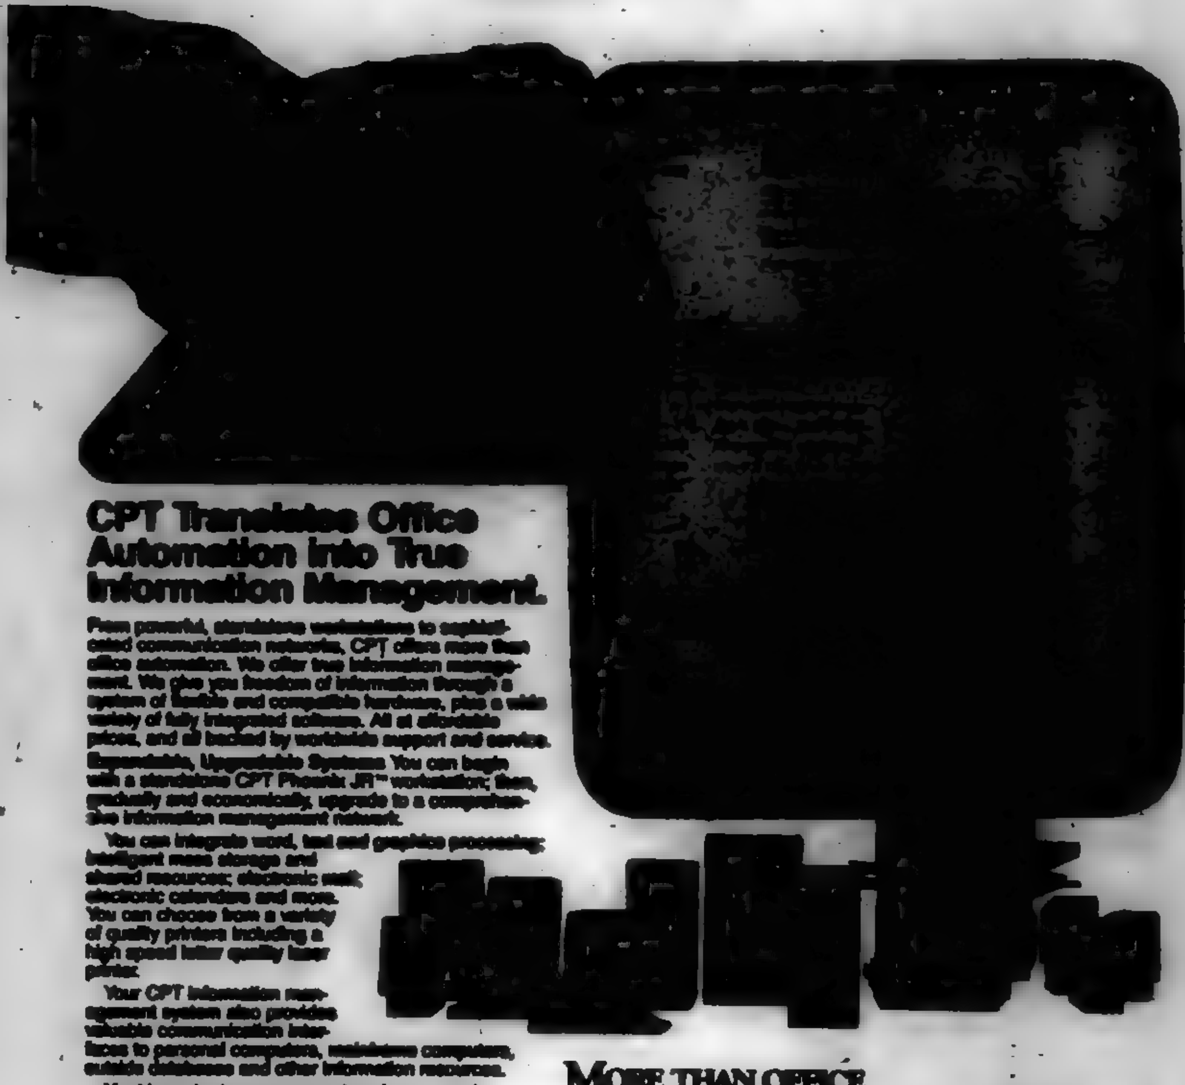
In addition to Cbema and the insurance association, other supporters include Aetna Life & Casualty Co., the Air Transport Association, the American Council of Life Insurance, the American Electronics Association, the American Newspaper Publishers Association, AT&T, Cigna Corp., Digital Equipment Corp., Hewlett-Packard Co., IBM, St. Paul Fire & Marine Insurance Co., the Prudential Insurance Co. and Xerox Corp.

The center is located in Room 905, 1801 K St. N.W., Washington, D.C. 20006.



"I fed your qualifications into the computer and it suggested that you apply for federal disaster funds."

FREEDOM of INFORMATION



CPT Translates Office Automation into True Information Management.

From powerful, standalone workstations to sophisticated communication networks, CPT offers more than office automation. We offer true information management. We give you freedom of information through a system of flexible and compatible hardware, plus a wide variety of fully integrated software. All at affordable prices, and all backed by worldwide support and service.

Expandable, Upgradable Systems You can begin with a standalone CPT Phoenix JR™ workstation; then, gradually and economically, upgrade to a comprehensive information management network.

You can integrate word, text and graphics processing; intelligent mass storage and shared resources; electronic mail; electronic calendars and more. You can choose from a variety of quality printers including a high speed letter quality laser printer.

Your CPT information management system also provides valuable communication interfaces to personal computers, mainframe computers, outside databases and other information resources.

Most important, you can meet each new requirement without costly conversions or major operator training.

A Pioneer – and Still Ahead CPT pioneered office automation. Now we're the leader in providing true information management. Find out how CPT gives you freedom of information. For your nearest CPT dealer call 800-447-4700 ask for CPT.

MORE THAN OFFICE AUTOMATION...
IT'S INFORMATION MANAGEMENT...

Freeing business from computer languages first began with Computer Corporation of America.

But keep it quiet. We did.

We're making it easier for management and computers to talk direct. Quietly and easily.

After all, our founders over 20 years ago were a computer scientist and a psychologist. So our focus literally began with creating software that let people more easily communicate with computers.

And our first contribution was the earliest example of fourth generation language.

One of the latest, is the Intelligent Information Center. And with it, your business executives can use their personal computers to access and use the firm's mainframe computer data direct.

To speak in slightly technical terms, the IIC is a language free, decision support query and report writing system that's menu driven and syntax free. In fact, it's just about keyboard free.

Your executives can write their own reports or use mainframe data on their favorite spreadsheet in the office or at home.

The Intelligent Information Center is already proven in industry use, to be a very powerful, very flexible link between mainframes and people. The non-computer-expert type of people.

Just like our founders would have wanted.

We'd like to tell you more about our advanced technology, from our very powerful MODEL 204 database software, to our other application development tools for business.

Write John Donnelly, VP Marketing, Computer Corporation of America, Four Cambridge Center, Cambridge, MA 02142. Or call 1-800-258-4100.

Software innovators creating better ways [illegible]

Target specific markets, software conference advised

CW AT
MIM '85

By [illegible]
CW Staff

MONTREAL — The software industry has a hard lesson to learn from earlier fast-growth industries, namely the importance of market share.

David Fairbairn, director of the National Computing Center in Manchester, England, told attendees at the Montreal International Software Market, Inc. (MIM) '85 that in order to withstand the pressures of a mass market, software companies must carefully categorize and understand their markets. The conference, titled "Software Marketing in the Global Village," was the first conducted by MIM, a private company jointly supported by the provincial government of Quebec and the Canadian national government.

In his speech, Fairbairn said today's software market is characterized by segmentation, massive sales volume and a need for product "robustness."

Custom software for mainframe applications remains the largest part of the software market, according to Fairbairn. To be successful, tomorrow's applications must be user-oriented and have a low development time, he said. "Software tool kits," or program generators that help companies develop such applications, will be a particularly important area over the next few years, according to Fairbairn. "System tools and program generators will be the most competitive areas" and will increase programmer productivity by four or five times, he said.

Massive production of software utilities and applications products will continue, but development costs will increase, Fairbairn said. Sales volumes, however, will offset those development costs, he said. "In 1980, products costing $500 would cost as much to produce as those that cost $5,000." Tomorrow's products will cost "two or three times as much to develop and bring to market," he said.

Multisystem software such as AT&T Unix products will see more growth over the next few years, according to Fairbairn, who said Unix-based products will capture 20% of the UK market in five years, compared with 8% penetration today.

Cries for standardization and integration of capabilities will continue, he said.

According to Fairbairn, software training needs will diminish as more products incorporate better Help facilities and tutorial packages.

Like other fast-growth industries that once worked with limited operations in a mass market, the software industry will eventually come into its own through the creation of diverse marketing channels that emphasize vertical markets, Fairbairn said. "[The software industry] is following a pattern, but the difficult task is finding out where we stand in that process," he said.

End-user DP focus of meet

BOSTON — The Society for Information Management (SIM) will present its annual conference — this year titled "Managing the Explosion: End-User Computing and Emerging Technologies" — Sept. 8-12 at the Marriott Long Wharf Hotel here.

The conference will feature workshops on understanding the value, management and use of technology for managing the explosive growth of end-user computing. Registration fees are as follows: conference and workshop, $1,175 for SIM members; $600 for SIM faculty members; and $1,295 for nonmembers; conference only, $895 for SIM members; $450 for SIM faculty members; and $995 for nonmembers; workshop only, $350 for SIM members; $250 for SIM faculty members; and $395 for nonmembers.

More information can be obtained from SIM Annual Conference, c/o Kimberly Gandia, Suite 600, 111 E. Wacker Drive, Chicago, Ill. 60601.

Pick software directory out

SAN DIEGO — The International Data Base Management Association (IDBMA) has released the fourth edition of its Application Software Directory for the Pick Systems Pick operating system.

The directory details 630 applications software packages that run on the Pick operating system and lists 58 consultants who specialize in the Pick operating system.

The IDBMA Application Software Directory costs $30 plus $3.50 for shipping and handling. It is available from the IDBMA, 9740 Appaloosa Road, San Diego, Calif. 92131.

Exxon sees site licensing pact slicing software costs

By Edward Warner
CW Staff

HOUSTON — Exxon Corp.'s Exploration Division recently signed a site licensing agreement for personal computer software with Command Technology Corp. (CTC) that will reportedly save the oil company $13,600 in its first year. The agreement is a first both for CTC and Exxon.

The license, for CTC's SPF/PC programming utility, will permit the division to distribute an unlimited number of copies of the package — including copies for home use — to users of the division's approximately 125 IBM 3270 Personal Computers.

> ***The license agreement is unique in that for one price — $6,000 annually — it permits the Exploration Division to run the package on all the CPUs at Exxon's data center.***

Personal Computer users in Exxon Exploration's five subdivisions will also have a crack at the software, provided they have a valid business reason to use it, according to Michael Beddingfield, the division's supervisor of operating systems.

The software, for off-line programming of IBM's ISPF screen builder, will be downloaded to users from an IBM 3081 Model K mainframe, one of two at the division's DP center here.

The license agreement is unique in that for one price — $6,000 annually — it permits the division to run the package on all the CPUs at its data center, Beddingfield said. Mainframe site licenses usually are sold on a per-CPU basis.

A site license for personal computer software can permit the making of unlimited copies of a program, which would otherwise violate the software's copyright.

Seeking to avoid copyright problems, corporate personal computer managers, through groups like the Microcomputer Managers Association, have been demanding that software vendors create site licenses.

Without a site license, Beddingfield claimed, it becomes "unmanageable for a large corporation to manage the personal computer [software] usage."

For CTC, the use of site licensing "gets us out of the shipping business [and] allows us to work on code development," CTC President Barry Patton said.

Site license growth seen

Exxon was about the 15th corporate user to approach Patton's Oakland, Calif.-based software firm about a site license, the CTC president said. He added that, although CTC will still sell single copies, it expects its site license sales to grow.

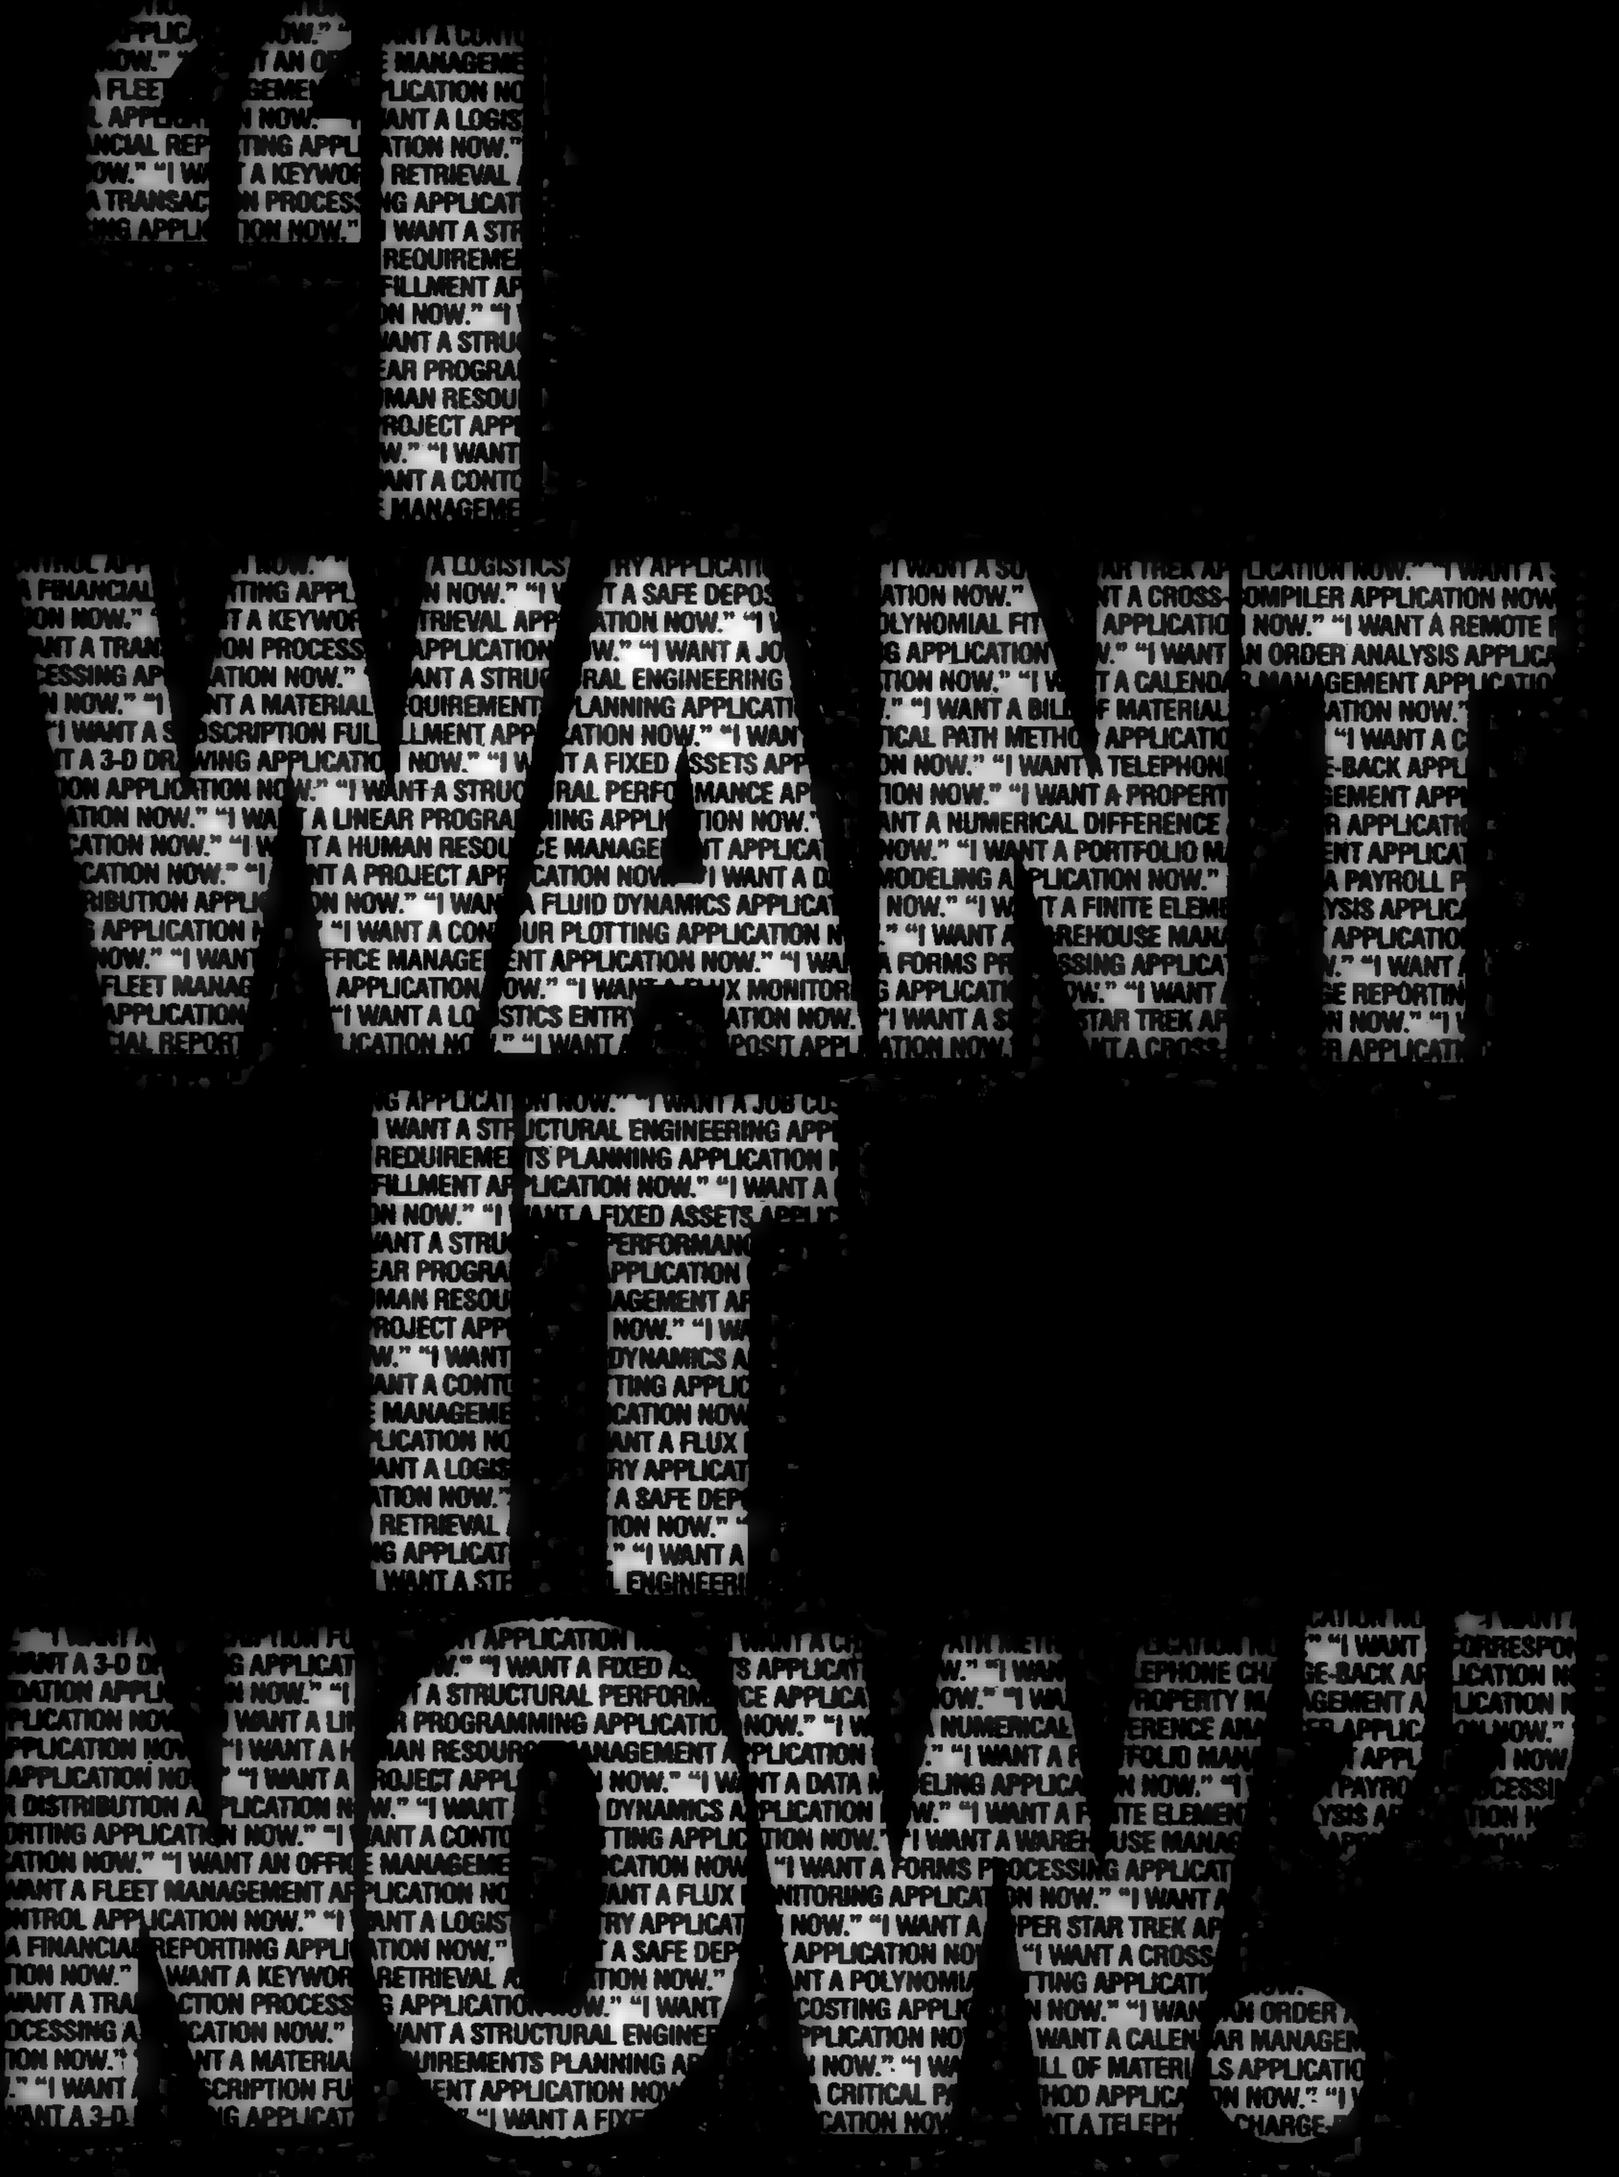
Exxon's three-page contract with CTC, which was signed May 31, will save the Exploration Division about $13,600 in its first year, Beddingfield predicted.

That estimate, he said, was arrived at by multiplying the 80 copies of SPF/PC that have so far been requested by users by $245, the package's single-copy price, plus a $50 current-user upgrade charge. The software, he said, has been enhanced an average of twice a year.

The SPF/PC package will come into use this month in a pilot test with users, Beddingfield explained. Host-based ISPF screens, including the needed batch commands, will be written to make downloads "as user-friendly or idiot-proof as possible," he added.

Though the agreement was a first for Exxon, a company spokesman said the firm is currently exploring the possibility of gaining personal computer site licenses from other vendors.

Introducing letter quality at lightning speed.



"I WANT IT NOW."

VMS. WHEN THE ONLY THING YOUR USERS WANT IS EVERYTHING, NOW.

If "I want it now" seems like the only thing you ever hear from your users – and if your applications backlog is telling you that "now" is going to be a long way off – you need to know about our VMS™ Virtual Memory System software.

Our VMS software, which was designed exclusively with VAX™ computer systems, is far more than a mere operating system. It is a complete operating *environment*. One that can encompass all the ways you use computers. To get it done, now.

The VMS operating environment provides you with the industry's most complete set of utilities and software products for program development and system management. Interactive, realtime, even background batch applications can be developed with ease and speed.

Everything you need for corporate-level applications is included. Advanced office automation software. Proven transaction processing capabilities. Comprehensive CODASYL-compliant and relational database managers. User-friendly query tools and an integrated data dictionary. Plus the industry's most complete set of local and wide area networking facilities, allowing you to exchange data files and cooperate with systems made by IBM – via SNA gateway – as well as many other vendors.

THE VMS OPERATING ENVIRONMENT

VMS PUTS YOUR PROGRAMMERS IN THE FAST LANE.

You've heard a lot of promises about increasing programmer productivity over the years. After all, the application backlog in most companies has reached 18 months to 2 years. And the demand for new applications is increasing by some 50 percent a year. So there's hardly a more important subject.

Digital's VMS software does more to increase programmer productivity than any other system can. Because it combines everything you need for application design, development and maintenance into a single, integrated operating environment.

You'll have the industry's best symbolic debugger to work with. A command language so flexible it lets you stop application execution and enter new commands at any point, and even develop your own commands through its macro facility. A common runtime environment that lets you reuse code instead of rewriting it. And more advanced languages than any other system – some 16 in all, including Ada,® C, COBOL, FORTRAN, and Lisp – all of which you can combine in a single program through the common calling standard.

This gives you a distinct advantage in team development projects. Each developer can use the language best suited to his or her talents and to the task. The end result – better code in less time.

The point is, the VMS environment simplifies development not only for small, ad hoc projects – but also when your applications reach highly sophisticated, complex levels.

And with more than 2,000 applications now available from Digital and independent vendors, you begin to know why our VMS environment does more than any other system to give your company satisfied, productive users at every level.

WITH VMS, FLEXIBILITY IS BUILT IN.

You get another big advantage when you develop your applications with the VMS operating environment: the range of hardware you can run them on. Namely, our VAX computer family, the industry standard for 32-bit computing.

The VMS environment spans the entire VAX systems family, from the smallest MicroVAX™ system to the largest VAX 8600™ and multiprocessor VAXcluster™ systems. This is the biggest software-compatible growth path in the world. And with the data security mechanisms built into VMS software, increased access doesn't mean compromised security.

What's more, if you need UNIX® software capabilities, the VMS operating environment can readily provide them through the VNX™ option. Your choices are never limited when you start with the VMS environment.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

Digital's VMS operating environment, like all Digital hardware and software products, is engineered to conform to an overall computing strategy. This means that our systems are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy direct from desktop to data center.

For more information about how our VMS operating environment can help you cut your applications backlog, contact your local Digital sales representative. Or call 1-800-DIGITAL, ext. 219.

THE BEST ENGINEERED COMPUTERS IN THE WORLD.

New Hampshire leaders wrestle with data access issue

By [illegible]
CW Staff

CONCORD, N.H. — The branches of government in New Hampshire have reached an uneasy compromise as to who should and should not have access to computerized financial information.

The state will have completed the installation of an integrated financial system by July 1, said Norman VanderNoot, director of communications for Gov. John Sununu's office. When that system is installed, Sununu wants veto power over who has access to its data base, he said.

To a bill addressing issues related to the new system, Rep. V. Michael Hutchings (R-Plymouth) amended a request to reflect what he said are the access rights and privileges legislators already have on paper and should have electronically.

The bill passed in the legislature, but the senate amended it so that the governor would have veto power. This was done after the governor made it clear he did not favor legislative access, said Wayne King (D-Rumney).

The legislature and senate then worked out a compromise that will allow legislative access only through an employee of the legislature — the budget assistant, he added.

King is working on developing guidelines to allow New Hampshire citizens, as well as legislators, to have access to all parts of the data base that are not confidential, he said. He is also trying to consolidate all state computerized information, such as the financial system, statistical information on aid to families with dependent children programs and game management programs so that all the state's records will be together, making it easier to access needed information, he said.

"I don't see me winning that in the next round," King said. He said he hopes his efforts will lead to discussions and maybe to a pilot program, such as a few terminals set up in a state library for citizens to access information, he said.

The governor feels that legislators can get anything they want on paper or by phone, VanderNoot said, and should not have access to the data base. Information can be — and has been — misinterpreted in the state, he said, a problem that could increase if too many people have access to the records.

"This is not a partisan issue," Hutchings said, but a balance of power issue. The executive branch would have the upper hand if Sununu's wishes prevailed, he said. "Can we change from paper to computers and still keep the fine balance of power?" he asked.

"We're really talking [about] information as power here," King said. Information can be liberating if it is shared or enslaving if it is closely held by a few people, he said. He said he does not want to see the governor with veto power over who can access the data base. A governor with veto power over data base access could end up giving timely information only to "yes-men," he said.

IBM software strategies topic of forum

MONTEREY, Calif. — IBM's software strategies will go under the microscope when the Gartner Group, Inc. holds its second annual Software Forum, entitled "Software Strategies for the IBM World," at the Hyatt Regency Hotel here June 24-26.

The forum will investigate key trends in the software industry, and Gartner Group speakers and others will provide insights into IBM software strategies in such areas as operating systems, communications, applications and data base management systems. Among the speakers will be Scott Smith, vice-president, the Gartner Group; Fran Tarkenton, chairman of Tarkenton Software, Inc.; Gideon Gartner, president, the Gartner Group; and John Steuri, general manager of IBM's Information Services Group.

Topics of discussion are scheduled to include the following: "Can IBM recover lost ground in DBMS and applications software?"; "PC software — the next generation"; "Departmental computing — pipe dream or panacea?"; and "Programmer productivity — is help in sight?"

Conference fee is $875.

More information is available from the Gartner Group, 72 Cummings Point Road, Stamford, Conn. 06902.

"This model has every new accessory and feature we offer — including several we haven't even figured out yet."

NOW IT ONLY TAKES ONE TO TANGO.

Say hello to PhoneMail™ and say hello to the One Party Phone Call. No more waiting for the phone to ring, waiting for someone on the other end, waiting for your telephone partner in another city, another meeting, another time zone. Waiting.

PhoneMail is not your basic phone answering gadget.

It's a digital voice-messaging system for your entire company that you can access from any Touch Tone* telephone anywhere in the world, any time.

PhoneMail can answer your phone with your personal greeting. (If you'd prefer, your secretary can take the call and direct the caller to PhoneMail.)

It will let you answer messages automatically. It can forward them, along with your comments, to dozens of your associates. It lets you send messages to a whole roster of

INTERNATIONAL REPORT
CW International
News Network

DENMARK

COPENHAGEN — Communications giant ITT will invest $140 million in communications research and development efforts here, the company said. The investment is expected to create 1,000 jobs and generate increased export capital. Most of the companies receiving ITT funds are owned in part by ITT, including Standard Electric Kirk, producers of telecommunications equipment, private branch exchanges and electronic components; Christian Rovsing A/S, manufacturer of data communications and turnkey systems; and RC Computer, a systems manufacturer.

JAPAN

TOKYO — Two automatic language translation packages have been announced here. Toshiba Ltd.'s Machine Translation System reportedly allows users to translate English to Japanese, arranging the meaning of the sentences according to grammar. The translation system features 3,000 basic words, translates at 5,000 words per hour and runs on the vendor's UX-700 under its version of AT&T's Unix.

NEC Corp. announced an English-to-Japanese/Japanese-to-English translation system called Pivot, which runs on NEC's Acos mainframe series of processors. Pivot, which reportedly uses artificial intelligence to analyze sentences in the translation process, is expected to ship in December and will lease for $2,000 per month.

■

TOKYO — Nippon Telephone and Telegraph (NTT) announced it will offer a voice-mail service within the next two years. The service will enable users to record their voice messages if calling a busy telephone line, and messages will be forwarded automatically when the line becomes free, a spokesman said. The service can also transmit messages to many receivers simultaneously and send messages at specific times and dates. The NTT system reportedly will also feature a news service. Now being tested, the system supports digital and push-button phones, NTT said.

NORWAY

TRONDHEIM — Norwegian users of Digital Equipment Corp. systems formed an autonomous arm of DEC's Users Society (Decus) during a recent Decus convention here. Some 600 Norwegian users elected an advisory board composed of representatives from the data processing, scientific and academic communities. The organization's 1985 charter will offer seminars on fourth-generation language development.

UNITED KINGDOM

HIGH WYCOMBE — A $120 million race for an air defense system contract at Royal Air Force (RAF) command headquarters is under way here. According to a Ministry of Defense spokesman, four UK companies have been given the RAF's requirements, and the contract is expected to be awarded this year.

WEST GERMANY

MUNICH — A major change in the OEM agreement between Siemens GmbH and IBM Deutschland was announced here. Siemens will reportedly continue to market IBM's large disk storage device, the 3380, but it will no longer sell only to IBM customers. It will also sell to its own customer base and that of other plug-compatible manufacturers. The OEM agreement has been in existence since February 1984 and has not been popular among IBM sales representatives, sources said. IBM sales representatives have watched their colleagues at Siemens sell the same products at 15% to 20% less than IBM's prices.

Under the terms of the agreement, IBM users in West Germany will have to go back to Big Blue's prices and will start paying a lot more for IBM equipment.

■

NUREMBERG — The 1984 balance sheet for Triumph-Adler AG, the troubled Volkswagen GmbH high-technology subsidiary, registered only bad news. Approximately $117 million was pumped into the company during 1984 to keep it going, but losses are expected for 1985 as well, insiders said. Under the terms of an OEM agreement with IBM, IBM's recently announced $545 Actionwriter 1 Typewriter will be produced by Triumph-Adler.

■

MUNICH — Siemens AG has announced a $6.6 million project to design integrated circuits intended for use in computer-aided design systems here. Siemens reached an agreement with West Germany's Society for Mathematics and Data Processing to collaborate on the research and development project and to involve various West German technical schools in the project.

■

MUNICH — The robot-manufacturing industry is betting on an annual growth rate of 30% this year, according to the Association of Robot Manufacturers here. This will primarily be due to an increase in demand from midsize industries, a group spokesman said. Some 6,600 robots were reportedly sold last year in West Germany — 40% of which went to the automobile industry.

folks. So you can forget about publishing reams of short memos. Its voice prompts guide you step by step. So there's no chance for miscommunication. Problems are solved. Decisions are moved along.

It works wonders with most any business telephone system. It'll cater to forty folks or a thousand — simply, swiftly, cost-effectively.

Of course, only ROLM has PhoneMail. That's not surprising. We're the folks who taught telephones and computers and people how to work together. We can show you the most advanced ways to manage voice and data today, next year and into the next century.

If your business phone system has you talking to yourself, it's time to talk to ROLM.

ROLM

Federal agency mining benefits from auditing system

LAKEWOOD, Colo. — A government agency is pouring between $12 million and $15 million in additional interest into the U.S. Department of the Treasury's pot each year through the use of an auditing and financial system and will add even more as the system is fine tuned.

Collecting minerals revenue paid by private industry to the Minerals Management Service (MMS) of the U.S. Department of the Interior has become more complicated in recent years, according to Robert Boldt, associate director of the royalty management program at MMS.

Boldt said the number of leases issued on federal and American Indian lands skyrocketed and as high production prices led to multiple ownership of producing mining wells.

He noted that the cornerstone of the government's program to correct long-standing problems with the royalty accounting, collection and management system is MMS' Auditing and Financial System (AFS), designed by American Management Systems, Inc. (AMS) of Arlington, Va. AFS is a fiscal and accounting system designed specifically to handle the collection of royalty payments, Boldt said.

Patched software

Until recently, MMS used the U.S. Geological Survey's Amdahl Corp. computer on a time-sharing basis, Boldt said. "The [royalty accounting system] software was over 25 years old and had been patched continuously," he said. The aging system produced confusing account statements that were difficult to interpret, he said.

The government was unable to identify or track late payments, nonpayment and underpayment. There was no way to reconcile the statements received from the lessee or royalty payer with the production reports received from the operators of a mining well, he added.

To make matters worse, the number of federal and Indian leases had increased from 11,127 in 1968 to more than 30,000 by 1983, Boldt said. Some royalty payments were taking three months to process, he added.

From 1971 to 1983, royalty collections on complex marketing agreements and pricing arrangements leaped from $480 million to $4.5 billion, an increase of more than 800%, he said.

Program consolidation

Boldt said the improved royalty management program was launched in 1980 to design AFS and a Production Auditing and Accounting System (Paas), also designed by AMS. The eight regional offices that had administered the old system were consolidated into a new facility, the Royalty Management Accounting Center, here in July 1981, he said.

Under the old system, companies submitted sales, royalty and production reports each month, Boldt said. AFS requires one report from the lease operator that consolidates the sales and royalty data, he said. Companion production reports feed Paas, which reports on production for a lease from extraction to sale, he said.

Payers for each lease are given an account identification, and every selling arrangement is pinpointed, Boldt said. Should one organization pay royalty on behalf of all the overriding interest holders, as often happens, the account is maintained for that organization, he added.

Revenue tracking

MMS can track a revenue source through the entire system from payment receipt to distribution of the royalty, Boldt said.

Each of the interest holders in a mining well may make a separate selling arrangement, and each may receive a different price for output from the same rig, he explained.

The system can identify underreporting or nonreport-

See AFS page 31

IBM's best efforts are now going into Macintosh.

Macintosh and IBM PC software. Compatible at last, thanks to MacCharlie, a rather innovative coprocessing system.

And imagine the consequences.

Nearly 10,000 IBM PC software programs designed for general business and specific applications in real estate, insurance, law, medicine, banking, etcetera, can now join forces with Macintosh's own popular programs.

And, the myriad of IBM PC-compatible software adopts Macintosh's many beloved features, including desktop utilities such as the clipboard and the calculator.

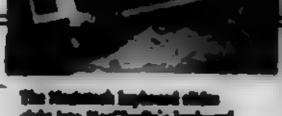
In addition, MacCharlie allows IBM PC and Macintosh data files to be exchanged. Talk about flexibility.

But the good news gets better.

You see, MacCharlie delivers hardware compatibility, as well. For example, IBM letter-quality printers can be easily used with Macintosh.

Furthermore, MacCharlie now allows Macintosh to perform virtually any networking an IBM PC can perform. Even to the extent of tying in with IBM mainframes.

In other words, your networking capability goes beyond the Apple family.



The Macintosh keyboard slides right into MacCharlie's keyboard. About as easy as slipping a letter in an envelope.

Macintosh sets snugly beside MacCharlie, as a custom-fit pedestal.

Once you plug in MacCharlie's power and keyboard cords, you're ready to enjoy a very happy marriage.

June meet to eye Mac

SAN FRANCISCO — Apple Computer, Inc. Chairman Steven Jobs and Chief Executive Officer John Sculley will be among the speakers at Macforum '85, to be held here June 26-27 at the Hyatt Regency Hotel.

The conference, which will examine Apple's Macintosh Office strategy, is sponsored by Future Computing, Inc., a Dallas-based market research firm. Other speakers will include Dennis Hayes, president of Hayes Microcomputer Products, Inc., and William Gates, chairman of Microsoft Corp.

The registration fee is $800. More information is available from Future Computing, 8111 LBJ Freeway, Dallas, Texas 75251.

PAY

from page 30

ing, and its reporting functions keep the MMS staff informed at all times on account status, Boldt said. In addition, the system will automatically identify situations where audits are warranted, he added.

Royalty distribution

The distribution of royalty amounts is recorded as soon as the sales and royalty reports are received, although actual disbursement can be made at a later date, Boldt said. As long as the total amount collected matches the amount prerecorded to be disbursed, AFS will automatically disburse royalties to the various federal agencies, states and Indian tribes, he said. When the distribution of the royalty is recorded, the amount of the windfall profit tax is also calculated, he added.

When the system was first installed, hundreds of millions of dollars were suspended each month because of an error rate of approximately 40%, Boldt said. MMS has cut the error rate to 12% and is aiming to reduce it to 5% by early 1986 because the agency ultimately must pay states and Indians interest on the payments distributed late, he explained.

Paas, now in operation with 14 companies of various sizes, gives MMS the ability to reconcile production data with sales volume and royalty payment information, further improving the agency's ability to determine the precise amount of royalty due from a lease, Boldt noted. Paas will compare what the royalty payer says was sold with what the operator of a mining well says was produced, he said.

Bonus accounting

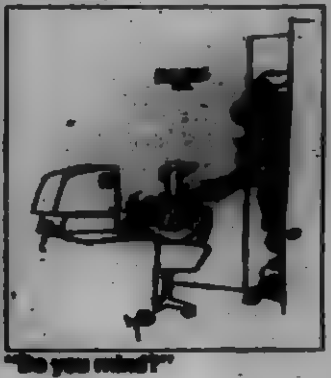
The Bonus and Rental Accounting Support System (Brass) evolved during the development of AFS and Paas when the responsibility for bonus and rental accounting for domestic minerals was transferred from the Bureau of Land Management to MMS, Boldt said.

Brass tracks information on approximately 144,000 nonproducing leases, he said, and computes how much is due in rents for each. It is compatible with AFS and adds its data to the AFS data base as each lease begins producing — when rentals end and royalties start — so that collection and accounting for royalties can begin.

AFS, Paas and Brass run on six Digital Equipment Corp. VAX-11/780 computers, Boldt said. Three are needed for AFS, one is used for testing and development and Brass and Paas run on one each of two that belong to MSS but are located at AMS' facilities, he added.

The systems are helping to eliminate underreporting, estimated at 1% to 2%, or $100 million to $150 million, per year, which Boldt said he ultimately hopes to recover.

"The main problem with the system is lack of capacity," he explained. "There is not enough on-line time, and our production cycles consume almost all the available batch mode time." MMS now has a request for proposal out for a mainframe so that it can handle all the modules on one system.



"Do you mind?"

How does it happen? As easily as slipping on penny loafers.

In mere moments, MacCharlie combines the best features of the world's premier personal computers.

And despite the fact that it turns one computer into two, MacCharlie adds but a handful of square inches to Macintosh's physique.

In short, one of life's most perplexing decisions—whether to buy a Macintosh or an IBM PC—can now be made with the greatest of ease.

Ask for MacCharlie at your local computer store. Suggested retail price for the 256K single disk drive model is only $1195, and just $1895 for the 640K dual disk drive version.

For more information, call Operator 16 toll-free, 1-800-531-0600. (In Utah, call 801-531-0600.)

TURNAROUND TIME

Larry Long

Q A month ago I hired a consultant who professed to be an expert in microcomputers and office automation.

She just submitted a bill for $6,000 covering the first month's work — I fired her on the spot. She was to have helped us establish a microcomputer policy, use her technical expertise to help us network clusters of micros and set up an educational program to help our users become more comfortable with personal computers.

She spent a lot of time on-site talking with almost everyone in the company and "reviewing" (I think learning) our software packages. For our $6,000 she has "a good understanding of what we do."

We assumed that she was on track and about ready to put everything together. But as of two days ago, she had nothing to show us. It was then that we realized that we were getting nowhere with this consultant. Is there any recourse to hiring an incompetent consultant?

If it's not too late, don't pay her. Otherwise, write the fee off as a contribution to experience and plan to be more involved with the next consultant's activities.

The next time you retain a consultant, make it clear that you expect results. If you are paying top dollar for experience and know-how, you should see some visible signs of progress each day.

For example, a good consultant would have examined needs and prepared a draft microcomputer policy for your review by the end of the first week. Total billable time for such an activity should be between one and two days.

Q My staff and I give presentations almost daily to users groups, the systems advisory committee or management on topics ranging from technology updates to budget proposals. Most of the meetings are no more than 1½ hours long. People have complained that we don't allow enough time for questions. How much time should be set aside for questions and answers?

The amount of time that you would allocate for interaction is directly proportional to the level of the audience. When making a presentation to top management, set aside about 60% of the planned time for direct interaction. Set aside 40% of the presentation time for interaction during mid-level management presentations and 20% for presentations to operational-level personnel.

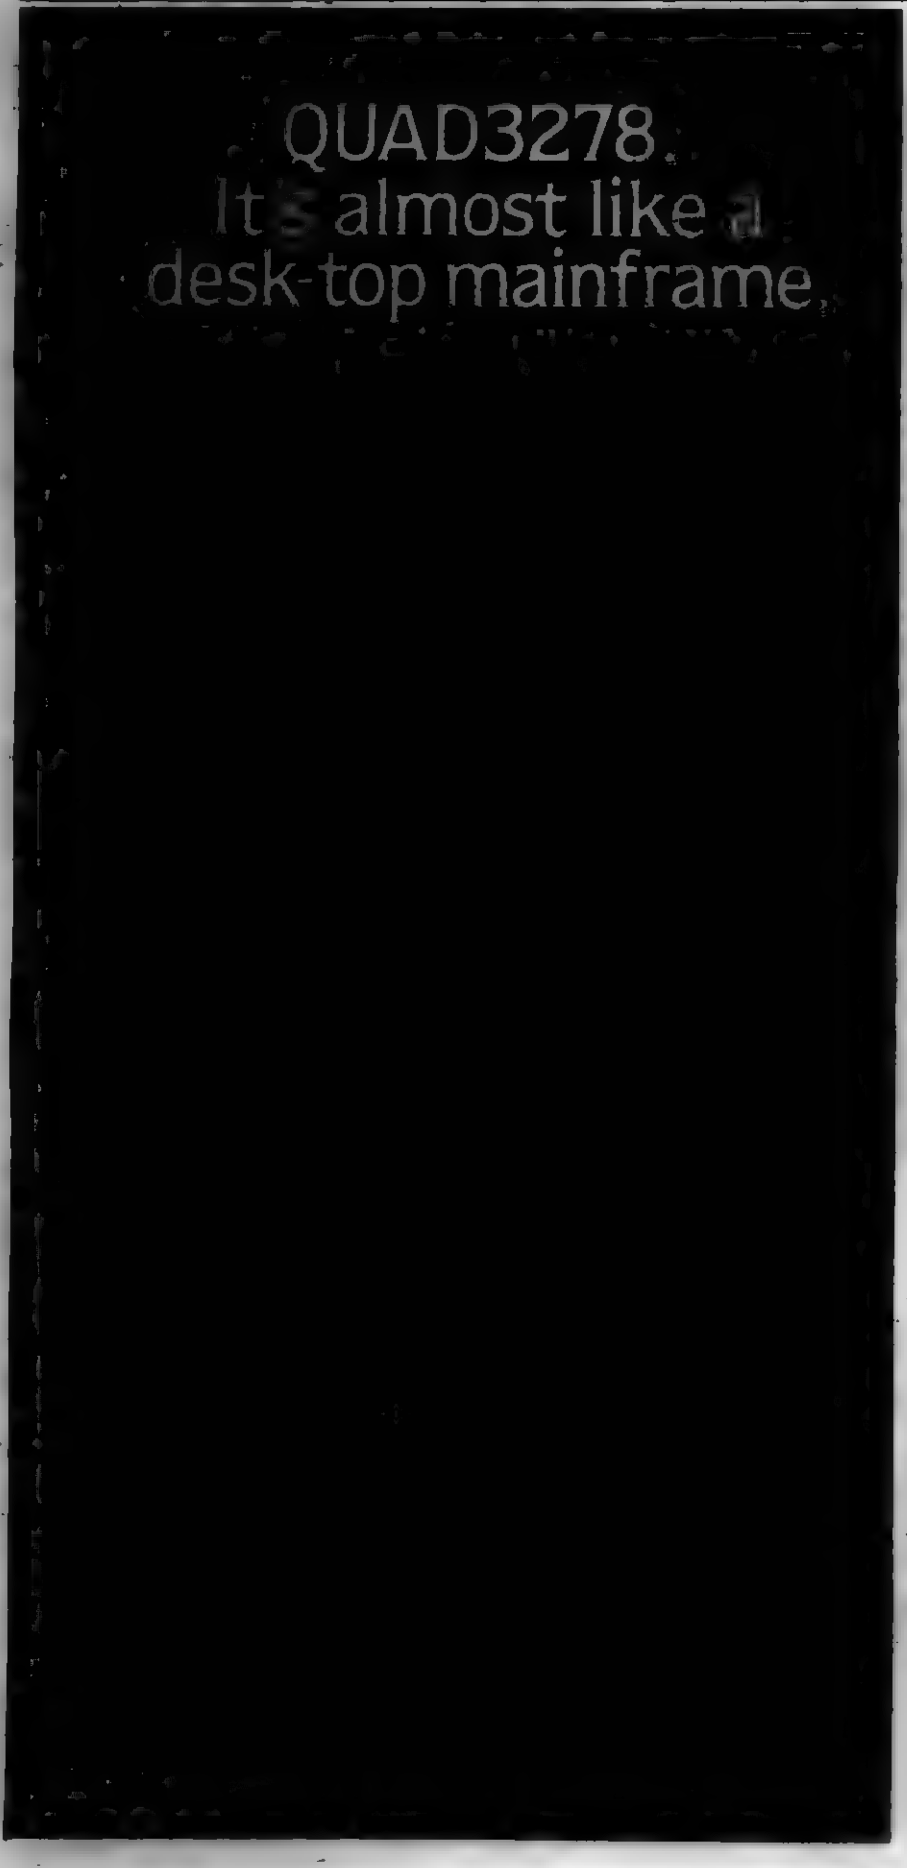
Q Two years ago we were a company of 25 people; today we have over 100 and are growing rapidly. I am the chief financial officer and am also charged with the responsibility for automation. However, we have no computer center and I have very little knowledge of how computers are used outside of accounting and finance. Each division purchases whatever hardware and software they need to do business. As a result, we are decentralized in our use of computers. Fortunately, we have state-of-the-art hardware from a single vendor.

Our vendor has recommended that we purchase a mainframe and centralize the information processing function. Just about everybody has told me that they like it the way it is.

Would you recommend that we move in the direction of centralization or continue as we are?

There is nothing wrong with decentralization as long as someone has control. However, your company may be on a one-way street to embedded, autonomous operations that will be very difficult and costly to integrate at some time in the future. It is important that you begin now to coordinate the growth of your computing resources.

I would recommend a "centralized decentralization" approach. Eventually, if not now, you will want to network your computers while maintaining decentralized operation. Work toward this goal by centralizing control of such things as hardware acquisition, software acquisition and data management, as well as various programming, communications and systems standards.



QUAD3278. It's almost like a desk-top mainframe.

Convert your IBM PC to full 3278 emulation. And back it up with Quadram Quality.

Now you can have all the features of the IBM PC (mass storage and peripherals) plus the incredible power of a mainframe right at your desk. Introducing the new Quad3278 from Quadram. The complete system that makes your IBM PC emulate the 3278 Display Work Station at the touch of a key.

The Quad3278 contains everything you need for converting your PC to total 3278 emulation: hardware, software and full documentation. So you're quickly on-line: where the IBM mainframe sees you as just another 3278 terminal. But thanks to Quadram, you're actually a high-performance, intelligent work station.

And with Quad3278 not only do you retain all the functions of your PC but you can reconfigure your PC keyboard to personal taste. In addition, Quad3278 has its own high-speed microprocessor to keep your PC's microprocessor from being burdened with communications responsibility. And it incorporates the 3279's color mode to give you stunning color displays directly from the mainframe.

Make the connection from micro to mainframe. And back it up with Quadram Quality. Ask for Quad3278. It's the logical step for the future.

MORE THAN 50,000 USERS HAVE PUT IN A PLUG FOR WANGNET.

When it comes to local area networking, Wang has all the business connections your company needs. In fact, Wang has been delivering their LAN system to businesses, both large and small, since 1981.

It's called WangNet. And today it's helping over 50,000 users keep pace with their ever-increasing communications needs.

WangNet ties your business together – today.

WangNet permits the concurrent exchange of text, data, graphics, electronic mail, and video at a rate of up to 10 megabits per second. And it can tie all of your organization's departments together, whether they're in one building or divided among several.

Because WangNet's dual broadband cable is installed much like electrical wiring, adding on new computer equipment is as easy as plugging in a lamp. So whatever networking needs arise, you'll be well prepared to meet them with WangNet.

The architecture is wide open.

Best of all, because WangNet is an open LAN, it allows you to tie most major office systems together. WangNet offers a transparent interconnection for over 300 switched or dedicated telecommunications channels, the IBM 3270 workstation-to-controller transport, and most video applications.

Considering all the information that's inundating today's office, there's no question that local area networking is a technology whose time has come. And with 50,000 people putting in a plug for WangNet already, the question is – isn't it time WangNet came into your business?

Get the facts.

To receive a copy of our latest WangNet brochure, call 1-800-225-9264. Or write to the Wang Business Executive Center, One Industrial Avenue, M/S 5413, Lowell, MA 01851.

CALL FOR PAPERS

1985 CAUSE NATIONAL CONFERENCE
New Orleans, Dec. 10-12, 1985

A call for papers has been issued for this national conference which will address the current state and future of higher education computing from a planning and management perspective through seven professional presentation tracks. They are as follows: Track 1: Policy Issues in Higher Education; Track 2: Planning for Information Technology; Track 3: Special Environments; Track 4: Telecommunications/Networking; Track 5: Microcomputer Issues and Applications; Track 6: People Issues in Information Technology; and Track 7: Managing Academic Computing.

You are invited to send abstracts for papers to be considered for presentation at Cause '85 or to propose a panel of colleagues to discuss the various aspects of any of these topics. The deadline for abstracts is July 15, 1985, and should be sent to Cause, 737 29th St., Boulder, Colo. 80303.

SEVENTH ANNUAL CONFERENCE ON EDP PERFORMANCE MANAGEMENT
Scottsdale, Ariz., March 1986

Papers are now being sought for this conference which will be held in early March. Presentations are requested for but not limited to the following areas: integrating business and information system planning; capacity management approaches; the impact of personal computers and end-user computing on capacity management; information system's role in raising user productivity; organizing for performance management/capacity planning; future trends in information systems/performance management; improving communications with users/management; charging, pricing and cost accounting; workload forecasting for capacity management; distributed data processing and communications management; capacity planning implications of information centers; service levels and service agreements; performance considerations in system design; data base management systems performance issues; productivity in systems development; and scheduling and production control.

Presentations should be management-oriented and approximately 30 minutes in duration. The deadline date is July 15, 1985. For more information on the conference, contact Applied Computer Research, Inc., P.O. Box 9280, Phoenix, Ariz. 85068.

EXPERT SYSTEMS IN CIVIL ENGINEERING
Seattle, April 7-11, 1986

This symposium will be sponsored by the Technical Council on Computer Practices, American Society of Civil Engineers. The three main themes for the symposium are as follows: tutorial on expert systems; application of expert systems to civil engineering; and developments in expert systems in civil engineering.

Prospective authors are encouraged to submit 200-word abstracts to Dr. Celal N. Kostem, Fritz Engineering Laboratory, 13, Lehigh University, Bethlehem, Pa. 18015; or Dr. Mary Lou Maher, Civil Engineering Department, Carnegie-Mellon University, Pittsburgh, Pa. 15213. The deadline for the submission of abstracts is August 1, 1985.

THE OFFICE SYSTEMS RESEARCH ASSOCIATION'S (OSRA) FIFTH ANNUAL RESEARCH CONFERENCE
Houston, March 22-23, 1986

A call for papers has been issued by the conference chairman for this fifth annual conference. The list of suggested topics includes but is not limited to the following areas: planning and conducting effective research projects; data gathering and analysis techniques; office automation case studies; office automation overviews; behavioral and psychological implications of office automation; environmental factors in the automated office; the impact of the microcomputer on office systems; new and emerging OA technologies; career opportunities in OA; collegiate education for the automated office; white-collar productivity; OA implementation strategies; factors involving VDTs; graphics; networking; and on-site vs. off-site office automation.

Papers and proposals should be submitted by August 15, 1985 to Mary K. Ruprecht, Conference Chair, Osra, 140 W. Myrtle St., Duluth, Minn. 55811.

INTERNATIONAL FEDERATION FOR INFORMATION PROCESSING SOCIETIES (IFIPS) '86 : 10TH WORLD COMPUTER CONGRESS
Dublin, Sept. 1-5, 1986

Ifips, the sponsor for this 10th computer congress, has issued a call for papers. The program has been divided into four main streams: design of components, applications, design of systems and informatics in a developing world. Within each of the four main streams there will be specialized subsections such as theoretical computer science, software engineering, distributed systems, artificial intelligence and computer-integrated manufacturing.

Papers are due no later than Sept. 1, 1985. For additional information, please contact David M. Hyatt, Data Decisions, Inc., 20 Brace Road, Cherry Hill, N.J. 08034; or Philip H. Dorn, Dorn Computer Consultants, Inc., 25 E. 86th St., New York, N.Y. 10028.

Kodak announces plain-paper printing: the lowest-cost retrieval you can buy.

Presenting the Kodak IMT-350 microimage terminal and the Kodak Starvue II reader-printer, the first image-management work stations from Kodak with the plus of plain-paper printing. And unmatched retrieval savings.

Both units offer high-speed front delivery of positive prints from either positive or negative film. Under-2¢-a-print economy. Improved work flow. Labor and materials savings. And the means to increase your productivity up to *50%*.

These new, advanced work stations bring operator and operations closer together. All controls are within a 12-inch reach, so there's less time spent getting to the information, more time with it.

Add up all the economies...lower search-and-print costs, reduced labor and materials costs...factor in a level of productivity up to twice that of similar plain-paper retrieval units...and you'll get unbeatable bottom-line retrieval savings.

For high-volume, fully integrated technology interfaced with your computer or the Kodak KAR-4400 or KAR-2200 information system, look into the IMT-350 microimage terminal. For high-speed, semiautomatic printing capability, choose the Starvue II reader-printer. Either way, you're getting maximum output at the lowest cost available today.

Let us prove it to you. Write to us:

THE BIG THREE IN BUSINESS SOFTWARE. BEFORE YOU BUY, SEE HOW THEY RUN.

Run their general ledger. Their payroll/personnel. Their entire product line of financial and human resources software. Run the packages on your mainframe and link them to your PC's. Run them together and see if they work together.

You may well conclude that even though each of the big three has succeeded in business, only one of them has succeeded at integrating business application software.

And if your company size is $100 million in sales or more, this discovery could spare you the pain of much lost time and money over the next few years. Because when you acquire a half dozen systems that fit together in name only—but not in fact—you face six times the training, six times the delay and six times the anxiety.

We believe your evaluation will show you this:

Two companies offer the mere appearance of integration. An agglomeration of business applications linked superficially. Through a web of hinges, patches, bridges, shadow files and masks lurking just below the surface.

While one offers the real thing. Millennium. A true family of systems in which the whole works as smoothly as any part. In which every package has the same query mechanism, the same report writers, the same screen generation, the same on-line documentation, security and real-time capabilities. So that when the packages are put together, there are absolutely no borders between them. They fit like pieces in a jigsaw puzzle. Making the most efficient use of all your data processing resources.

There's even a Millennium application development tool, so you can create new systems as you need them. Without slow, expensive programming.

Millennium means integration in fact. Not just in name. And it is available only from McCormack & Dodge.

Of the big three in software, who's blind to integration and who's not?

When you see how they run, you'll know the answer.

TELEX COMPUTER PRODUCTS, INC.

SOMETIMES YOU NEED MORE
THE QUESTION IS,

THE MINI TOWER

THE TOWER

Maybe you run a small business. A department of a large business. Or a nationwide network of businesses.

No matter what size business you run, one of the NCR Towers™ above can help you run it better.

Because they all give your people a lot more speed, memory, storage and versatility than personal computers. For a lot less money.

MORE THAN A PERSONAL COMPUTER IN MORE WAYS THAN ONE.

The Towers utilize UNIX SYSTEM V* or RM/COS* as their operating system. Which means they're perfect for the sophisticated user who wants to write his own programs, as well as for the beginner who can choose from hundreds of off-the-shelf solutions to his problems.

If your business or department has already invested in IBM or IBM-compatible personal computers (the NCR PC 4, for instance), you can use them as intelligent work stations with any of the Towers.

And, finally, the Towers can all stand alone or be networked together. As well as communicate with other computer systems via SNA, X.25 and other industry standard protocols.

THEY PERFORM BRILLIANTLY BECAUSE THEY'RE BUILT BRILLIANTLY.

The Towers are all powered by Motorola microprocessors (the regular Tower by the 68000, the XP and Mini by multiple 68010's).

Other state-of-the-art features include Winchester hard disk and the Intel Multibus.* Not to mention an error-correcting memory.

© 1985 NCR Corporation

* UNIX SYSTEM V is a registered trademark of Bell Laboratories. Multibus is a registered trademark of Intel Corporation. RM/COS is a registered trademark of Ryan McFarland Co.

THAN A PERSONAL COMPUTER. HOW MUCH MORE?

THE TOWER XP

and a unique power-failure recovery system that enables all the Towers to survive power outages (thus keeping your data intact).

PEOPLE WHO NEED MORE THAN A PERSONAL COMPUTER DON'T ALL HAVE THE SAME NEEDS.

Of course, the Towers do have their differences.

You can choose from 512 kilobytes of memory to eight megabytes. From twenty-five megabytes of disk storage to 260 megabytes. From a system for one to eight users to a system for up to sixteen users. Starting for as little as $6,995.

But no matter which Tower you choose, you'll choose a computer that's a good deal more than a personal computer. And one which is backed by service from 1,200 offices throughout 120 countries.

Which means that in addition to getting all the computer you need, you'll get all the support you need.

For more information on the NCR Towers, dial us toll-free at 1-800-CALL NCR.

NCR

INNOVATIVE COMPUTER TECHNOLOGY. YOU CAN EXPECT IT FROM NCR.

EDITORIAL

Clarion call to a long war

The Association of Data Processing Service Organizations, Inc. has won the first battle in what promises to be a long war against software piracy.

Adapso recently announced an out-of-court cash settlement in which American Brands, Inc. admitted that its subsidiary, Wilson Jones Co., engaged in unauthorized duplication of three software products from Micropro International Corp. — Wordstar, Mailmerge and Spellstar [CW, June 3]. Adapso and Micropro had filed a 20-count complaint against the $7 billion American Brands in January [CW, Jan. 21], seeking $225,000 in damages and the return of any profits earned as a result of the alleged copying.

An Adapso spokesman said Wilson Jones agreed to pay an unspecified cash sum to Micropro and also agreed that "appropriate procedures will be instituted to [ensure] against such improper duplication."

We — and apparently Adapso, too — had expected the suit to travel a long path through the courts. The out-of-court settlement, while anticlimactic, nevertheless dramatizes the serious intent of software vendors to prosecute those who illegally copy software, even though theft occurs without the knowledge or acquiescence of corporate executives, as in the American Brands' case.

Software piracy is big business in this country. Roughly half of all microcomputer data base, spreadsheet and word processing programs in use are illegally copied, according to a study by Future Computing, Inc. [CW, Jan. 21]. Illegal software duplication cost U.S. vendors an estimated $1.3 billion in lost revenues from 1981 to 1984 and is expected to cost them another $800 million this year. The validity of the numbers in this study has been attacked, but the numbers nevertheless give some indication of the magnitude of the problem.

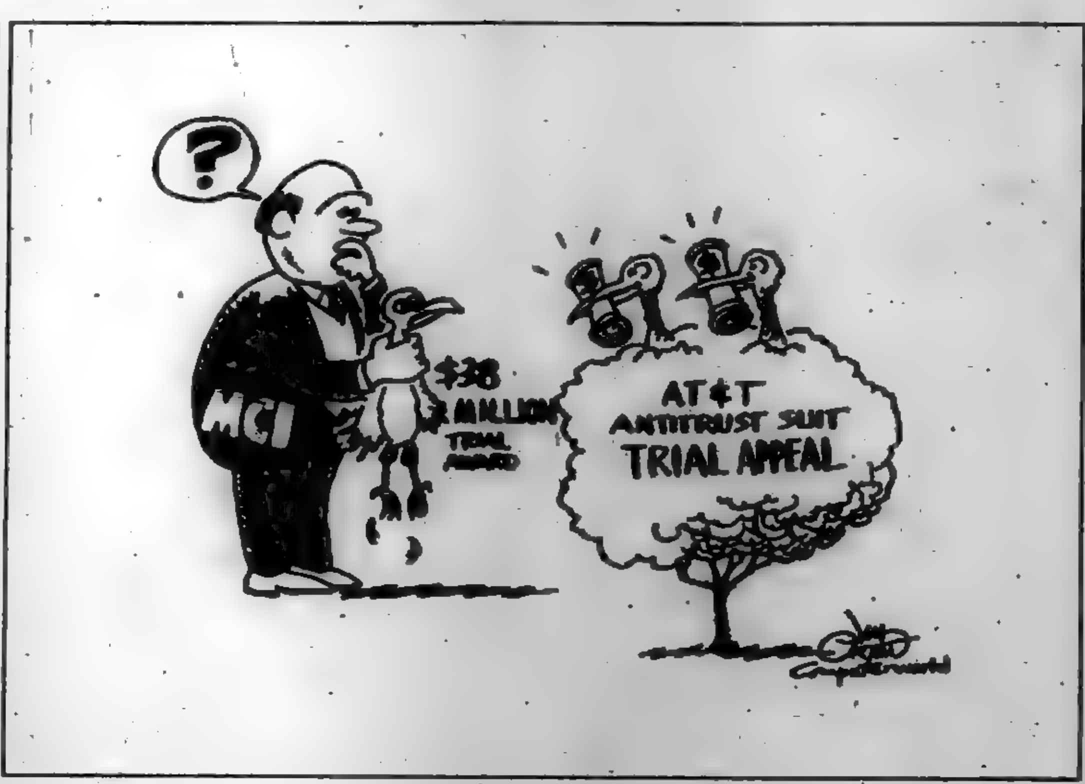
Considering the vast sums at stake and the success of the Adapso filing, we would expect more lawsuits to follow. Not that prosecution is the best way to proceed. Marv Goldschmitt, vice-president for business development at Lotus Development Corp. and chairman of Adapso's Software Authorization Committee, said that a lawsuit is a last resort for preventing piracy and is the least desirable tactic. But that tactic does seem to get the attention of top corporate executives.

Meanwhile, Adapso is also proceeding with an extensive publicity campaign. The association has mailed about 60,000 brochures to chief executive officers and chief legal counsels, detailing liabilities of software piracy and urging establishment of formal antipiracy policies.

The third prong of attack is the association's controversial proposal for a microcomputer software protection key scheme that is now only in draft form but is already meeting resistance from the user community.

Each of these steps may help combat software piracy in the short term. But even the American Brands case has left one question unanswered: Who is ultimately responsible for custody of software? The CEO? The data processing department? The end user? The manufacturer?

We encourage Adapso to continue its antipiracy efforts, whether they be through public relations or legal action. The long war has just begun.



LETTERS

DOD's resources not so abundant

In the column "Credibility gap undermines user confidence" [CW, April 8], the author may know the U.S. Department of Defense "to possess truly unlimited funding for data processing power and all the management and technical brains to go with it," but I didn't see much evidence of it while I was on active duty in the Air Force from 1972 to 1976.

I started my duty working on Sage, a vacuum tube museum piece that managed air defense until 1982. The machine had a 6 million instruction/sec. cycle time. It was rumored that spares were to come from Czechoslovakia, because no free-world company made the tubes.

I moved from Sage to a relatively modern Honeywell, Inc. 200 with a tape-based operating system. The printer was used constantly for up to eight hours a day when it wasn't broken, and it was broken often. In order to replace it with a surplus printer from another site, I had to go through heck. First, I got the Honeywell maintenance manager to refuse further contract maintenance on it. Then, I got the environmental engineers to certify it as a noise hazard. Then, I had to get a price from Honeywell on refurbishing it at the factory. Finally, I got lucky and knew the captain who had to OK the deal at higher headquarters. He took my word for it that the printer had to go. The cost I was justifying was $25/mo in increased maintenance. Honeywell hated the old printer so much that it had offered free installation on anything I could get that was in better condition.

My point is that the computer resources in the military were neglected systematically from the

VIEWPOINT

The heroes, victims of technology's fantasia

LECHT ON SCIENCE
Charles P. Lecht

This column is dedicated to the growing legion of information systems managers. To those of them still with us, I offer a hymn of praise to their survival capabilities. To those who have given up the ghost in their struggle to keep afloat in the technological flood of the '80s, this is a requiem.

Today's information systems manager may be forgiven if he is found treading water or even swimming against the current in the mighty river of technology that is gushing into corporate facilities. Managing its effective application and looking like you know what you're doing is no easy job. The increased arrival speed of cost-effective innovations is shortening the time periods that may be covered by plans so much that information systems managers seem myopic to their superiors.

As the definition of "long range" condenses from five years to three, two or even one year and the definition of "short range" does so commensurately, the number of disruptions in information systems production rise. Many top managers don't consider that the net effect of each disruption and the cumulative net effect is diminishing on an annual basis.

The old system conversion process was a traumatic event and frequently involved tossing the manager out with the replaced system, as if this would lessen the trauma.

Times have changed. Any shortsightedness around these days is likely to be found upstairs. Most corporate officers act surprised when they are informed that conversion to a new system is required and that production will decrease as a result. In the past, the officers could defer both by sending the manager who asked for the conversion on a quest from which many hoped he'd never return. Today, many have found that deferment may be dangerous to their corporations' health and to their benefits and are thinking twice about sending anyone on such a quest for too long.

Two questions to be answered

The quest involved a fact-finding mission to help corporate management decide whether or not the manager's request was to be honored. The subsequent report was always boiled down to answering two key questions: The first was whether a date could be predicted when the preconversion production levels could be surpassed; the second related to whether the newly installed system would last long enough to obtain a profit. Answering either question was predicated upon a marketplace that, in some way, was synchronized with production and where little surprise could be expected from the competition.

Today's corporate management demands that conversions to new computer and communications facilities be justified by classic return on investment criteria, and this can impede the corporate information systems department enough to render it useless.

The pace at which new and cost-justifiable hardware has entered the user marketplace verifies this conclusion. Consider the IBM Personal Computer line: The speed with which IBM's Personal Computer AT followed the Personal Computer and Personal Computer XT was dazzling.

Most corporate officers are used to receiving a plan that answers the two questions I mentioned, but they are truly unable to understand why it's getting harder and harder for the information systems manager to provide those answers. In the time it may take to gather this information, a generation of hardware improvements may have been missed. There are those who call for a slowing of the pace of hardware introductions to remedy this, but any purposeful retardation of technological innovation is unthinkable these days.

Predictions become dicey

It doesn't take too much imagination to see that predictability in the creation of corporate information systems plans must suffer in today's fast-moving scene. It takes so long to create such plans in some corporations that, once the plans are approved, the manager attempting to do so appears more of a historian than a planner. It is unfortunate that predictability is being eroded by change just when management practice in the appraisal of employee performance is so stagnant. It makes any sort of risky prediction dangerous to the planner's career.

Our industry has never been known for its predictability. Even in the best of times, creating plans and asserting their lasting quality has always been considered adventurous if not dangerous. Making predictions today — especially those labeled as long range — is, no doubt, riskier than ever.

Perhaps the only thing predictable today is that managers who create such plans will have to defend them by facing the fire of corporate politics. Many of those who do will be sent to a firing squad of incompetent corporate politicians. If retirement benefits are at stake, the politicians will be accompanied by their watchdog lawyers to ensure that their victims die of poverty, whether or not they deserve it.

We can only offer our prayers to the brave manager who still believes in corporate heroism and still attempts to create long-range plans while swimming in a technological flood. And we praise him if he finds himself labeled as more than stupid. And if his reward is to be labeled as nothing more than a janitorial Mickey Mouse, unable to comprehend today's fantasia of sweeping change, we say better luck next time.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Advanced DP training requires attitude adjustment

HUMAN CONNECTION
Jack Stone

A short while ago, I had the dubious pleasure of conducting a hands-on training class in "advanced" data processing systems for a contingent of office administrators employed by a large organization. The prerequisites for entry included formal class work in word processing on the same equipment, plus a minimum of six months hands-on experience in word processing applications.

Unfortunately, the entry requirements were not nearly stringent enough — but not in areas that I had anticipated. What my group members needed was some attitudinal realignment before they were allowed to attend the session.

All of the attendees were indeed knowledgeable of the basic WP functions: create, edit, print and others. But the members of the group were woefully short of the capabilities that fell in the general realm of "advanced" functions — those skills necessary for effective use of the data processing system — even though most of them had used the equipment for more than two years.

> ”
>
> *Is allocating some of your personal time to your employer's computer training endeavor too great a sacrifice?*

In a way as tactful as possible, I asked the class its views on why there exists a lack of knowledge of the advanced functions. Our dialogue on the subject went something like the following:

Class: "Our organization is responsible for providing users with the training necessary to perform on the job. Management arranges for basic training both on the premises and with outside vendors, but we nevertheless need classes in many of the advanced topics. Without such classes, we are unable to learn how to use the equipment in these areas."

Class leader: "I don't believe you're giving yourselves enough credit for your intellectual ability. After all, the hardest part of word processing is to develop typing skills. Thereafter, the functionality is virtually all automatic. Naturally, you must learn what buttons to push to achieve processing objectives and extend your thinking a tad beyond conventional word processing, but is this all beyond your learning disciplines?"

Class: "Of course not, but we are not given time off to pursue training on our own. We are completely occupied by the day-to-day pressures, and any lull in the workload is used for breathing purposes and not for learning new computer bells and whistles."

Class leader: "What is the difference between your working environment and those environments elsewhere? Office workers everywhere have their shoulders to the grindstone and are being directed to turn out more product in less time with fewer compensations.

"There is an alternative way to handle training. Perhaps it is an anathema in today's office world, but there is the concept of investing your own time, outside of business hours, to learn new features and capabilities of the machinery. After all, there are vast numbers of office professionals to be trained in a wide range of information-handling subjects, and the needs are certainly ongoing as systems are updated. Surely, one's employer cannot be expected to foot the entire bill for computer training, particularly because the individual benefits from the experience beyond the confines of the current job. Doesn't it make sense for the employees to share in this responsibility and commit some of their own time to the process?"

Class: "But you don't understand. We put in a very long day, and we are exhausted by the time we drag ourselves through the front door at night. This is hardly conducive to sitting in front of a terminal and/or reading high-tech literature. Furthermore, we want to spend more time with our families and less time worrying about the job. Finally, most of us are in car pools and it would be very inconvenient to stay late in the office."

Class leader: "I fully recognize the difficulties and problems associ-

LETTERS

Take a look at the market

I would like to respond to several points Adam Osborne made in his letter "Pundits' analyses refuted" [CW, May 13].

First, I made no attempt to "tell the world inaccurately what [Osborne is] doing." I merely stated my view of the software marketplace, which happens to differ markedly from his.

Second, I stand by the statements I made in the article to which Osborne referred [CW, March 18]. There may exist a small segment of potential word processing software purchasers who are willing to accept limited functions based on a six-year-old technology. However, Infocorp's studies show a significantly larger segment of word processing buyers are willing to pay for advanced functions.

Osborne should know from painful past experience what happens to a computer company that attempts to foist products based on outdated hardware technology on an increasingly sophisticated buying public: The public buys the new technology.

The same is true for software. Document processing software that features scanned input of both text and images, electronic mailing to noncompatible word processors, combined text and graphics editing, built-in arithmetic, laser printer support with a wide variety of fonts, form-letter generation facilities and built-in spelling and grammar correction will be commonplace within a year. When Osborne's company ships a fully tested, well-documented, bug-free software package with all of these features for less than $100, I will be the first in line to buy a copy.

Robert M. Lefkowits
Cupertino, Calif.

Good luck with personnel

I feel so sorry for David Dorbandt from the description in the article "Out of work at 46, manager sets DP skills on new course" [CW, May 6]. He, of course, has the right attitude and a positive outlook.

However, no one has the slightest interest in his theory that his experience is transferable and that he is a highly skilled, well-trained manager of high-technology computer projects.

Most of his time and effort will be directed at communicating with the world's greatest ignoramuses: personnel departments.

These infamous (and justly so) dunderheads will have absolutely no idea what Dorbandt is talking about nor will they care. Their only interest will be in filling a job order to the letter. Dorbandt will never speak with a technically oriented person with the authority to hire him unless a minor miracle occurs.

Again, I wish him great luck in his search, but he is better off if he agrees to take half his last salary and learn how to type and shuffle a lot.

L. A. Brown
New York

Computerworld welcomes letters from its readers. Preference will be given to typed, double-spaced letters of 150 words or fewer. Letters may be edited for the purposes of clarity and brevity. Letters should be addressed to Editor, Computerworld, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

CLASS from page 41

ated with self training on an after-hours basis. On the other hand, the reality of the situation is simply that most organizations do not have the resources to conduct lengthy training programs and that most future needs will have to be met from your own initiatives. Nearly all employers will provide access to machines, textbooks and ancillary self-training materials at no cost to the employees, which is certainly a major contribution. Is allocating some of your personal time to the endeavor too great a sacrifice?

"You will surely benefit from your labors since the added knowledge will hardly hinder your work productivity or professional development. As a final note, the success of many computer professionals owes, in part, to endless days and weeks of home study, which is considered an essential part of the job." ‡

LETTER from page 40

start of the war in Viet Nam until roughly 1960. The lower level people, from company grade down, struggled mightily to keep the junk running. The field-grade officers (majors and above) were mostly former pilots and radar surveillance types who didn't realize how bad the situation was or tried to keep a stiff upper lip in the face of disaster. Congress would fund only weapons procurement and not too much of that after 1972.

The procurement systems that everyone complains about now were definitely among the systems neglected. Until recently they were based on punched cards.

The lessons to be learned from the current DOD credibility problems are relevant to the costs associated with postponing system modernization in order to save on current expenses. In the long run you get creamed because your systems fail to provide needed information.

MIS managers faced with such cuts should make sure they explain the risks to senior management and get the heavy hitters to take the responsibility, preferably in writing. MIS managers who fail to make clear the long-term costs of delayed modernization will experience the "credibility gap" that the DOD has now.

Douglas Baker
Wilmette, Ill.

IT'S ABOUT TIME!

THAT SOMEONE FINALLY DESIGNED A DATA COMMUNICATION SYSTEM THAT PROVIDES AN ALTERNATIVE TO HIGH PRICED, HARD TO GET LEASED LINES...

IT'S ABOUT TIME AND MONEY YOU SAVE by getting on line immediately with DIALMUX, the new 5 channel switching multiplexer which uses the regular dial-up telephone network.

With the DIALMUX, once an automatic dial-up connection is established, up to five users can simultaneously communicate and share the same 2400 baud data connection. Since the telephone line charges are based on the duration of the connection, in essence, five calls can be made for the price of one.

Channel Switching Multiplexer

Features include:
- Channel Switching
- Error control & retransmission
- Automatic data-link recovery
- Port access call-back security
- Programmable port parameters
- Host site access may be shared by multiple locations
- On-line system diagnostics.

Backus
DATA SYSTEMS, INC.
A subsidiary of Astronautics Corporation of America

To receive more information about the DialMux, LineMux or DialSafe Security products, contact your local distributor or call collect (408) 279-8711.

To Be Successful In Information Management, You Need More Than Just The Right Connections.

Connectivity. The buzzword of the year. Everybody's talking compatibility, multi-user interfaces, and integrated applications.

Well, excuse us, but it's about time. Datapoint has been delivering integrated information processing and office automation systems for more than 15 years. You see, we discovered a long time ago that people really gain productivity when computing power is distributed. Because the real power of business computers is access to information—wherever it is, whenever you need it.

It's more than a matter of stringing cable. The goal is deceptively simple. You and your people need desktop access to the information and the software and hardware tools you use to do your job. Even more important than choosing the right connections is how you use those connections. Managing information flow. Controlling data access. Allocating shared resources. Integrating applications. These are the tasks that will determine the success of your information management system.

And here's where Datapoint comes in. Take our Resource Management System.® The heart of the Datapoint® ARC® local area network. In fact, the Resource Management System is the first operating system designed specifically to take advantage of the power of local area networking. And it's at least a generation ahead of all the others.

Powerful Resource Management. Powerful enough to integrate the most complicated data processing applications with the most commonly used office automation tools. Of course, all this sophistication is totally transparent to your users. From any desktop workstation, they simply select the tools they need to make them more productive. Even if that workstation happens to be an IBM®-PC.

Flexible Resource Management. You can add, shift or remove workstations, peripherals, and software applications without bringing the rest of the system down. Without reprogramming. And, most importantly, without affecting your users' productivity.

The right connections—and more. From our pioneering efforts in distributed data processing to the world's leading local area network, the secret to the Datapoint success story is this unique combination of technological innovation with a singular focus on business productivity. If you're looking for the right connections in information processing—and more—call us toll free at 1-800-334-1122.

INTRODUCING

THE NEXT STEP FORWARD — A UNIQU

Recently, AT&T Information Systems introduced a product destined to set a new standard for business computers.

Its name: the AT&T UNIX PC Model 7300.

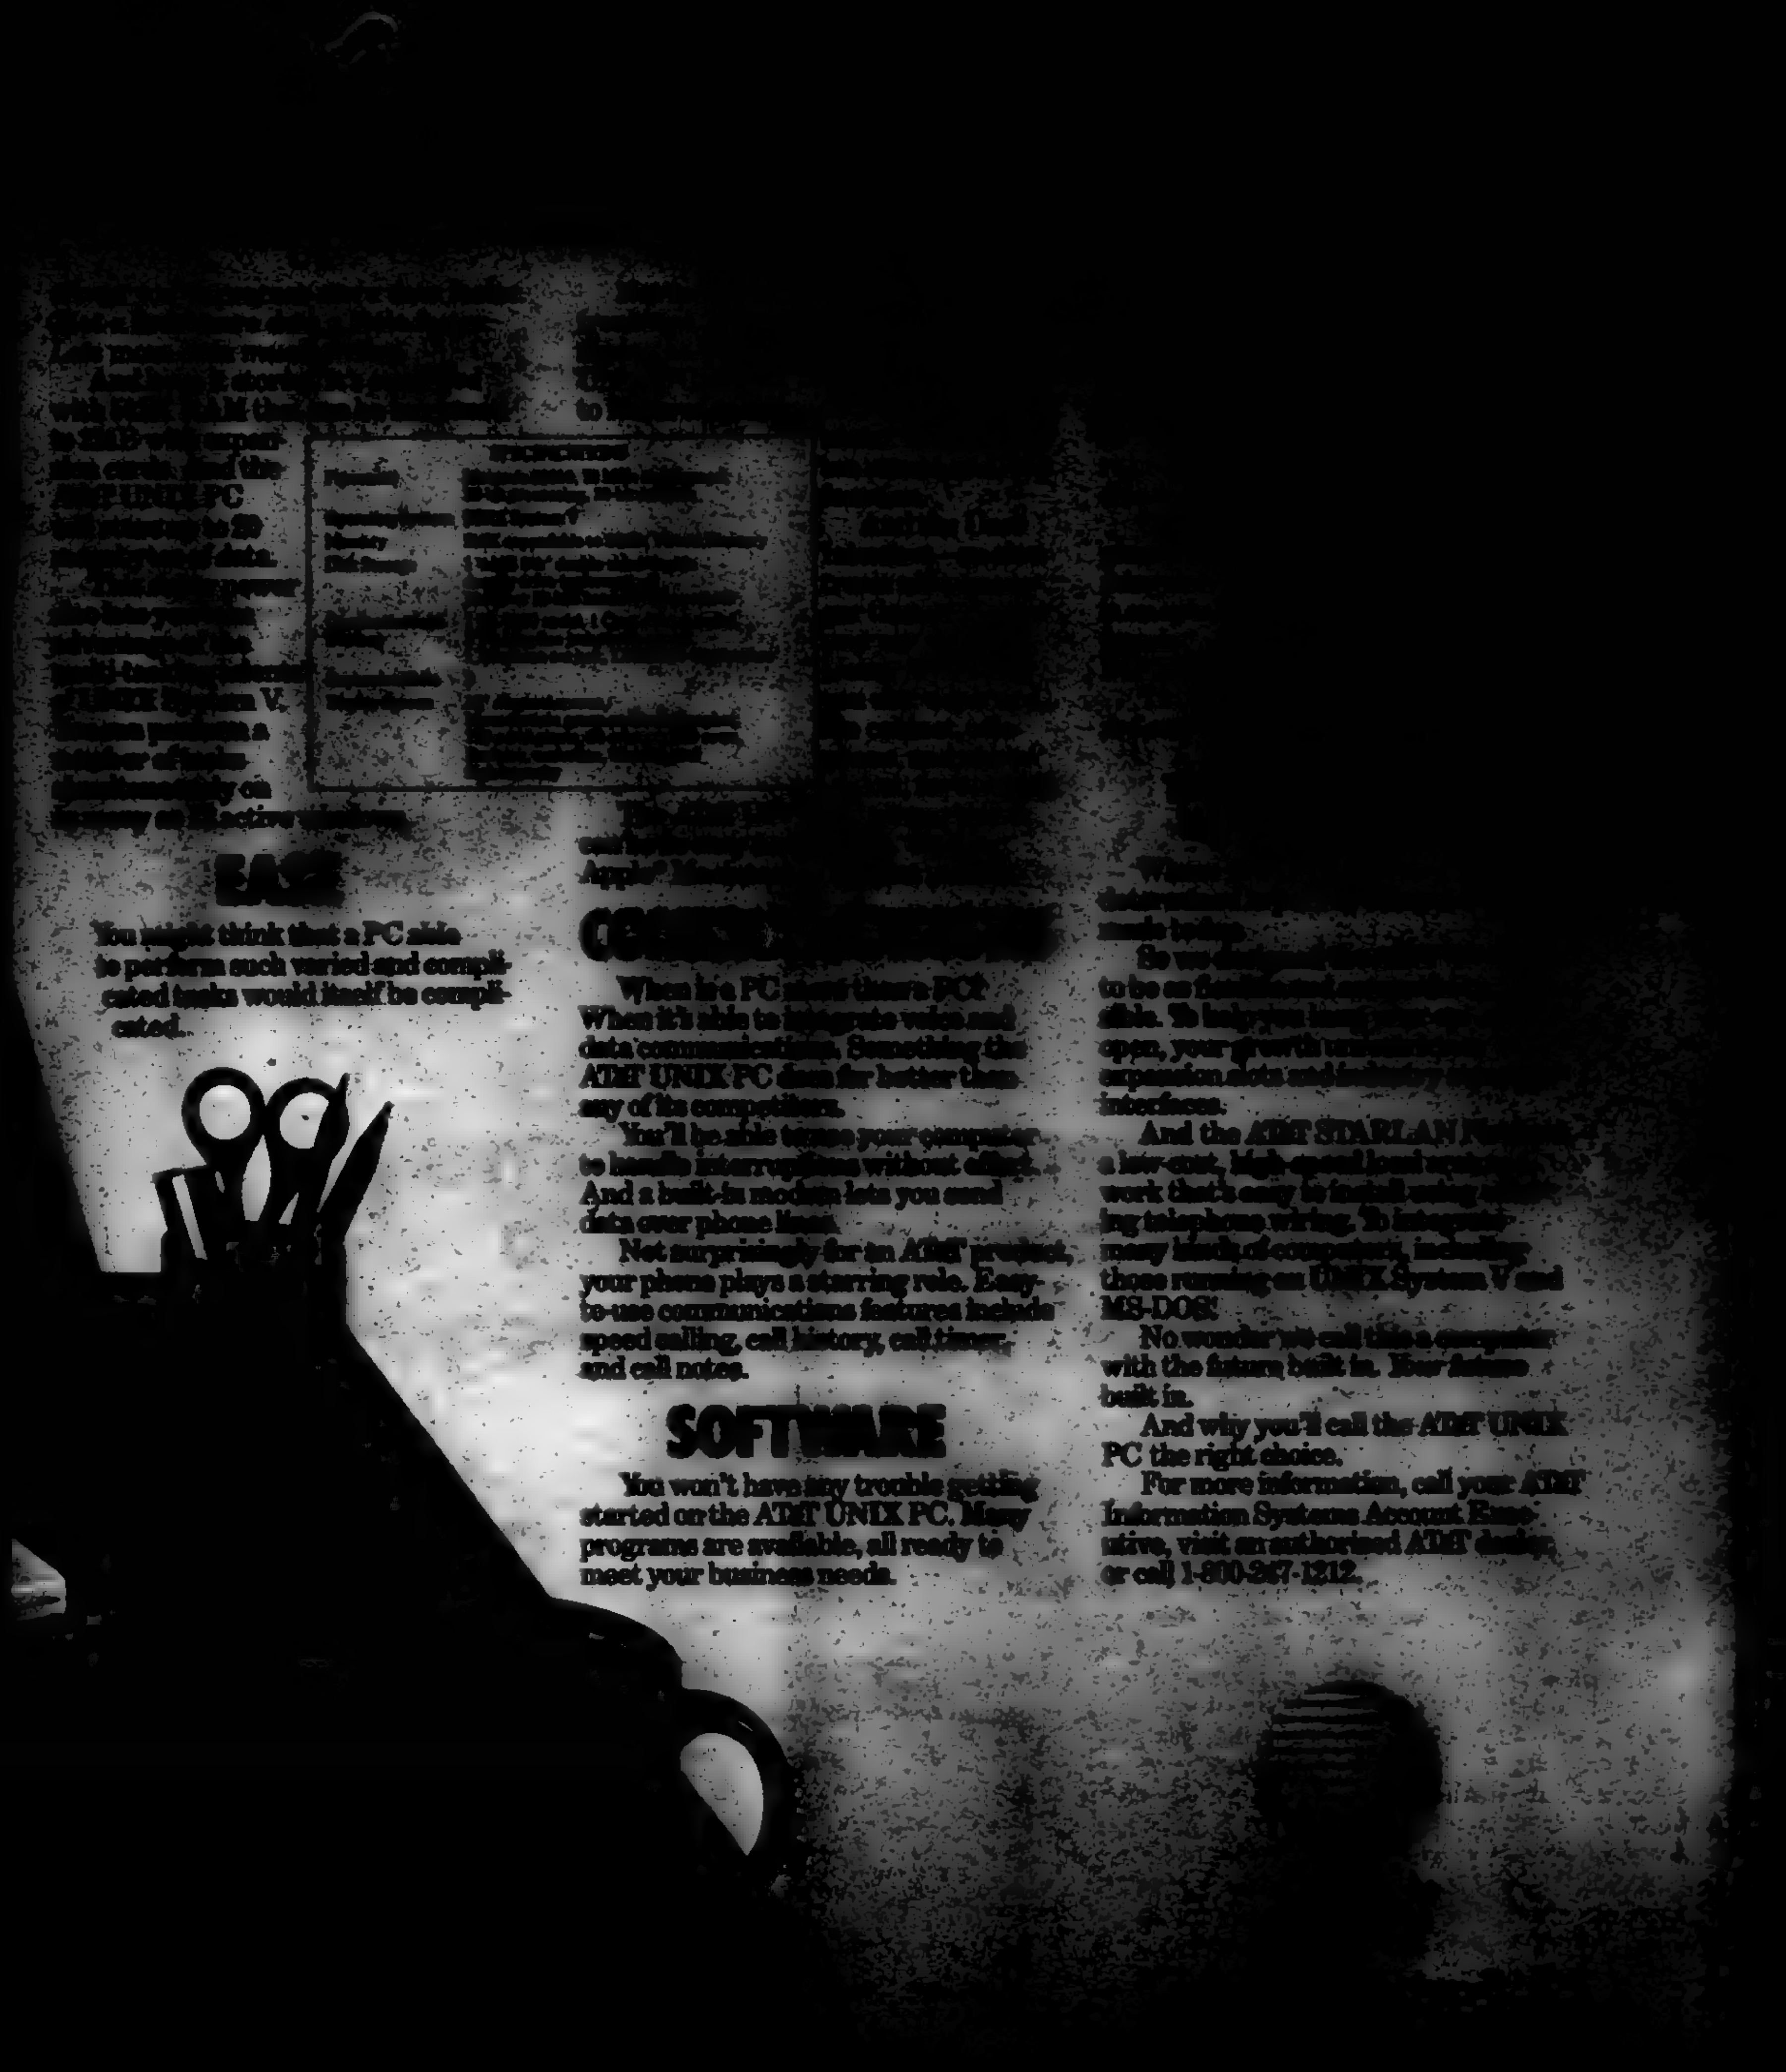
What places this PC so far out in front? Extraordinary power *and* exceptional ease of use *and* unsurpassed communications capabilities *and* maximum flexibility.

The operative word is "and." No other PC offers so much at once. No other PC offers this high-performance combination.

No other PC even comes close.

POWER

UNIX System V is the key to the power of the AT&T UNIX PC. It



[illegible]

And [illegible] with [illegible] RAM [illegible] to 2MB with expansion cards. And the AT&T UNIX PC [illegible] to 20 [illegible] of data.

[illegible] also lets you take advantage of the multi-tasking [illegible] of UNIX System V. [illegible] a number of tasks simultaneously on as many as 12 active windows.

SPECIFICATIONS

[illegible]

[illegible] to [illegible]

And the [illegible]

[illegible]

The AT&T [illegible] Apple® Macintosh [illegible]

EASE

You might think that a PC able to perform such varied and complicated tasks would itself be complicated.

COMMUNICATIONS

When is a PC more than a PC? When it's able to integrate voice and data communications. Something the AT&T UNIX PC does far better than any of its competitors.

You'll be able to use your computer to handle interruptions without effort. And a built-in modem lets you send data over phone lines.

Not surprisingly for an AT&T product, your phone plays a starring role. Easy-to-use communications features include speed calling, call history, call timer, and call notes.

SOFTWARE

You won't have any trouble getting started on the AT&T UNIX PC. Many programs are available, all ready to meet your business needs.

When [illegible] data [illegible] made today.

So we designed [illegible] to be as flexible [illegible] sible. To help you keep [illegible] open, your growth [illegible] expansion slots and industry [illegible] interfaces.

And the AT&T STARLAN N[illegible] a low-cost, high-speed local [illegible] work that's easy to install using [illegible] ing telephone wiring. To integrate many kinds of computers, including those running on UNIX System V and MS-DOS.*

No wonder we call this a computer with the future built in. Your future built in.

And why you'll call the AT&T UNIX PC the right choice.

For more information, call your AT&T Information Systems Account Executive, visit an authorized AT&T dealer, or call 1-800-247-1212.

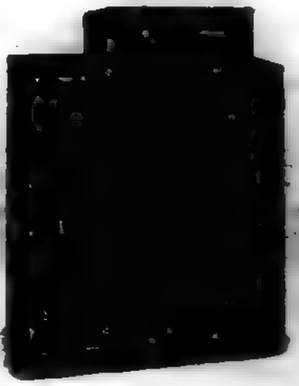
Thin-film head assembly no. 100,001.

An event that confirms our commitment to advanced disk technologies.

Once upon a time, disk ferrite heads were standard issue. So were disk drive products that couldn't be upgraded. What you had was what you had—forever. Ferrite head technology is still around but it's limiting. Using ferrite heads, the way to increase disk capacity is to add more heads and more platters. Adding more heads and platters also means more things to go wrong and costs will go up.

Advances in disk technology are contingent upon getting the bits closer together on the same platter so available space on the disk is more fully utilized. At Storage Technology we anticipated the future. Three years ago we moved up to thin-film head technology, and established a base from which we could expand our family of 8380 disk drive products. With four heads in each assembly, our base now includes more than 400,000 individual thin-film heads. No other independent supplier can make this claim.

It takes good technology to make good products.



Thin-film head assemblies allow us to increase track density beyond the 1000-tracks-per-inch barrier. We put the tracks closer together to increase data capacity and reduce the cost per megabyte of data storage. Thin-film heads are standard issue at Storage Technology. This technology is the foundation of our 8380 family of disk drives.

If you already have our 8380s, you made a better investment than you thought because our 8380s have used thin-film heads from the beginning. And, our 8380s are field upgradeable to the latest family enhancement, the dual-capacity 8380E.

We're manufacturing head disk assemblies; we're using them in our products; we're committed to disk technology—yesterday, today and tomorrow.

Storage Technology Corporation, 2270 South

Dual data base: the right step?

One of the major issues facing many DP shops today is the dual-data base dilemma. To have dual data bases or not to have them; that is the question.

The dilemma stems from the belief that shops should have one data base management system for operational processing and another for decision support or information center-type processing. Some vendors loudly proclaim that the single data base approach is the best solution, while

DSS buyer — Know thyself

By [illegible]
CW Staff

WASHINGTON, D.C. — Selecting the right decision support system (DSS) means knowing first how decisions are made within your company.

At a recent Digital Consulting Associates, Inc. seminar here on DSS, the instructor, John Wark, director of systems software for Walker Interactive Products, Inc., advised managers to examine carefully the way users communicate data before they establish the criteria to be used in selecting a DSS package. If managers are currently exchanging hard-copy graphs and financial spreadsheets, for example, those capabilities should be emphasized in the DSS, he said.

And, to be most effective, a DSS pack-

Oracle announces portable version of IBM SQL/DS and DB2

Any application written for IBM's SQL/DS or DB2 relational database management systems will now run without modification on DEC, DG, AT&T, HP and several other manufacturers' minis, and a wide range of micros, including the IBM PC/XT and PC/AT.

Oracle Corporation introduced the first relational DBMS in 1979. Today ORACLE is the only relational database management system that is completely compatible with IBM's SQL/DS and DB2.. Programs written for SQL/DS or DB2 will run unmodified on ORACLE.

Originally designed for IBM mainframes and DEC superminis, ORACLE is now available on a wide range of machines, from mainframes to PCs. And ORACLE includes an integrated set of 4th generation software tools not available with either SQL/DS or DB2.

■ **Why not Cullinet, ADR or Focus?** There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. Both ANSI and the US Government are in the process of adopting SQL as *the* standard database language. The Cullinet, ADR and FOCUS software packages each implement their own unique database language - each one painting the user into its own corner. Since its inception, Oracle Corporation has provided total IBM SQL compatibility.

Few shops nowadays run only IBM mainframes. Why, then, even consider a database solution that runs *only on IBM mainframes?* Applications written with ORACLE run identically on mainframes, minis, and PCs. Because all versions of ORACLE *are* identical.

FOCUS, Cullinet and ADR offer either a limited subset, a completely different product or nothing at all (respectively) for the PC. And none have minicomputer products.

■ **Why not just go with DB2 or SQL/DS?** A relational DBMS simplifies but does not by itself eliminate application programming. Additional tools are necessary if users are to create and maintain their own applications.

DB2 and SQL/DS are relational systems, period. ORACLE is a relational DBMS plus integrated 4th generation software tools for application generation, report writing, color graphics and network communications.

Furthermore, SQL/DS and DB2 run only on IBM mainframes (and are somewhat unlikely ever to run on another vendor's system). ORACLE runs on more IBM hardware and operating systems than do IBM's relational products.

■ **What about Goldengate, dBase III, Symphony or Framework?** PCs need more than PC software if they are to be usefully integrated with corporate data processing. Incompatibility with SQL, while serious, is not the only major problem with these micro packages. None provides an acceptable level of data security, integrity or recovery facilities. And their PC-to-mainframe links are functionally primitive and difficult to use.

To effectively link computers, all machines in the network should run the same software. Only ORACLE provides standard software on mainframes, minis and micros. Data and programs can then be shared among users of different machines, distributing the workload.

ORACLE is currently installed on over 1000 mainframe and supermini systems around the world, as well as on thousands of PCs. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and government agencies.

For further information, contact Oracle Corp., Dept. C2, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350 ext. 1060.

Prime unveils facilities management aid

NATICK, Mass. — Prime Computer, Inc. has introduced facilities management software for its line of superminicomputers running the Primos operating system.

Facilities Management+ (FM+) was developed by Micro-Vector, Inc. and consists of five integrated modules in the following three products: FM+ Planning, FM+ Tracking and FM+ Leasing.

The product is based on Prime's Information data base management system and can be used alone or in conjunction with the architectural design module of Prime's Medusa software, according to a Prime spokesman.

FM+ Planning consists of a Space Projection module that reportedly allows users to evaluate the effects of an organization's growth. Managers can query the data base by organizational level, office type or personnel code and then modify space accommodation plans.

A Vertical Stacking module is said to help users determine the placement of groups by floor or building.

FM+ Tracking includes an Equipment Management module that maintains an inventory of furniture and equipment, the vendor said. A Project Budget module provides billing information for contractors involved in a renovation project, according to Prime.

FM+ Leasing aids in the management of property leases, allowing users to maintain information on maintenance costs, parking availability and security levels.

FM+ facilitates report generation and data base searches. All modules are integrated, permitting data sharing between products.

FM+ Planning ranges from $14,000 to $19,000 in price; FM+ Tracking ranges from $8,000 to $12,000; and FM+ Leasing costs between $8,000 and $12,000, Prime said.

The products will be available in August.

For further information, Prime is located at Prime Park in Natick, Mass. 01760.

It's just your speed. On just your budget.

The quiet-looking printer above will win applause from your Accounting department, because it can turn out fanfolds by the carload. Flip a switch and its letter-quality mode can spiff up Sales, on your stateliest stationery.

It's Texas Instruments' Model 865 dual-mode printer.

And if you're the one who must make ends meet, it'll make you look good indeed.

Because you can rent or lease it from Leasametric.

Leasametric, you see, has one of the broadest inventories of quality DP equipment anywhere. In addition to the TI Model 865 and its easy-to-change type fonts, you can get PCs, terminals, modems, multiplexers and protocol convertors.

Plus service that you just can't buy. Immediate delivery. Equipment that's fully tested and ready to work for you, complete with manuals, cables and other accessories. A toll-free number to call for on-line diagnostics. On-site maintenance if it's needed. And just in case something doesn't work as it should, immediate replacement.

With financing just as you like it. In addition to standard rental agreements, we offer volume pricing, rentals with options to buy, leasing and even used-equipment sales.

So when you need a printer that's just your type, just in time, or just the best — just give us a call: Leasametric.

Harris offers project tool for supermini

FORT LAUDERDALE, Fla. — Harris Corp. has announced the Project Planning and Management System (PPMS) for planning and management of projects in a range of engineering and construction applications. The package runs on Harris superminicomputers.

The menu-driven PPMS allows project and line managers to evaluate plans, optimize plan execution, maintain project schedules, facilitate communication between departments and staff, estimate costs and control budgets and plan and manage resources, according to a vendor spokesman.

PPMS includes a report writer and color graphics formats for project data presentations.

Multiple project data can be stored with PPMS to serve as many concurrent users as the host Harris system allows.

The number of users able to be accommodated ranges from 32 users on a Harris 60 to 200 users on a Harris 1000.

The PPMS software system costs $90,000 with a $900 monthly maintenance fee.

Harris is located at 2101 W. Cypress Creek Road, Fort Lauderdale, Fla. 33309.

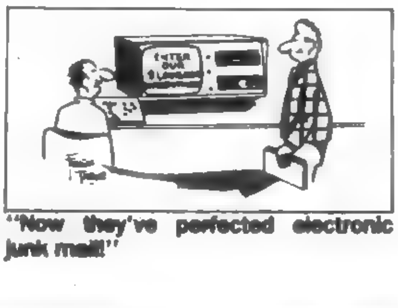
CCA, CAI plan to make module

CAMBRIDGE, Mass. — Computer Corporation of America (CCA) has entered into an agreement with Computer Associates International, Inc. (CAI) to develop an integration module for CCA's Model 204 data base management system and CAI's Financial Management and Distribution Management software for IBM's OS, DOS and VM/CMS operating systems.

The integration will allow the applications from CAI's Advanced Business Software line to access Model 204 files directly, rather than going through IBM Vsam files, a spokesman said. CAI's Advanced Business Software is a series of integrated applications including order processing, inventory control, sales analysis, purchasing, general ledger, accounts payable, accounts receivable and asset management.

The Model 204 integration module will be available in September and will cost $250,000.

CCA is located at Four Cambridge Center, Cambridge, Mass. 02142.



"Now they've perfected electronic junk mail!"

SYSTEMS SOFTWARE

■ **Compuware Corp. has announced Debug-Aid, an interactive test and debugging facility for IBM CICS under IBM's DOS and OS operating systems.**

Debug-Aid includes three levels of transactions: a Debug level incorporating Help screens for inexperienced programmers debugging Cobol programs; a second level for Cobol and assembler programs that allows programmers to browse CICS tables and areas and permits screens to be viewed at remote locations; and Sbug, which allows systems programmers to browse and modify CICS tables and areas and perform analysis on "hung tasks."

Debug-Aid is priced from $9,000 to $17,000, depending on configuration.

Compuware, 32100 Telegraph Road, Birmingham, Mich. 48010.

■ **Verdix Corp. has announced that its Verdix Ada Development System (Vads) is now available for Sun Microsystems, Inc. Sun-2 workstations.**

Vads is a development system that consists of the company's U.S. Department of Defense-validated Ada compiler and a set of software development tools that includes an interactive, screen-oriented symbolic debugger, library management tools and runtime system.

Vads is also available for Digital Equipment Corp.'s VAX series running Unix BSD 4.2 and the DEC Ultrix operating systems.

The cost of Vads on the Sun workstation is $7,500.

Verdix, 7655 Old Springhouse Road, McLean, Va. 22102.

■ **Tower Systems International has announced that its Epic/VSE data set management system is now compatible with IBM's VSE SP2.1 operating system.**

Epic/VSE allows companies to manage, secure and report on tape and disk data set resources, the vendor said. It includes an on-line display and maintenance capabilities for IBM Vsam catalogs. It can allocate disk space and provide disk and tape work data sets for intermediate data storage.

Epic/VSE for IBM's VSE/SP2.1 leases for $325 per month.

Tower Systems International, Suite 365, 19782 MacArthur Blvd., Irvine, Calif. 92715.

■ **SKK, Inc. has announced Multipak/VM, a productivity tool for the IBM VM operating system.**

Multipak/VM consists of a Spool Viewer facility that allows users to display spool files on an IBM CMS-based terminal. The utility displays print and punch files. File attributes can be changed by keying over selected fields.

A Short Cut utility is said to simplify CMS use by guiding users through a multilevel system of command panels. The Screen Painter facility enables users to build full screen application panels by laying out screens as they are to appear. Stretch Edit allows data sets from IBM's MVS or OS/VS1 to be copied onto CMS files without losing the line that is displayed.

Multipak/VM costs $8,000.

SKK, 10400 W. Higgins Road, Rosemont, Ill. 60018.

■ **Intrak, Inc. has introduced Fastneat, a compiler for NCR Corp. V series mainframes under the VRX operating system.**

Fastneat is an enhanced version of NCR's Neat/3 compiler, which was acquired by Intrak. It reportedly operates 30% to 60% faster than Neat/3 and is compatible with NCR's Expanded Disk Addressing disks. The product is both source and object code-compatible with the NCR compiler.

Fastneat costs $4,000, according to the vendor.

Intrak, 6841 Convoy Court, San Diego, Calif. 92111.

■ **Goal Systems International, Inc. has announced FAQS/XP Version 6, featuring additional reports, extended support for IBM 3179 and 3279 color terminals and improved password support for better security control. The software runs in IBM DOS/VSE environments.**

FAQS/XP is intended to better DOS system throughput by improving on-line transaction performance and Dasd scheduling and by enhancing console spooling and partition balancing.

According to a spokesman, Version 6 features an improved Console Spooling Facility with the addition of a job accounting report showing CPU seconds, start I/O activity and partition Getvis use for each step in the job, as well as a report showing each phase loaded during job execution.

FAQS/XP Version 6 is priced at $4,760 for a permanent license, or $119 per month for a three-year renewable license.

Goal Systems International, 5455 N. High St., Columbus, Ohio 43214.

PRODUCTIVITY AIDS

■ **Dylakor, Inc. has announced Dyl-Online, an interactive program development tool compatible with the company's DYL-280 and DYL-280 II packages. Dyl-Online runs in the IBM MVS/TSO/ISPF environment.**

The menu-driven Dyl-Online provides a series of prompts to help users select the functions desired,' a spokesman said. Users can choose from three levels of assistance in designing programs. Maximum assistance is provided in the first level, while the third level allows users instant access to IBM's ISPF editor.

Other features of Dyl-Online include automatic job control language generation and syntax checking.

The Dyl-Online system is priced at $17,000 for DYL-280 or $21,000 for DYL-280 II.

Dylakor, P.O. Box 3010, 17418 Chatsworth St., Granada Hills, Calif. 91344.

■ **DBMS, Inc. has announced an automated programming standards package for users of Release 10 of Cullinet Software, Inc.'s IDMS data base management system.**

The Quality Assurance Tool Kit reportedly provides data base administrators with methods and techniques for establishing guidelines for applications development.

The Tool Kit consists of DBMS' existing Standards, Procedures & Guidelines (SP&G) manual, a Standards Administration System Online that provides access to and maintenance of the standards in the SP&G manual and the Enforcer, a batch and on-line program checker for systems developers, the vendor said.

Price of the Quality Assurance Tool Kit is $14,900. It will be available in the fourth quarter.

DBMS, 1801 Mill St., Naperville, Ill. 60540.

■ **Micro Data Base Systems, Inc. has introduced Screen Maker, which allows applications developers to create end-user screen interfaces for Digital Equipment Corp.'s VAX-11/780 under DEC's Ultrix operating system, IBM's PC-DOS and Microsoft Corp.'s MS-DOS.**

A spokesman said Screen Maker allows a user to create and revise screens interactively. Designs are maintained in a screen dictionary. Each screen can consist of a number of windows and frames. Individual help text can be added at each level.

Screen Maker is priced from $2,500 to $5,000.

Micro Data Base Systems, Suite 400, 85 W. Algonquin Road, Arlington Heights, Ill. 60005.

■ **IMSL, Inc. has announced that its IMSL Library is now available for Hewlett-Packard Co. HP 9000 processors.**

The IMSL Library contains more than 500 Fortran subroutines for a range of mathematical and statistical applications, a spokesman said.

The software is intended to reduce the time and expense involved in program development by enabling the programmer to select fully tested Fortran subroutines from the Library rather than writing them.

The IMSL Library is compatible with the HP 9000 Models 520, 530 and 540 running the Fortran 77 compiler under the HP-UX operating system.

IMSL Library is priced at $1,200 for the initial year, renewable at $1,000 a year.

Educational institutions are offered a reduced price, the vendor said.

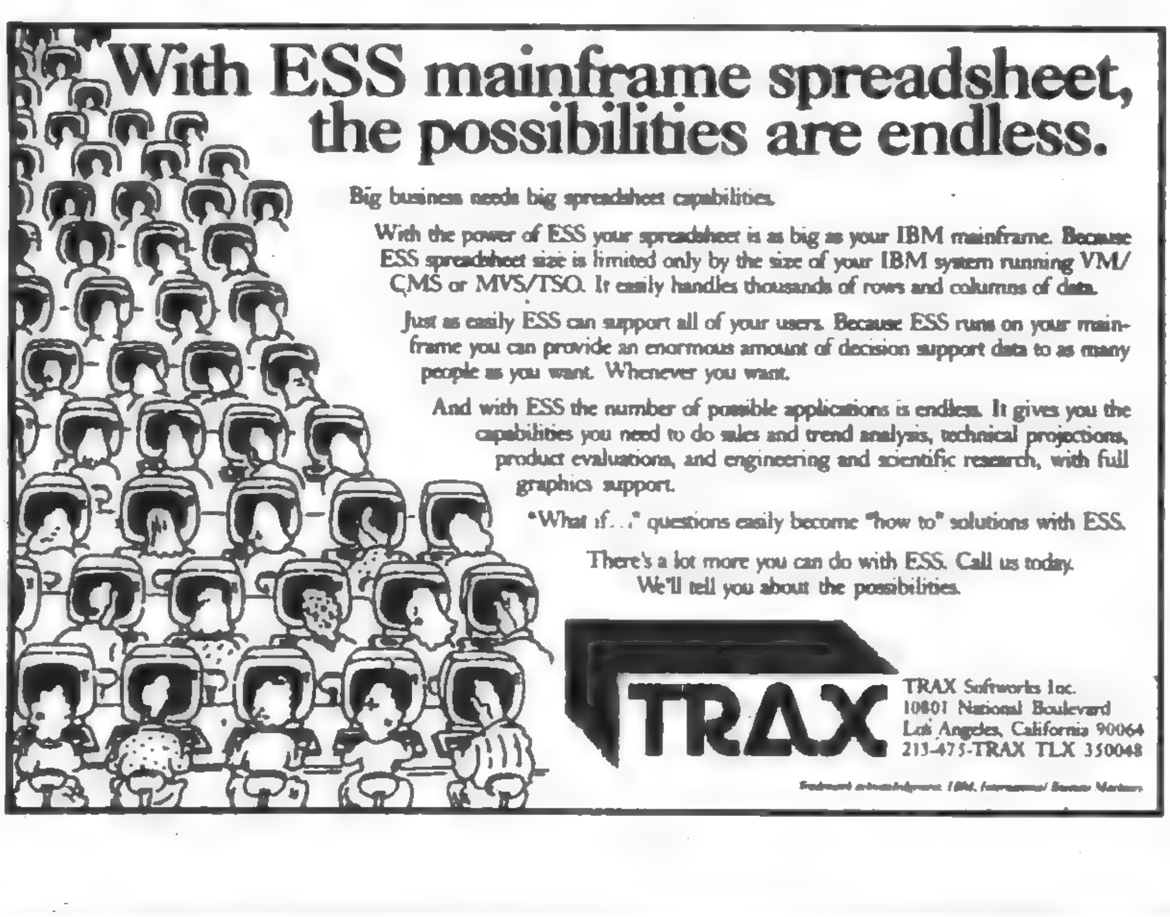
IMSL Sales Division, NBC Building, 7500 Bellaire Blvd., Houston, Texas 77036.

■ **Software Dynamics Corp. has announced an on-line version of Dynatune, its job control language (JCL) optimizer for IBM's OS/VS and MVS operating systems.**

Dynatune On-Line now includes a dynamic reallocation feature that reads existing JCL and minimizes job requirements for disk space allocations and CPU cycles, according to the vendor.

The product costs $5,800.

Software Dynamics, Suite 960, 1800 W. Loop South, Houston, Texas 77027.



With ESS mainframe spreadsheet, the possibilities are endless.

Big business needs big spreadsheet capabilities.

With the power of ESS your spreadsheet is as big as your IBM mainframe. Because ESS spreadsheet size is limited only by the size of your IBM system running VM/CMS or MVS/TSO. It easily handles thousands of rows and columns of data.

Just as easily ESS can support all of your users. Because ESS runs on your mainframe you can provide an enormous amount of decision support data to as many people as you want. Whenever you want.

And with ESS the number of possible applications is endless. It gives you the capabilities you need to do sales and trend analysis, technical projections, product evaluations, and engineering and scientific research, with full graphics support.

"What if..." questions easily become "how to" solutions with ESS.

There's a lot more you can do with ESS. Call us today. We'll tell you about the possibilities.

APPLICATION PACKAGES

■ Data Design Associates, Inc. has announced Release 7.7 of its Fixed Asset Accounting System software, featuring incorporation of tax calculations that conform to the federal Deficit Reduction Act of 1984. Written in Cobol, the program runs in IBM DOS and MVS environments, on IBM's System/38 and on Hewlett-Packard Co. HP 3000 superminicomputers.

Other enhancements include an option for the independent close of corporate and tax books and automatic location lockup.

Data Design's asset type code is intended to increase the user's ability to make accurate projections regarding company assets.

Release 7.7 of Fixed Asset Accounting System costs $30,000.

Data Design Associates, 1279 Oakmead Pkwy., Sunnyvale, Calif. 94086.

■ Digital Equipment Corp. has announced the availability of Interleaf, Inc.'s composite document processing software for the Vaxstation I and II workstations. The Interleaf Workstation Publishing Software runs under the MicroVMS operating system.

The Interleaf applications software enables users to prepare documents containing multiple typefaces and a range of graphics including data-driven business charts. Through a mouse-driven interface, users can access all editing and formatting resources necessary to produce original typeset documents.

The price for the Interleaf Workstation Publishing Software, scheduled for summer availability, is $3,000.

DEC, 146 Main St., Maynard, Mass. 01754.

■ AT&T Information Systems has announced accounting software for AT&T 3B series computers and its Unix System V operating system.

AT&T Glows consists of five integrated modules. A write-up module automates the analysis and consolidation of general ledger accounts. An audit module includes capabilities for preparing lead sheets, work papers and financial statements for clients who maintain their own financial records. An After-The-Fact Payroll Accounting module can be used for preparing payroll data and federal W-2 forms.

Fixed Assets Reporting includes capabilities for calculating fixed-asset depreciation for up to 8,000 assets and the 1099 System helps with the analysis of company records and end-of-year federal 1099 statements, a spokesman said. The product is priced at $3,495.

AT&T Glows Practice Management (PM) includes modules for due data monitoring, staff-time scheduling, expense and work-in-process billing functions, fee collections and cost analysis. AT&T Glows PM is priced at $2,495.

AT&T Glows and AT&T Glows PM together are priced at $5,495.

AT&T Information Systems, 10 Southgate Pkwy., Morristown, N.J. 07960.

■ Xerox Corp. has announced the Repetitive Manufacturing module for its Xerox Business Management System, with features for reducing inventories and decreasing material flow time from vendor delivery to shipment of finished goods. The package runs in IBM SSX, DOS/VSE, MVS and VM environments.

Repetitive Manufacturing is reportedly intended to eliminate work orders, increase the accuracy of work-in-process accounting balances and decrease paperwork. The application is directed at medium- to high-volume customers whose production is driven by daily or weekly production rates.

The product permits time-phased allocation of material by a work center in priority sequence, back-flushing of work in process through one or more work centers, lot tracking and automatic consumption of components from line receipt to completion of the end item and use of delivery policies to schedule vendor deliveries efficiently.

Prices for the Repetitive Manufacturing module begin at $75,000, according to the vendor.

Xerox Computer Services, 5310 Beethoven St., Los Angeles, Calif. 90066.

SOFTWARE & SERVICES

■ Software International Corp. has announced an enhanced version of its General Ledger & Financial Reporting System, which now supports Wang Laboratories, Inc. Wang VS series minicomputers.

Other enhancements to General Ledger & Financial Reporting Release 5.2 include on-line screen painting capabilities, on-line editing of standard journal entries and rewritten documentation, a spokesman said. The system can also be used with the global variables and return-code checking functions used in Wang's procedure language.

The product's on-line journal function, known as Trace, allows the user to develop exception displays and display transactions for only one employee. A Hero function is a mass maintenance facility that allows users to copy accounts within one entity or add an account in all entities.

Prices for the General Ledger & Financial Reporting System for the Wang VS range from $18,000 to $33,000.

Software International, 1 Tech Drive, Andover, Mass. 01810.

■ Applied Data Research, Inc. (ADR) has added a calendar and scheduling facility to Release 2.0 of ADR/Email, its electronic mail system for IBM's DOS/VSE, OS/VS1 and OS/MVS environments.

ADR/Email 2.0 includes Edate, which allows users to schedule appointments and view other calendars. The function allows users to preschedule recurring or standard events, issue reminders of upcoming events and scan calendars for unscheduled time.

A permanent license for ADR/Email, including Edate, is $45,900 for OS/VS1 and MVS environments and $32,400 for DOS/VSE systems.

ADR, Rt. 206 & Orchard Road, Princeton, N.J. 08540.

■ Precision Visuals, Inc. has announced an enhanced version of its GK-2000 graphics software tools for Digital Equipment Corp.'s VMS on the VAX superminicomputers and IBM's VM/CMS and MVS/TSO operating systems.

GK-2000 Extended implements Level 2B of the evolving Graphical Kernel System, an international standard adopted by the International Standards Organization. The product includes features that allow the display picture to be repositioned, rescaled, highlighted, combined, deleted and redrawn, a spokesman said.

GK-2000 reportedly allows users to configure segment storage and add floating-point coordinates for use with high-precision graphics devices. The graphics software also features extended error processing, on-line debugging, a pause function for examining images and file name control.

GK-2000 Extended is priced between $6,500 and $21,000.

Precision Visuals, 6260 Lookout Road, Boulder, Colo. 80301.

■ Tektronix, Inc. has announced Tektronix Caddport for design documentation. The product is said to link Tektronix Plot 10 Computer-Aided Drafting Software, Teknicad, with PDA Engineering's Patran Solid Modeling and Analysis System.

Teknicad runs on Tektronix terminals and mainframes and the Digital Equipment Corp. VAX superminicomputers.

Patran design information is carried to Teknicad via Caddport. Patran produces various product design views, and Caddport processes the views so they can be interpreted and manipulated by Teknicad to produce the design documentation, the vendor said.

Caddport license fees start at $2,010; Teknicad license fees start at $2,200; and Patran license fees start at $8,000.

Tektronix, P.O. Box 1700, Beaverton, Ore. 97075.

■ Balco Data, Inc. has announced Release 5.0 of its Warehouse Distribution and Financial Control Application Software for the Hewlett-Packard Co. HP 3000 minicomputer.

According to a spokesman, the software consists of the following modules: order management, accounts receivable, inventory manage-

Continued on page 54

YOUR TWO FAVORITE COMPUTERS NOW HAVE ONE THING IN COMMON. YOUR FAVORITE GRAPHICS TERMINAL.

Introducing the new CX4100 Series of Tektronix high performance, yet affordable color graphics terminals.
Now you can have the Tektronix PLOT 10 graphics command set you've always wanted while you use the host of your choice, IBM or DEC. Just by typing a single "switch-host" command.

Familiar 3270 IBM-style alphanumeric output is fully emulated on all CX4100 terminals. Enhanced IBM-style keyboard is part of the package.

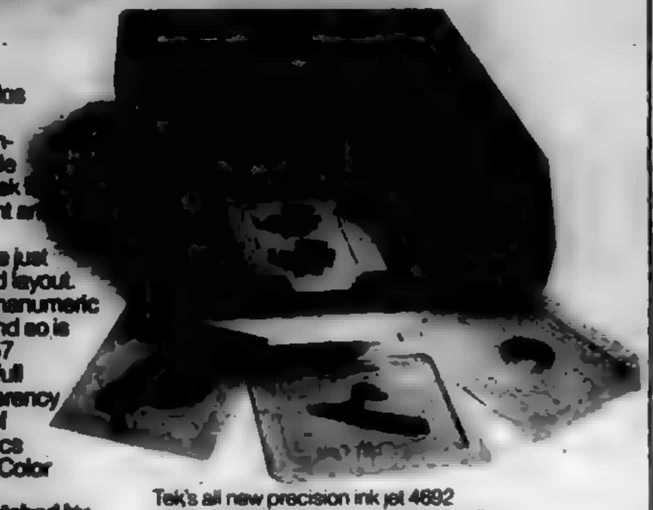
Tek's CX4106, CX4107 and CX4109 are all directly plug compatible with both host environments. One coax to a standard IBM 3270 controller is all you need or one RS-232 connection to your DEC system.

To make your use of existing or new graphics data fast and friendly, the CX Series comes with an IBM-style keyboard. Plus Tek enhancements: individual key programmability, user-selectable ten-key pad, and joydisk for quick cursor movement and graphics input.

Screen output will be just as familiar as keyboard layout. 32-line 3278/3279 alphanumeric emulation is built in. And so is full support for the 4957 Graphics Tablet, plus full hard copy and transparency output to a full range of Tektronix Color Graphics Copiers and the 4510 Color Graphics Rasterizer.

IBM flexibility is matched by DEC flexibility. In RS-232 mode, the terminals can run all VT100 applications through the extended ANSI X3.64 command set. In addition to the host interface port that transmits data at rates up to 38.4k baud, CX terminals are provided with two additional RS-232 ports and a Centronics-style parallel port for connecting a wide range of peripherals.

But best of all you'll have great graphics and full software compatibility. The CX Series will accept many existing programs written for 4010, 4100, and 4110 Series terminals. And they're fully compatible with PLOT 10 IGL, GKS, and TCS programs as well as with popular third-party software such as SAS/GRAPH,® ISSCO's DISSPLA® and TELL-A-GRAF® and Precision Visuals' DI-3000.®



Tek's all new precision ink jet 4692 color copier produces very high quality full color transparencies or hard copy.

That's software investment protection—matched by technology protection. CX terminals feature a 60 Hz non-interlaced display with 4096 x 4096 addressability displayed in a 640 x 480 matrix.

16 colors, eight line styles, 11 marker types, rapid area fill, scalable/rotatable text, complete segment support, true zoom and pan, and separate dialog area. It's all there with the full PLOT 10 command set.

So don't wait. Set the best of three worlds on one desk: TEK, DEC, and IBM. Contact your local representative today for information on the CX4100 Series. Call 1-800-547-1512. In Oregon 1-800-452-1877.

Tektronix

SOFTWARE & SERVICES

Continued from page 53

ment, warehouse locator, purchasing control, sales analysis/salesman commissions, accounts payable/cash management and general ledger/budgetary control.

The product's distribution module has been enhanced to generate more than 1,000 reports on demand, according to the vendor.

The inventory management module is said to provide the ability to maintain inventory status in 99 different warehouses and includes the capability to issue inventory shortage reports and an interface with a purchasing control system to generate purchase orders.

A Lot Control subsystem enables the distribution application to set up individual lots with a termination date for each lot, the spokesman said.

The product's modules are priced from $9,800 to $22,700.

Bakco Data, Suite 190, 85 W. Algonquin Road, Arlington Heights, Ill. 60005.

■ Sperry Corp. has announced that P-Stat, Inc.'s P-Stat System, an interactive system that combines a data management facility with statistical capabilities, is now available for Sperry's Series 1100 mainframe systems.

According to a spokesman, P-Stat software offers statistical analysis, data display, report writing and cross-tabulation capabilities. It features an on-line Help facility, interactive data entry, relational data base capabilities, a range of statistical commands and expandability through a user link facility.

A P-Stat lease for the Sperry 1100 is $8,000 for the first year, and $3,000 for each successive year, the vendor said. A permanent license for P-Stat on the Sperry 1100 is $15,000 or $5,000 for educational institutions.

Sperry, P.O. Box 500, Blue Bell, Pa. 19424.

■ Data Processing Services, Inc. has added serial number and lot number tracking features to its Distribution Processing System for the IBM System/38.

DPS/38 is written in RPG-III and includes order processing, accounts receivable, inventory control and purchasing and sales analysis modules, the vendor said. The product reportedly supports multicompany and multiwarehouse processing. Users can access a detailed history through inquiry commands.

DPS/38 can be integrated with the company's FIN/38 accounts payable package via user-defined tables.

DPS/38 costs $47,000.

Data Processing Services, Suite 100, 11712 N. Michigan Road, Zionsville, Ind. 46077.

■ Exeter Software Ltd. has introduced an apparel distribution planning and control package for IBM System/38 minicomputers.

Warehouse Management System (WMS)/Apparel reportedly tracks merchandise at the stock-keeping unit levels and considers variable order-filling cycles and the apparel industry's preshipping procedures. An on-line query and reporting capability for stock locations is said to facilitate inventory control.

The product also includes capabilities for automatic auditing of inventory changes, the vendor said. WMS/Apparel reportedly can receive information on stock that has been put away and can generate shipping documentation.

The product is licensed for $245,000.

Exeter Software, 100 Turnpike Road, Chelmsford, Mass. 01824.

■ MCBA, Inc. has announced a product routing package for manufacturers with a Wang Laboratories, Inc. VS series minicomputer.

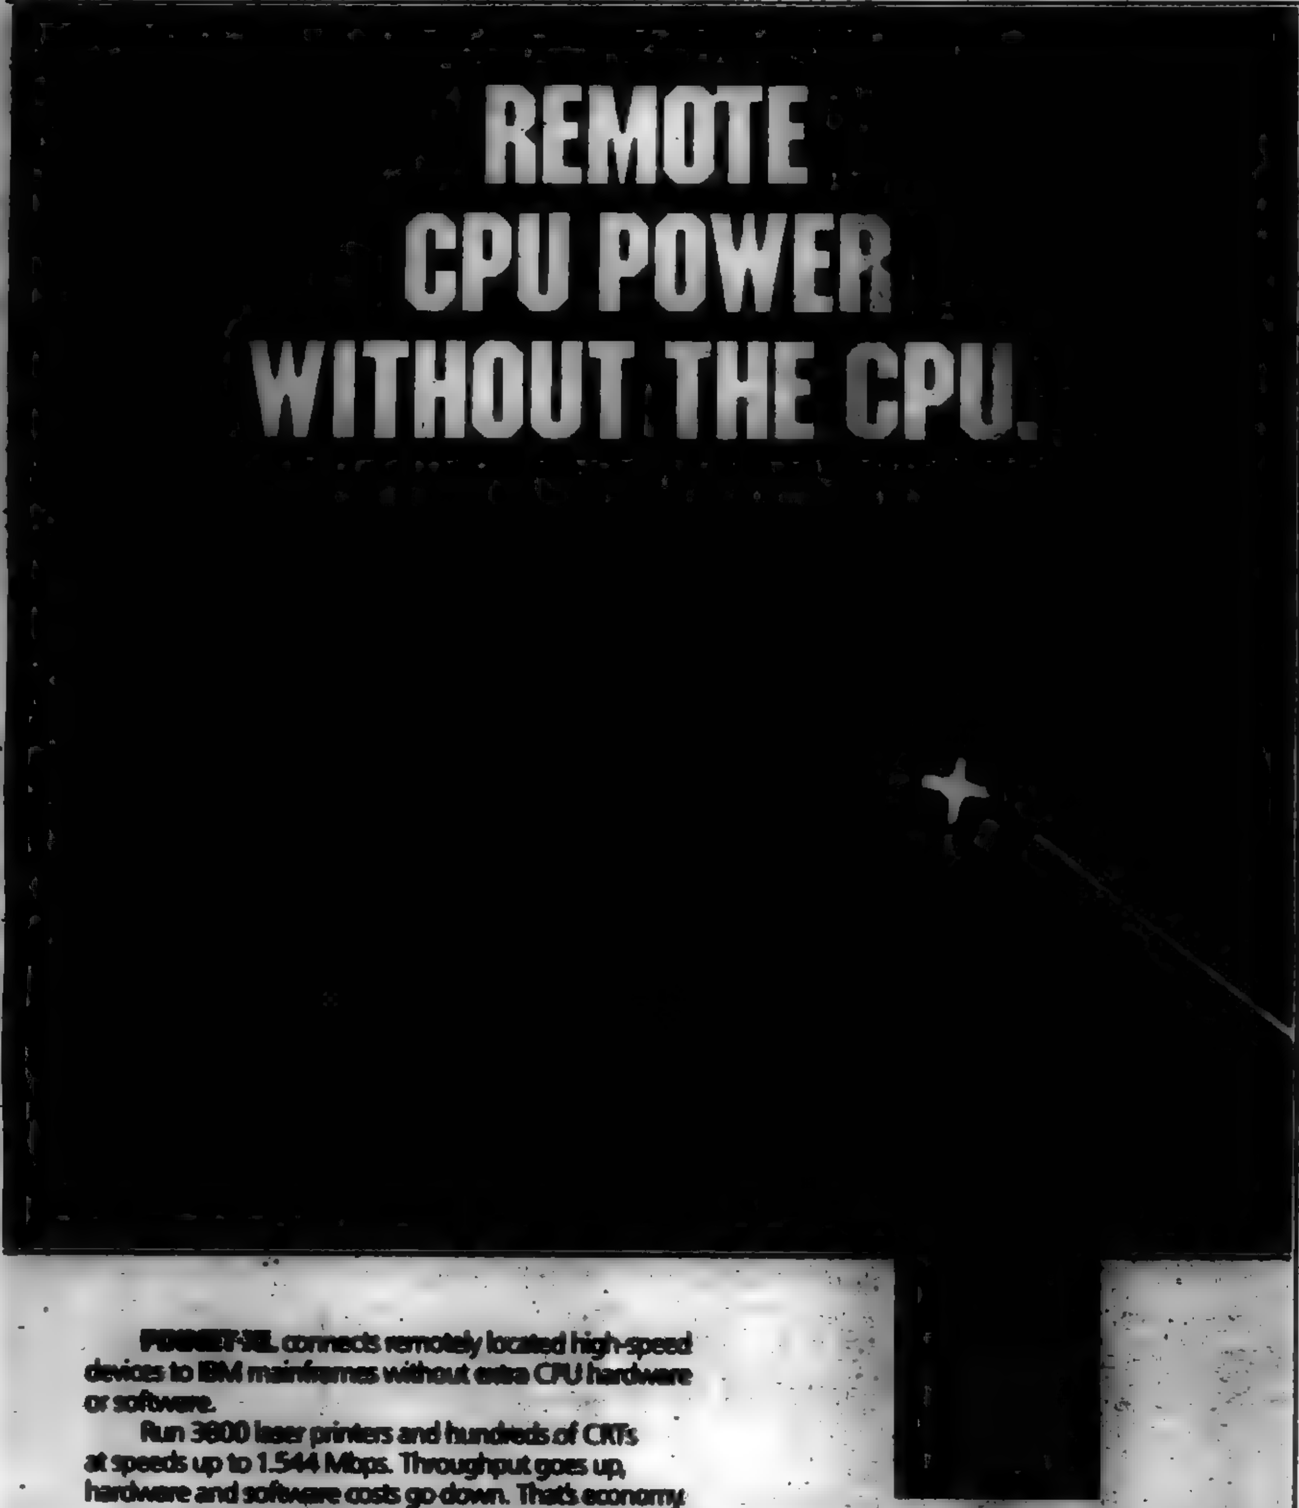
Standard Product Routing (SPR) controls the sequence of operations, tool and assembly instructions for product manufacturing, a spokesman said. The software reportedly permits interactive entry and editing of routing data and maintains labor and machine hour standards at the operations level.

SPR allows users to create new routings by copying portions of existing ones. It provides alternate routings and supports a variety of operation types.

SPR is priced from $2,500 to $3,500, depending on configuration.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

See ABS page 56



PIXNET-XL connects remotely located high-speed devices to IBM mainframes without extra CPU hardware or software.

Run 3800 laser printers and hundreds of CRTs at speeds up to 1.544 Mbps. Throughput goes up, hardware and software costs go down. That's economy.

And to ensure ongoing network performance we cover everything from customer education to worldwide field service.

Cut the costs of remote processing with CPU speed and performance by PIXNET-XL. For information, write
PARADYNE CORPORATION,
P.O. BOX 1347, LARGO, FL 33540.

paradyne

Only Sperry can make the following four statements.

Our PC runs the XENIX™ system, as well as MS-DOS™.

Our 4 new microcomputers run the UNIX system.

Our new minicomputer runs the UNIX system.

Our Series 1100 mainframes run the UNIX system.

All of which means there is a great deal we can do for you.

For instance, our family of computers based on UNIX systems has incredible transportability for all your software.

And being able to accommodate from two to hundreds of users, it's impossible to outgrow our hardware.

Of course, this linking of all your computer systems can add measurably to your productivity.

And a fast way to find out more is to get a copy of our Sperry Information kit. For yours, or to arrange a demonstration at one of our Productivity Centers, call **1-800-547-8362.**

*UNIX is a trademark of AT&T Bell Laboratories

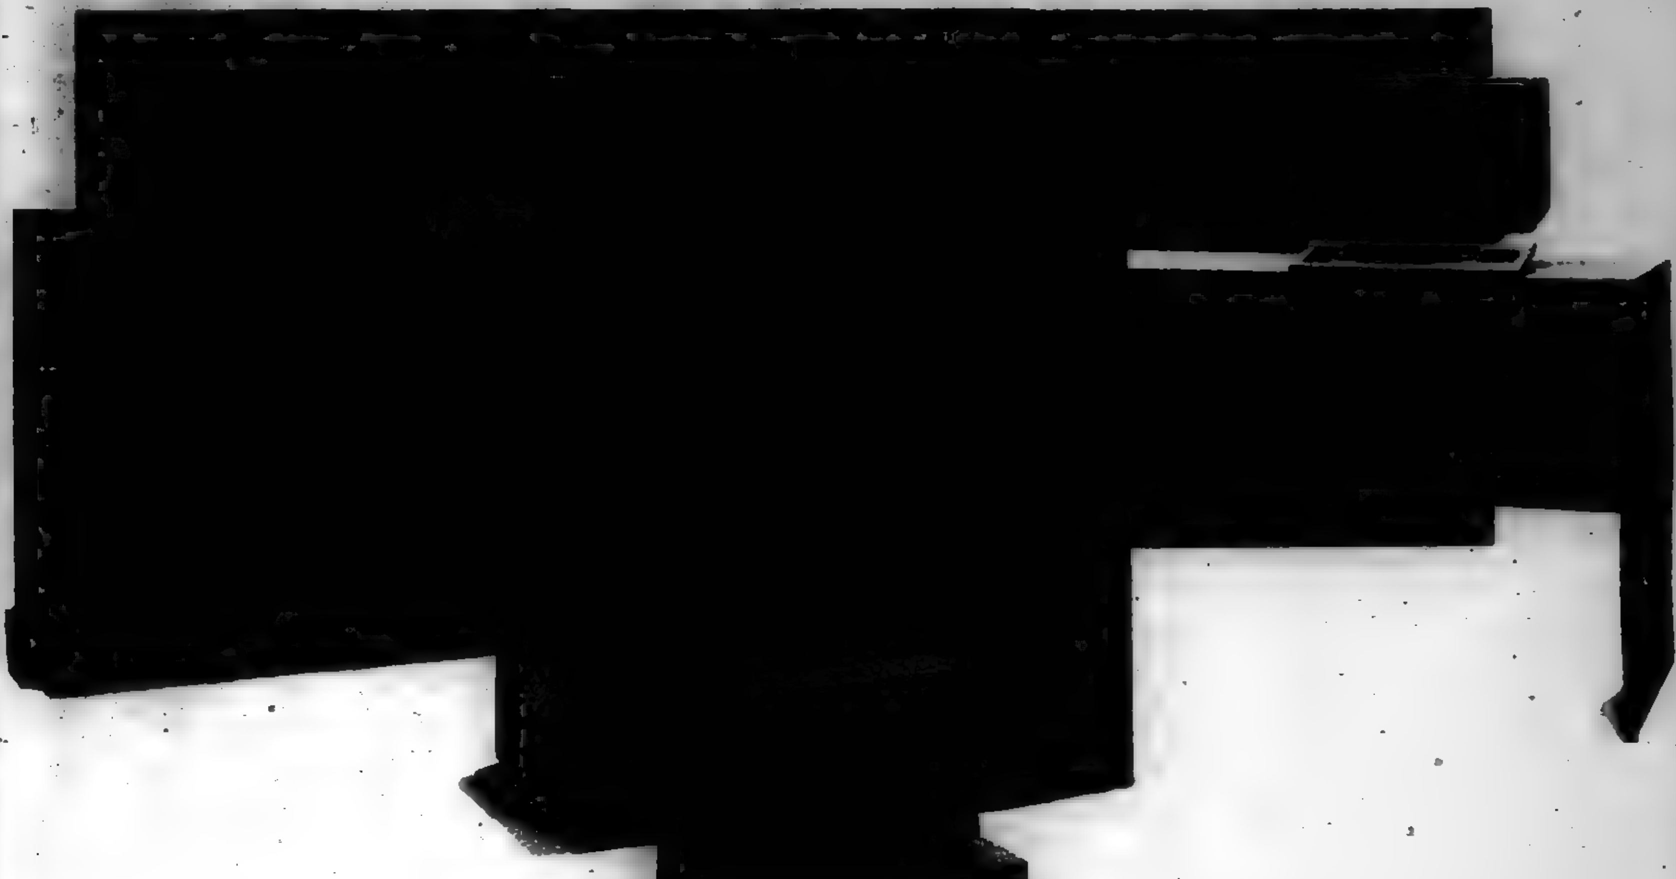
Introducing an idea that makes obsolescence obsolete.



The UNIX* operating system from PC to mainframe.

SOFTWARE & SERVICES

AIDS

from page 54

■ **Digital Equipment Corp. has introduced an enhanced version of its integrated spreadsheet program for its VAX and Microvax computers.**

VAX Decalc Version 2.1 enhancements include financial, statistical, logical and trigonometric functions. The product supports DEC's VT100 and VT200 series terminals and integrates with DEC's Datatrieve data base management program, Decgraph graphics capabilities, electronic mail and network support for information acquisition and distribution.

VAX Decalc Version 2.1. financial functions include capabilities for determining discounted payback.

Prices for VAX Decalc Version 2.1 begin at $680.

DEC, Box 1003, 2 Iron Way, Marlboro, Mass. 01752.

■ **EEC Systems, Inc. has announced four software products for users of Digital Equipment Corp. minis.**

RJ-11 Cobol is said to be a Cobol compiler for the DEC RSX-11M operating system running on DEC PDP-11 minis. The RSX-11M version is priced at $4,000.

EEC Systems' VRT reportedly allows the user to run RT-11 software under the VMS operating system on DEC VAX-11 series machines. RT-11 programs running under VRT are said to have direct access to files in VMS directories. VRT is priced at $1,000 for a single CPU.

Filetab-D is a programming language and applications development program for the PDP-11 and VAX series. The product uses decision tables for debugging, program maintenance and documentation, according to the vendor. Filetab-D is priced between $1,000 and $7,500, depending on the operating system.

EEC also announced Greek Math capability enhancement of its LEX-11 word processing software for DEC computers using VT220 terminals. The enhancement is said to support all major printers and character sets and is available for $75.

EEC Systems, 327/E Boston Post Road, Sudbury, Mass. 01776.

■ **Integrated Planning, Inc. has announced an enhanced version of its decision support system for IBM mainframes running VM/CMS or MVS/TSO, Digital Equipment Corp.'s VAX series and Prime Computer, Inc. systems.**

Stratagem 4.7 combines a data base management system with modeling and reporting tools. It is an integrated planning environment that features capabilities for financial modeling, statistics, graphics and an applications development language.

Enhancements include an improved report generator and an on-line Help facility. Also added were functions that compute running totals of values in an array and that return the midpoint of the functions stored in an array and allow users to restrict the operation to specific dimensions of the array.

Stratagem costs from $25,000 to $70,000 for minicomputer systems and $85,000 for IBM mainframes.

Integrated Planning, 338 Newbury St., Boston, Mass. 02115.

■ **SDK Healthcare Information Systems has introduced a nursing management system for computers that support Ansi-standard Mumps.**

Components of the SDK Nursing Management System include Patient Acuity Classification, Nurse Staffing and Scheduling and Management Report Generation. Data can be entered directly at nursing stations or be collected on system-generated worksheets containing census and patient classification data. The system calculates acuities and reports staffing requirements by shift and station.

SDK Nursing Management System is priced from $15,000 to $40,000, depending on hardware configuration.

SDK Healthcare Information Systems, 1550 Soldiers Field Road, Boston, Mass. 02135.

■ **Oakland Management Services has announced the Automotive Release Management System (Arms) for IBM's System/36 and 38.**

A spokesman said Arms lets suppliers receive order release information from General Motors Corp., Ford Motor Co., Chrysler Corp. and American Motors Corp. Order release information can be transferred to the supplier's production scheduler. After the order is scheduled for production, advanced shipping notices are sent to the manufacturer.

Arms is priced at $6,000 per module for the System/36 and $8,000 per module for the System/38.

Oakland Management Services, P.O. Box 1019, 1754 Maplelawn, Troy, Mich. 48099.

■ **Digital Equipment Corp. has announced Decjobmatch, an applications and job requisition package for DEC's VAX series of superminis.**

Decjobmatch includes applicant tracking, job requisition entry and control, applicant resume entry and job searching capabilities. The software reportedly also offers an applications mangement function.

Decjobmatch can be interfaced with DEC's All-In-One and Datatrieve data base management system software.

The product price ranges from $9,000 for the VAX-11/730 up to $27,000 for the VAX-8600.

DEC, 146 Main St., Maynard, Mass. 01754.

■ **Megatek Corp. has announced Contemplate, an engineering graphics package for use with Megatek's Template subroutine library.**

The product allows engineers to design interactively graphs and

Closed systems
are
the products of
closed minds.

Sun
workstations:
the open systems
from
open minds.

Sun Microsystems™ has declared open season on proprietary computer systems. And the closed minds that design them.

Sun's open attitude holds that no one should be dependent upon any one company to meet their every computing need. Because, at the speed technology is moving, any one who has to wait for their proprietary vendor to develop its own version of the latest breakthrough is going to get closed out. Period.

Full integration of proven industry standards gives Sun workstations performance equal to proprietary systems, without sacrificing compatibility. So, we give our customers the open opportunity to incorporate state-of-the-art products from a wide variety of vendors.

Sun workstations are designed to serve as the bedrock for a distributed information network. An open-ended network that overcomes the limitations previously imposed upon the users of proprietary systems: noncommunication with existing computer investments, single-vendor delays in incorporating new technologies, high single-vendor prices, and all the other exciting advances closed minds have brought us.

Distributed Computing Network

Sun's family of workstations epitomize the new, open attitude of the computer industry, elegantly incorporating an open system architecture with the distributed power and speed necessary to create a complete development environment. A powerful Motorola 68010 CPU. A multi-tasking UNIX™ operating system. High speed Ethernet networking. Direct Virtual Memory Access and support of diskless operations. An advanced window system. Advanced programming tools. And more.

The free exchange of ideas is at the heart of any successful business endeavor. So, Sun created the Network File System (NFS). NFS allows members of your engineering and software development groups to communicate with one another, with other computing resources (i.e. mass storage devices, supercomputers, etc.), *and* with a variety of computers already in use in other departments.

With NFS, the left side of your corporate brain will always know what the right side is doing. And the brain trust that results can really move a project along.

Open Market Options

But compatibility between Sun workstations and your existing computer investment is just the beginning. Today, a multitude of third-party companies in the "open" market are developing and aggressively marketing software, peripherals and add-on equipment for Sun workstations. CAD/CAM/Computer-aided-just-about-anything. Electronic publishing. Languages for artificial intelligence. Programming tools. And many, many more technical and general business applications.

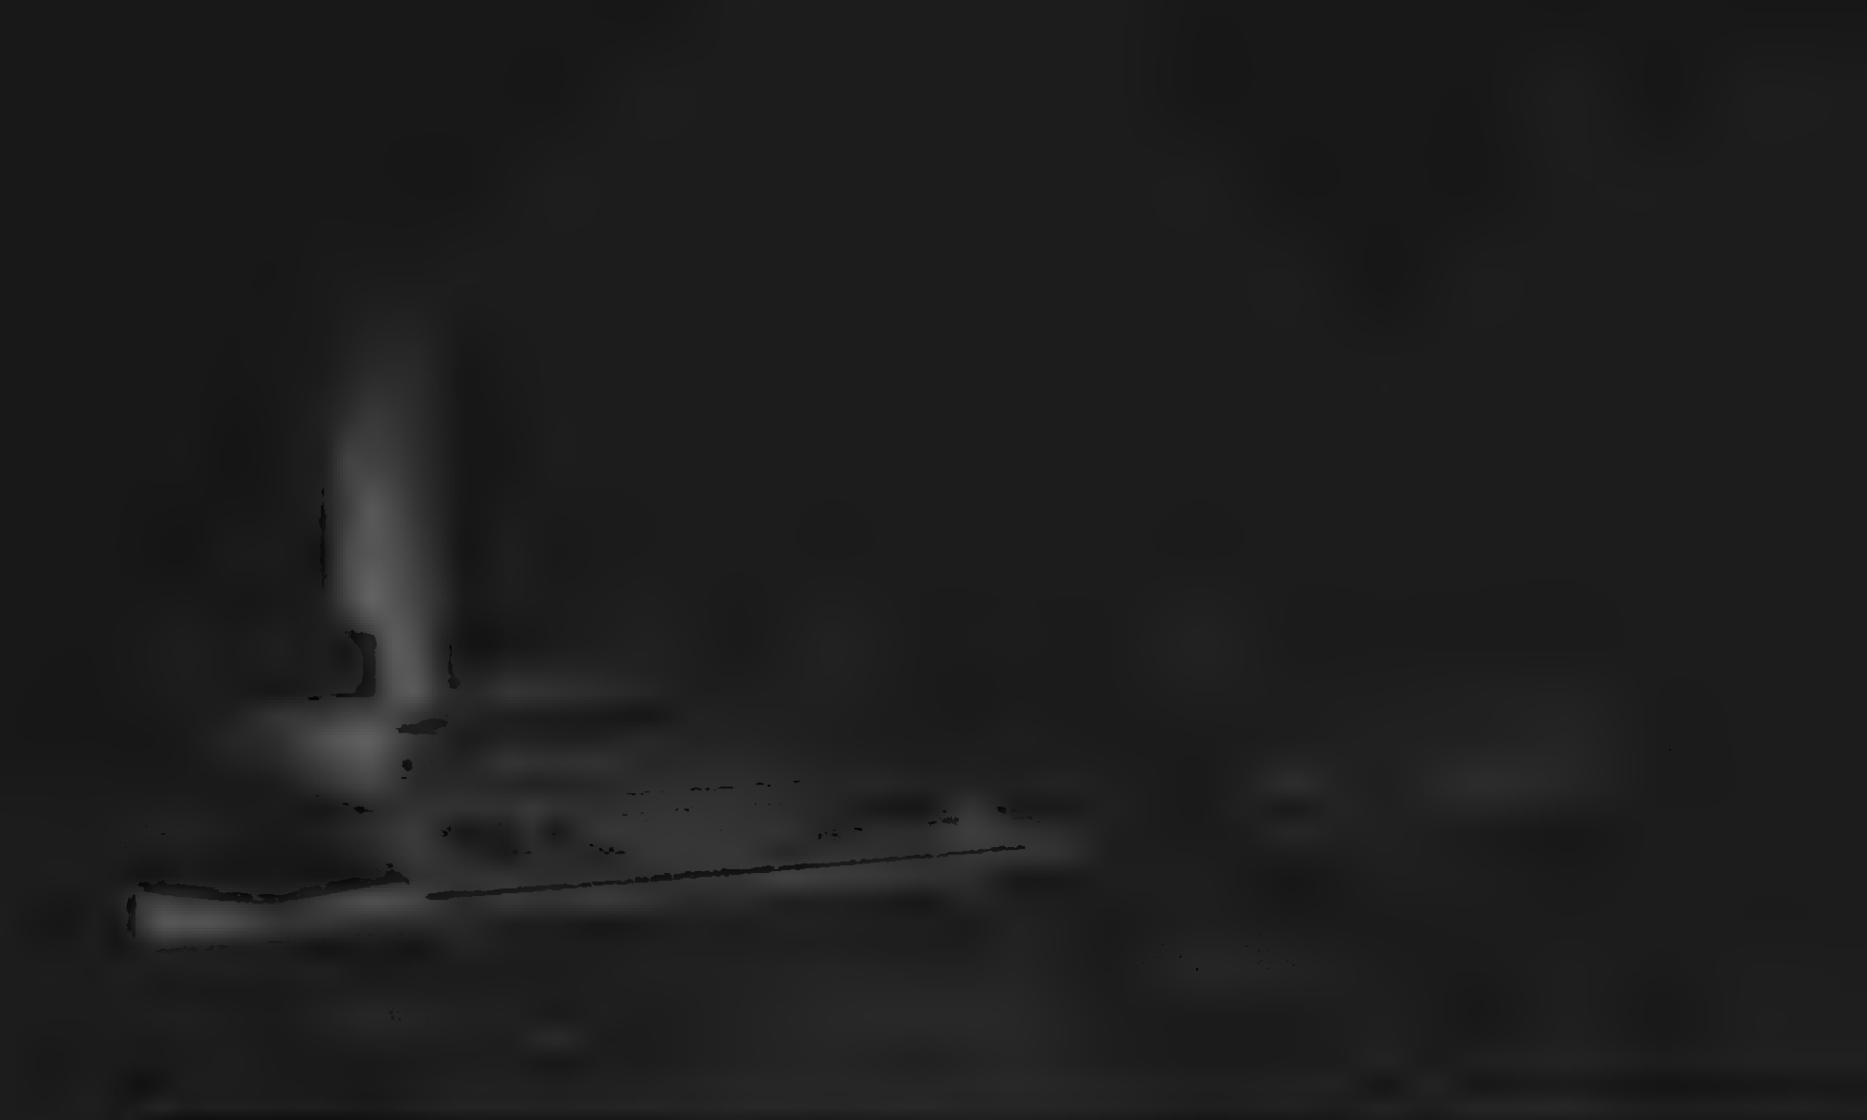
Sun workstations have earned a reputation among third-party vendors as the open door to the UNIX market. Consequently, the number and diversity of products for Sun systems grows daily. Spurred by this competitive atmosphere, open market companies provide Sun customers with the latest technology, fast. At highly competitive prices.

If you like the sound of what you're reading, you're not alone. Many Fortune 1,000 companies, the U.S. Government, and over 100 top universities are already on Sun's client list.

And, in a pleasant juxtaposition of business realities, the best cost less. Sun workstations can cost substantially less than comparably equipped closed systems.

It's an open and shut case. You can either try to explain to your board of directors why you've put all their corporate eggs into one, proprietary basket. Or, you can look them square in the eye and tell them it's time they developed a more open attitude.

UNIX is a trademark of AT&T Bell Laboratories.



Sun workstations: open architecture, open network, open options.

Sun workstations are in the vanguard of the open rebellion against proprietary computer systems. And the closed minds that design them.

Sun Microsystems designed its full line of general purpose workstations around industry standards for hardware, software and data communications. And the unique combinations that resulted have created the nucleus for a distributed computing network: an open information network.

Just For Openers

Each Sun Workstation® gives its user a dedicated 32-bit CPU. Up to 8 megabytes of main memory. Integrated high-speed networking to allow sharing of information and peripherals across a network of Sun workstations or multi-vendor systems. High resolution graphics display. Advanced user interfaces, and more. Sun workstations work at the speed of thought, so your people spend less time waiting on the system. Less time getting projects completed, and products out the door.

The open attitude built into every Sun workstation begins with an advanced version of the industry-standard UNIX operating system, supporting demand-paged virtual address spaces, fast I/O to disk and local network, diskless operations and multiprocessing. Fast hardware combines with more than 220 UNIX utilities, three programming languages (C, Fortran, Pascal), SunCore™ graphics library, SunWindows,™ plus additional tools, to create the most productive computing environment available today.

The Sun workstations' advanced Motorola 68010 microprocessor supports virtual memory of up to 16 megabytes per process. This allows users to develop applications larger than the amount of available main memory without complicated overlay schemes. And the Sun memory management unit allows the processor to access all of main memory with no "wait" states.

Sun Network File System

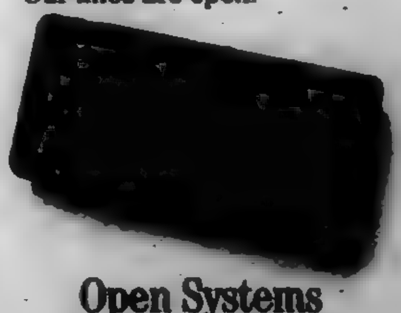
Perhaps most exemplary of Sun's total commitment to open system architecture is the Sun Network File System (NFS). NFS allows users to transparently access files across an information network of Sun workstations or a variety of multi-vendor machines. Via this network, teams of professionals can cooperate on project work, accessing any specialized computing resources they need.

Since Sun NFS is independent of any particular hardware or operating system, it will evolve with developing network and computer technologies. And as part of our commitment to industry standardization, we're making our NFS an open book to interested parties in the hopes of filling the need for an efficient standard in this crucial area.

Sun's choice of industry-standard, 10 megabit-per-second Ethernet greatly simplifies the task of building Sun workstation or multi-vendor networking environments. Sun workstations also implement standard TCP/IP protocols and support both Multibus® (IEEE-796) and VME backplanes with up to fifteen slots.

Open architecture means open options. Sun workstations give you a long list of powerful standard features and options, built around proven industry standards. *Plus*, an abundance of third-party hardware and software companies working to open new doors for you and your company.

To find out more about Sun's open attitude and the workstations that have evolved from it, write: Sun Microsystems, Inc., 2550 Garcia Avenue, Mountain View, CA 94043. Or, simply call (800) 821-4643. In California (800) 821-4642. Our lines are open.



Open Systems for Open Minds.

charts using logical graphics input devices. Users can design charts with several axis options. It can perform algebraic calculations for data analysis or manipulation. .

Contemplate is priced from $3,700 to $27,000, depending on configuration.

Megatech, 9645 Scranton Road, San Diego, Calif. 92121.

■ **Honeywell, Inc. has announced that Execucom Systems Corp.'s Interactive Financial Planning System (IFPS) is now available on Honeywell's DPS 6, DPS 88 and DPS 90 mainframes running Gcos 8.**

The IFPS is a decision support system and modeling package that uses a set of built-in routines for frequently used computations. The product includes functions for testing hypotheses. A report writer produces ad hoc and formal reports from models and existing files.

IFPS is priced from $40,000 to $69,000.

Honeywell, P.O. Box 8000/A-79, Phoenix, Ariz. 85066.

■ **The Bridge, Inc. has introduced an enhanced version of its Trak project management software for IBM mainframes running DOS/VSE or OS/MVS.**

Trak 2.3 includes functions for on-line employee work load forecasting, project scanning, as well as improved data access security, and enhanced project-level Gantt charts, the vendor said.

Trak 2.3 costs $9,900.

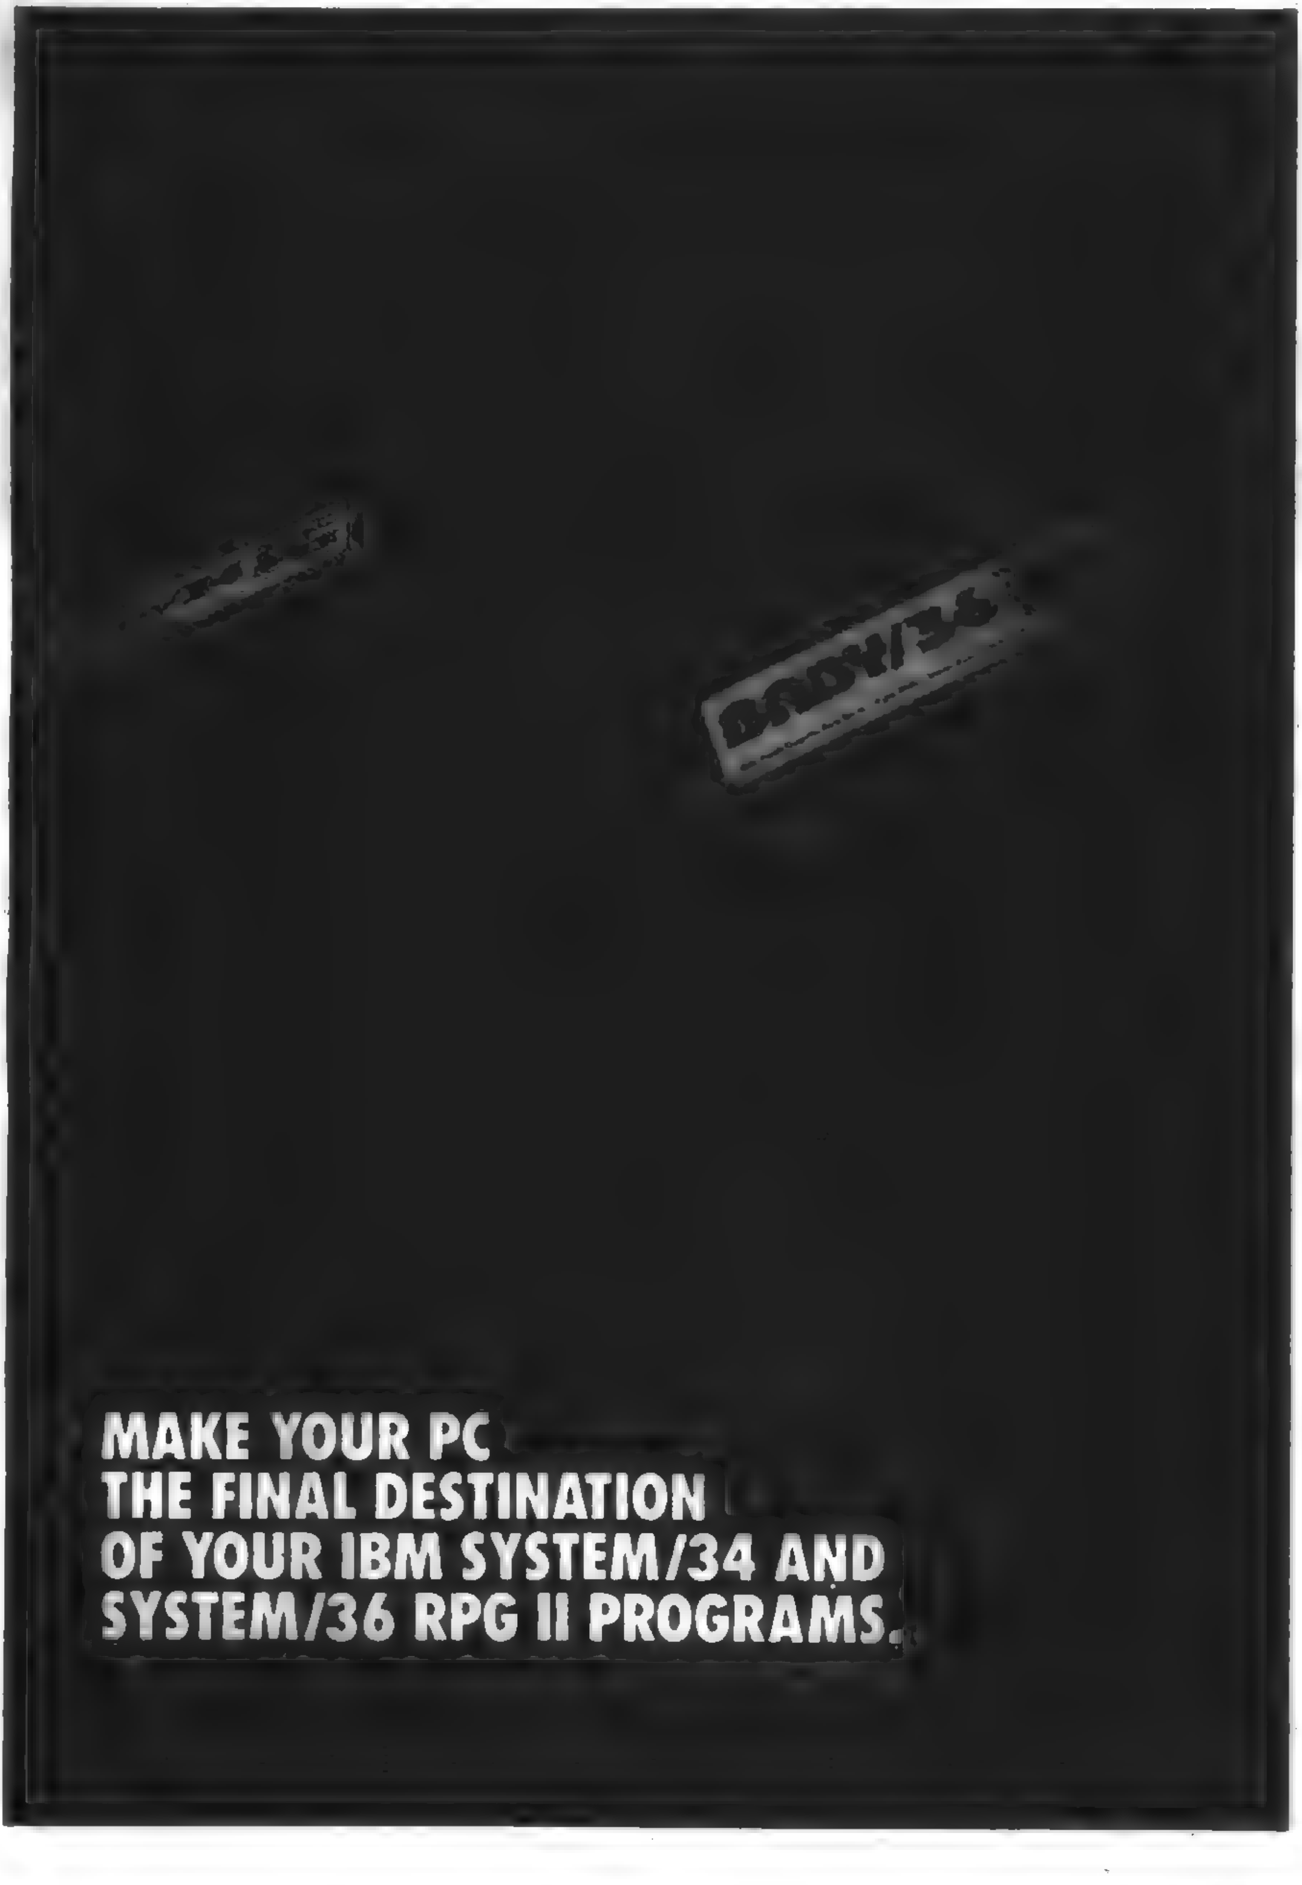
The Bridge, 199 California Drive, Milbrae, Calif. 94030.

■ **Software Express has introduced accounting software for several versions of the AT&T Unix operating systems, Pick Systems' Pick operating system and Microsoft Corp.'s Xenix operating system.**

Accountant's Client Write-Up provides users with audit tracking and report-generation capabilities, the vendor said. It is compatible with other Software Express accounting packages.

The product costs $3,500.

Software Express, 2925 Briarpark Drive, Houston, Texas. 77042.



■ **Jonas & Erickson Software Technology, Inc. has announced a Contractor Estimating System for the MAI Basic Four, Inc. 2000 and 8000 series minis.**

The Contractor Estimating System performs cost calculations, estimate summaries and estimate analyses. The package is integrated with the company's other construction industry software, including job costing and scheduling, equipment costing and analysis, bidding, fixed-asset control and trucker billing.

The Contractor Estimating System costs from $2,000 to $6,500 depending on the hardware chosen.

Jonas & Erickson Software, Suite 700, 235 Yorkland Blvd., Willowdale, Ont., Canada M2J 4Y8.

■ **Fusion Products International has announced Version 3.0 of Fusion/4 Information Retrieval, its fourth-generation report writer for the IBM System/38.**

Version 3.0 boasts performance improvements of roughly 150% over Version 2.0. Security features have been simplified, support for a multiple data dictionary has been added, Help text has been expanded and documentation has also been improved.

Reports created by users may be executed immediately or compiled into machine language for better performance, an option which now appears on the Fusion menu. The report is compiled automatically when its identifying number is entered at a prompt. An added Data Base Administrator feature decides which reports will be processed interpretively and which will be compiled.

Fusion/4 Version 3.0 is available in English, German, French and Kanji (Japanese) language versions. A single-copy license is $7,000.

Fusion Products International, 900 Larkspur L.C., Larkspur, Calif. 94939.

■ **Keane, Inc. has introduced a hospital information system for the IBM System/36.**

Hospital Information System/36 (HIS/36) consists of a

The Right Information at the Right Time... at No Charge to You from Comdisco

Now Available On Cassettes!

Our Comline Reports have proved so popular, we put the latest issues on cassettes. Now you can keep current at your convenience. . .at home, in the car, or wherever your busy schedule takes you. On tape or in print, Comline Reports will keep you up-to-date on the issues that impact your company, your data center, and your equipment planning decisions.

The Information Crunch

Today's data processing professionals are required to be practiced technicians, inspiring managers, and masters of all that's new and current. Responsible for day-to-day operations as well as keeping management informed of the big picture, it's no wonder that DP managers have little time for in-depth analyses of critical industry issues.

The "COMLINE" Solution

Comdisco's Comline Reports are a means through which industry professionals can take advantage of the experience and information which flows through our technical, financial, and marketing channels. Authored by Comdisco's Professional Resource Team, Comline Reports are loaded with valuable insights to help you manage your operation more successfully in today's changing DP environment.

Why Comdisco?

Comdisco is the world's largest remarketer of IBM computers and peripherals, and has consistently set the standard of excellence in the computer leasing industry since 1969. Today, our role in the industry as authorities and advisors on data processing topics has expanded dramatically. From financial issues . . .to capacity requirements. . . to compelling disaster recovery obligations. . .

Comdisco professionals are making the effort to keep you informed of the issues. To thousands of Comdisco customers, our name and our standard of quality service is second nature. To those of you who would like to learn more about the expanding scope of our services, as well as subscribe to our Comline Reports, we invite you to clip the coupon below.

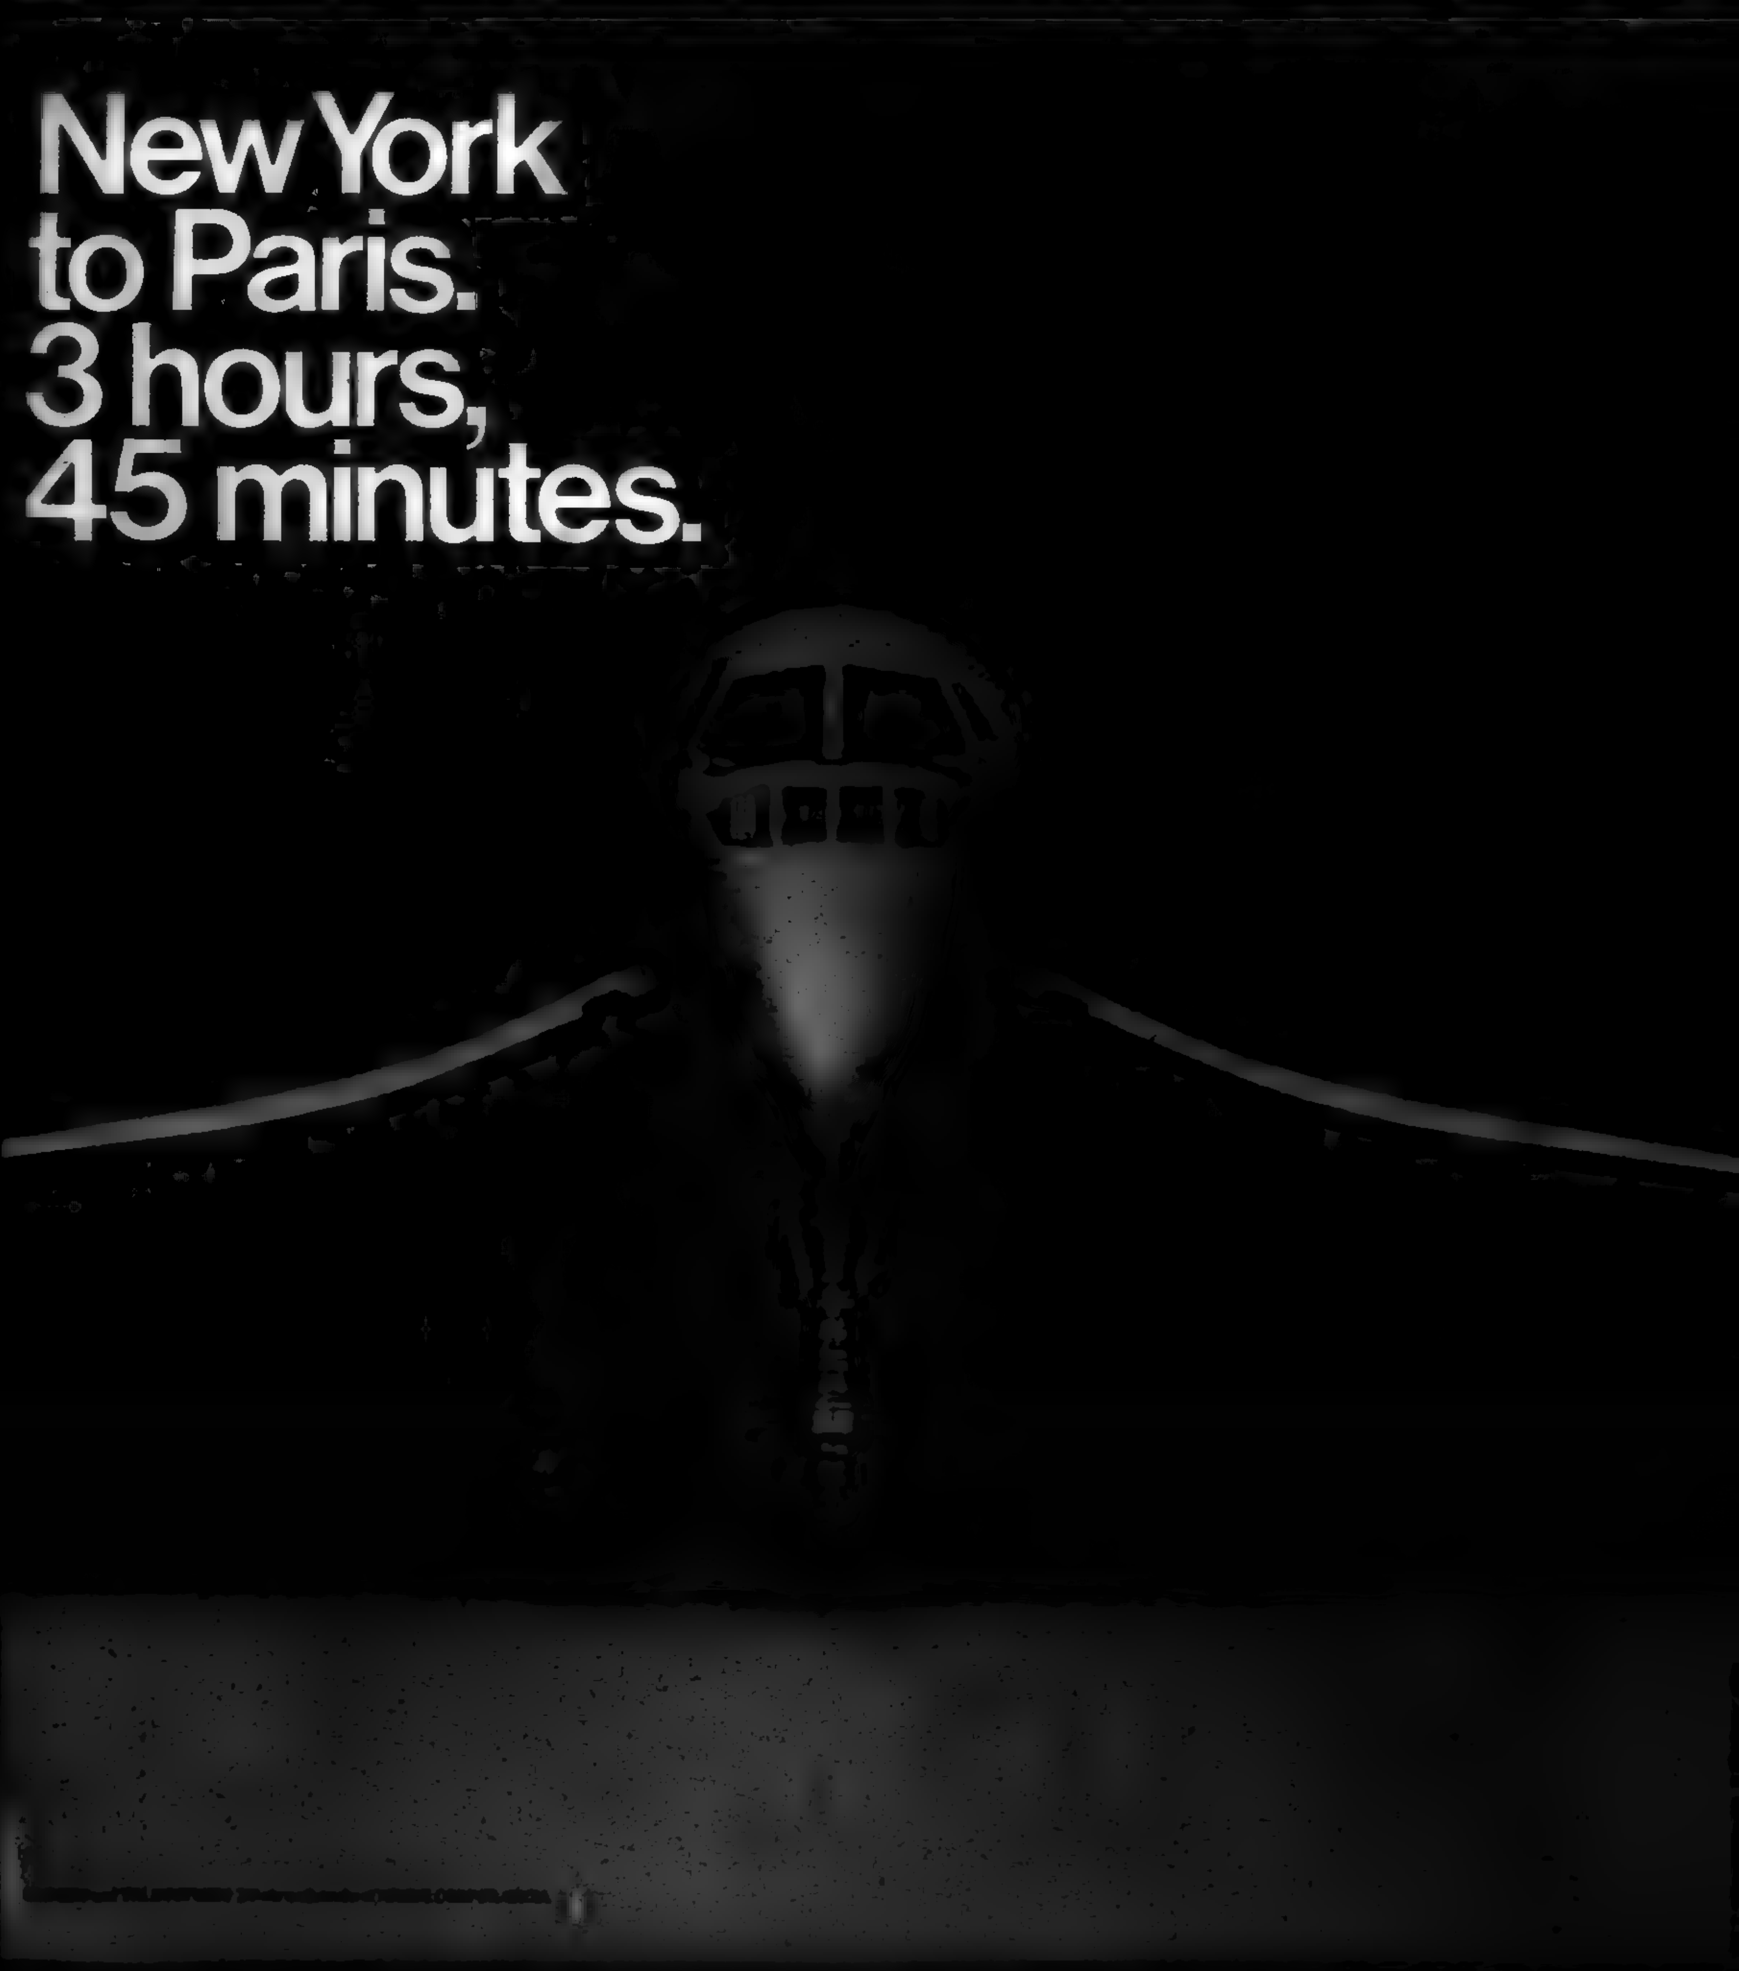
The carrier on the right is the Telecopier 295, a new high-speed facsimile just introduced by Xerox.

While it's not quite as flashy as the Concorde on the left, the technology is just as amazing.

Imagine a small, desktop digital facsimile that can transmit high resolution copies of your documents anywhere in the world in little more than the time it takes to fasten your seat belt.

But the Telecopier 295 is not only quick, it's less expensive to operate (with facsimile, faster is cheaper) and perfect for medium to high volume operations.

It's compatible with just about everything: the Xerox Telecopier family, most other facsimile terminals, and with the personal computer world as well, including



[illegible]

the computers and workstations that are part of Team Xerox.

With the G1/G2 analog compatibility option, it can communicate with other slower speed facsimile terminals. With the RS-232-C option, it can also convert and print ASCII encoded information from a vast array of computers.

But the most amazing thing about the Telecopier 295 is its price: about the cost of one round trip to Paris on the Concorde.

Now that's progress.

To learn more about the Telecopier 295, call 1-800-833-2323, ext. 44, or send your business card to Xerox Corporation, Dept. 44013, P.O. Box 24, Rochester, N.Y. 14692.

New York
to Paris.

patient registration, billing and receivable module; a communications and results reporting module; and a medical records module. Each module can be purchased separately, the vendor said.

Other software programs developed and marketed by Keane, including general ledger and budgeting, payroll and personnel applications, can be integrated with the HIS/36.

HIS/36 is priced at $43,000.

Keane, 420 Bedford St., Lexington, Mass. 02173.

■ Mobius Management Systems, Inc. has announced Release 3.0 of Infopac — The Output Management System, which provides for automatic distribution of computer-generated reports. The package runs in IBM DOS and MVS environments under CICS.

Release 3.0 features on-line report viewing and on-line definition of report distribution parameters to any output device. The on-line viewing system enables end users to go directly to the report, version and page they wish to view. Users can also choose the desired report or version from a system-maintained menu of stored reports. Users can perform character-string searches or can browse through the report. Both 80-char. and 132-char. screens are supported.

With the on-line viewing modules, users can selectively print part or all of a report. Printed output can be routed by the user locally to CICS printers, remotely to remote job output printers or centrally to high-speed impact or laser printers.

Prices for Release 3.0 of Infopac start at $12,500 for DOS and $22,500 for MVS.

Mobius Management Systems, 271 North Ave., New Rochelle, N.Y. 10801.

■ Software Design Associates, Inc. has announced a management information system for financial institutions with the IBM 4300 series mainframes running MVS.

The Risk Asset Management System (Rams) works in conjunction with Cullinet Software, Inc.'s IDMS data base management system. Rams can generate regulatory reports, reports on global customer and credit relationships, and it includes capabilities for monitoring adherence to credit policies. Rams extracts information from existing systems to build an integrated data base, a spokesman said.

Rams costs $500,000.

Software Design Associates, 71 Fifth Ave., New York, N.Y. 10003.

■ Polaris Systems, Inc. has announced the QDM + package for enhancing Hewlett-Packard Co.'s QDM/1000 Quality Decision Management software. Both packages run on HP 1000 minicomputers with the RTE-A operating system.

QDM/1000 is intended for use by manufacturing engineers to monitor and manage product quality. The QDM/1000 system collects numeric and descriptive data from the manufacturing environments and formats it for use in management applications.

QDM + enhances QDM/1000 by allowing a system manager to use full screen forms, soft keys and edits for data entry without programming, a spokesman said. Existing paper forms can be duplicated on the display, along with user-specific data collection cycles featuring single- or multiple-display forms.

QDM + costs $12,880.

Polaris Systems, 2339 Highway N. 34, Manasquan, N.J. 08736.

■ Datacamp Systems, Inc. has added query and spreadsheet modules to its Mirage utility system for IBM System/38 minicomputers.

Execquery38 gives users the ability to create reports from up to five files, the vendor said. Users can change sorting criteria and subtotals and specify which columns of data to print without having to rerun the data base interface.

Execsheet38 provides spreadsheet floating-point decimal capabilities, formula replication capabilities and a data base interface. Users can create bar, line and pie charts in both color and monochrome. A cut-and-paste feature allows users to create multiple graphs in one display, the vendor said.

Execsheet38 is priced at $3,495. Execquery costs $2,495.

Datacamp Systems, Suite 1, 2283 Dunwoody Crossing, Atlanta, Ga. 30338.

■ Burroughs Corp. has announced the Burroughs Advanced Manufacturing Control System (BAMCS) for its B5000, B6000, B7000 and A series mainframes.

BAMCS consists of five modules. The Business Foundation module lets users store, maintain, retrieve and utilize manufacturing data. The Business Planning, Scheduling and Shop Floor Control module lets users create production and purchasing schedules. The Customer Management module lets users record, manage and fill customer orders.

The Purchasing Management module provides capabilities for scheduling manufacturing material requirements. It allows users to select suppliers, manage purchase orders and keep track of inspected and purchased materials, the vendor said. The Financial Management module includes capabilities for tracking project costs.

BAMCS leases for $1;125/mo or $36,000 for a four-year license.

Burroughs, One Burroughs Place, Detroit, Mich. 48232.

See AIDS page 69

There are several ways
to simplify VM for your users...
and they're all called MULTIPAK/VM™

MULTIPAK/VM is a productivity aid designed by SKK, Inc. to enable your VM users to more easily perform daily tasks. MULTIPAK/VM is actually a collection of four seperate but related VM utilities that improve upon some existing facilities, while adding some powerful new capabilities for VM users under CMS.

MULTIPAK/VM was written to assist users at all levels of experience. The package offers a trove of features that will benefit the most experienced VM/CMS programmer as well as the non-technical, inexperienced VM user.

Here are just a few of the many ways that MULTIPAK/VM can help you:

1. SPOOL VIEWER
Spool Viewer gives users the ability to now display all spool files. This includes print and punch files, which were previously inaccessible. With Spool Viewer users are no longer limited by file size, because the entire spool file may be viewed regardless of size.

Spool Viewer offers user-tailorable screens, which may also be used to change the displayed data. The Display/Change feature enables users to change file attributes by simply keying-over the displayed data without using complex CMS commands.

2. SHORT CUT
Short Cut is a command shell which simplifies CMS by guiding users through a multilevel system of command panels. Short Cut is designed to reduce the CMS learning curve and to increase efficiency of experienced users by offering simpler, faster alternatives to existing facilities.

Managers may use Short Cut to restrict CMS command usage by specific groups of users or by individuals.

3. SCREEN PAINTER
Screen Painter enables users to construct full-screen application panels by laying out screens exactly as they are to appear. Screen Painter offers new levels of performance, while automatically validating all screens and allowing users to print screen hardcopies. These screens may be called from an assembler program, and EXEC, or a high-level language.

4. STRETCH EDIT
Stretch edit offers VM users new and enhanced XEDIT capabilities. MVS or VS1 datasets, or parts thereof, may be copied directly into CMS files without losing the current line displayed. Stretch Edit allows users to swap screens, rename files in one step, and enhance normal program function key usage.

5. FREE TRIAL
SKK can also give you a productive way to evaluate MULTIPAK/VM; a 30-day free trial. Simply mail in the completed coupon or call a MULTIPAK marketing representative at 312/635-1040.

What could be more productive? Your company...with MULTIPAK/VM.

from page 47

other vendors voice the merits of the dual-data base strategy. Which side is right?

The controversy can be traced to the very origins of the data base itself. Consider the world of master files, where every new application breeds its own set of master files, which usually are redundant. The promise of the data base as a single system of record was made, and soon master files disappeared from the scene.

A single system of record is one in which the content of data resides in its up-to-the-second value at the most detailed level. With a single system of record, the difficulties of master file redundancy and data synchronization are greatly minimized.

With a data base, which was touted as the be-all and end-all for users, there was no need for redundant data strewn all over the DP landscape. Thus, the early and intellectually appealing argument was made for the "truth" data base — the data base that served all data needs. Unquestionably, the truth data base approach was an appealing step in the right direction from the master file concept.

To this day, some data base management system vendors still make the claim that a single data base is the best approach.

But just as the world changed from master files to data bases, so has today's world changed from a single-data base concept to a multiple-use concept of data. The demands on today's data bases are many and varied — from the high-speed uses in bank teller and airline reservations data bases to the analytical needs of a vice-president of planning for decision support processing.

Evolution to dual data base

The next evolution from the truth data base approach is the dual-data base scenario. The primary division of data base processing is made along the lines of on-line, or operational, data bases, and decision support data bases.

On-line environments typically require a very structured kind of processing, while the uses of decision support data bases are unstructured. To use hardware to its fullest advantage requires the separation of structured and unstructured activities onto different processors.

Systems programmers have long known that IBM's CICS should not be mixed with TSO. Today's data base administrators are making a similar discovery. Cullinet Software, Inc.'s IDMS does not belong on the same machine as Information Builders, Inc.'s Focus.

To even the most die-hard relational advocate, it is apparent that the purpose and uses of decision support data are very different from those of operational data. Thus, the division into a dual-data base environment is a natural progression.

This assumes that there remains a single system of record, which nearly always is in the operational environment. Were there to be multiple systems of record, the advantage of going to data base from master files would be lost. But the dual-data base approach in no way mandates that there be multiple systems of record.

For decision support processing, there simply is no need to have up-to-the-second currentness of data or the level of detail found in the system of record. Thus it is that the dual-data base scenario represents the next step up in evolution.

The world is evolving into not only a physical separation of processors but also a physical separation of types of processors. For example, on-line operational systems are not just being physically separated from decision support systems, but operational systems are dominating the world of mainframes, and decision support systems are rapidly migrating to the micro environment.

An interesting issue is whether IBM has embarked on the dual-data base philosophy by accident or by design. Certainly, with DB2 and IMS Fast Path, IBM is clearly advocating the dual-data base approach. Cynics have suggested that IBM embarked upon that approach merely to protect its many customers that have billions of dollars of applications code tied to IMS.

While it is possible that IBM chose the path of expediency, in this case IBM has chosen the proper next step of evolution. Clearly, the next evolutionary step for the data base is the dual data base.

IT'S TIME TO STOP PUTTING BAND

■ Learned-Mahn, Inc. has announced the Automated Clearing House (ACH) Interface for automating contract disbursements in banking applications. The package runs with the company's Contract Collection Manager on the IBM Personal Computer family.

The ACH Interface is used to replace deposit tickets and cashier's checks, a spokesman said. The master record of the Contract Collection Manager, which automates third-party contract collection and disbursement services, contains disbursement instructions.

Using the ACH features, disbursements reportedly are written to an ACH file instead of writing a cashier's check and deposit tickets. The file is prepared in National ACH format, the standard for paperless transactions.

Licenses for the ACH Interface are priced at $4,000.

Learned-Mahn, 2229 W. State St., Boise, Idaho 83701.

■ Tasvir Corp. has announced a bidirectional utility program that transfers data between Computervision Corp.'s Cadds system and Tasvir's Supercads computer-aided design systems.

Superlink transfers models to Supercads where the model may be edited and sent back to the Computervision system while retaining the model's data structure, a spokesman said. Supercads is written in C language and gives users three-dimensional mechanical CAD capabilities. Supercads runs on Digital Equipment Corp.'s VAX systems, Apollo Computer, Inc.'s Domain workstation and the IBM Personal Computer AT.

Superlink sells for $3,000.

DSS

from page 47

age must be brought up quickly or users will lose interest in the fledgling system and revert to their old ways of making decisions, Wark said.

When selecting the capabilities needed in the DSS, managers should determine what it is they want to do most, Wark said. More importantly, he emphasized, they should be wary of vender claims.

"Vendors are going to try to get you to look at what is interesting to them." If your budget permits, consider adding advanced data presentation facilities, Wark said. "You'll use more of these facilities than you will some of the sophisticated statistic modeling capabilities," he said.

Selection criteria

As when choosing an applications package, management must first develop selection criteria based on required capabilities and then conduct a preliminary evaluation of DSS products, narrowing the candidates to about four products, Wark recommended.

Once the list has been culled, Wark advised MIS management to learn more about the DSS products either through seminars or discussions with users.

Bench mark studies are not always the best approach for comparing products, Wark cautioned. "There is not a good vender anywhere that does not know how to skew a bench mark."

As an option, companies should consider using products for a trial period. Wark suggested that companies convince the vendor they need a trial period.

Ease of use is one of the most important aspects of DSS, according to Wark. Users must be able to express their problems easily to the machine, and the most natural way of expressing those problems can vary from user to user. "For instance, APL [might] be a natural tool for an engineer to express a problem," he said.

Intelligent editors, query-by-example facilities and a language that allows users to take advantage of a relational data base management system are some of the capabilities that might help users present their problems, he said.

But success of the DSS implementation does not rely only on technology, according to Wark. The political environment at the company can be even more crucial to acceptance than trying to justify a product's price, he said. Managers must get user support first, he noted. "You have to have all your ducks in a row. If you don't line up your support ahead of time, all this is a wasted effort."

INTERVIEW

from page 47

people who've written 10,000 or 100,000 lines of code in a particular [fourth-generation language]. There are lots of problems with the so-called [fourth-generation languages]. None were developed according to modern ideas of language design. They all have GOTO [commands] and strange labels and archaic control structures.

Secondly, there are too many of them. With a standard language like Cobol, there is a whole market of tools available. If you want to compare two source code files or draw a picture of the control structure of the Cobol program, there are tools to do that. But if you have 100,000 lines of some [fourth-generation language] and you go out to find something to draw a picture of its control structure, you're likely to draw a blank. The vendor may not have gotten around to it, and it's not big enough for anyone else to get around to it,

This is a good argument for sticking to the language that has the most users. All surveys show Cobol holding its own. I would say more than half of all the code in the universe is Cobol.

I wrote a story on [fourth-generation language] cannibalism. They're [fourth-generation language vendors] buying each other up, and some are really hurting. There are too many out there. I hear stories in New York of companies trapped into hiring [fourth-generation language] consultants when they have substantial applications running in [fourth-generation language]. Modifying and keeping those applications running is a specialized task.

Q What are the maintenance implications of prototyping?

Prototyping is a buzzword that nobody has really thought through. Really, what you're saying in prototyping is that you're going to develop something very fast and then modify and adapt it. The implication of that is you get into maintenance a lot faster than you do with conventional development. The more prototyping you do, the better [you] know about maintenance because that's where you're going to be after day one.

Q Should maintenance programmers be paid more as a reflection of their real value within a DP shop?

It's up to the maintenance people to fight, not necessarily for more pay but [for] more responsibility. If a maintenance group is paying a company's bills much more than a rival development group [is, it] should state that case to management. Nobody [else] is going to do it.

Software is not going to go away. If we don't learn to control and modify it, it's out of our control. Our society is dependent on software. Our hope is to support people who are now doing or trying to do software maintenance.

Q Are most computer science graduates interested in development rather than maintenance?

Education in any technology always lags behind the real world. Since there were, at last count, only four college courses in software maintenance in the entire U.S., it's very unlikely that anyone is going to come out of college knowing about maintenance. You have to learn it on the job.

Q Why are so few courses offered?

I think it's because professors don't have to deal with large systems that already exist.

The average textbook is about how to write a little routine to do sorting. Every semester the professor sees 35 more students write yet another sorting routine.

Q Why aren't programmers interested in maintenance?

It's hard to go into a job and find it [to be] something you never heard of in your education. A demotivating factor is that many shops still approach maintenance with a philosophy and technology that are not adequate.

Maintenance has been regarded as something people do in three-day or one-week projects, more or less without tools. But some modification tasks are between the quick fix and the 50-person-year development project. Most organizations have no place to put projects like that.

Q Are vendors guilty of overemphasizing products for development rather than maintenance?

There is an elite group of vendors who understand maintenance, but vendors in general are hopelessly backward in this area. It's easier to write a tool that generates code according to some idea you have of how code ought to be generated.

There are probably 1,001 generators of fourth-generation languages. Every one is slightly different, and every one is a map of the brain of the company that produced it. It's easy to do that. What's difficult is to look at a system that exists and adapt yourself to it.

The vendors in the software maintenance environment tend to boast a whole lot less. . . . They don't try to sell you the total solution.

Q What's the state of the art in tools?

The state of the practice is that there are excellent tools for specific problems. There has been a lot of talk about putting the tools together in one consistent workbench. I'm skeptical about this. It's not clear that what's keeping people from using tools is not having the one workbench. Second, it's a lot harder to put these tools together than it appears. The interesting commercial opportunity I see is to combine 15 tools and put them together in a joint marketing effort: A tool bench of other people's tools.

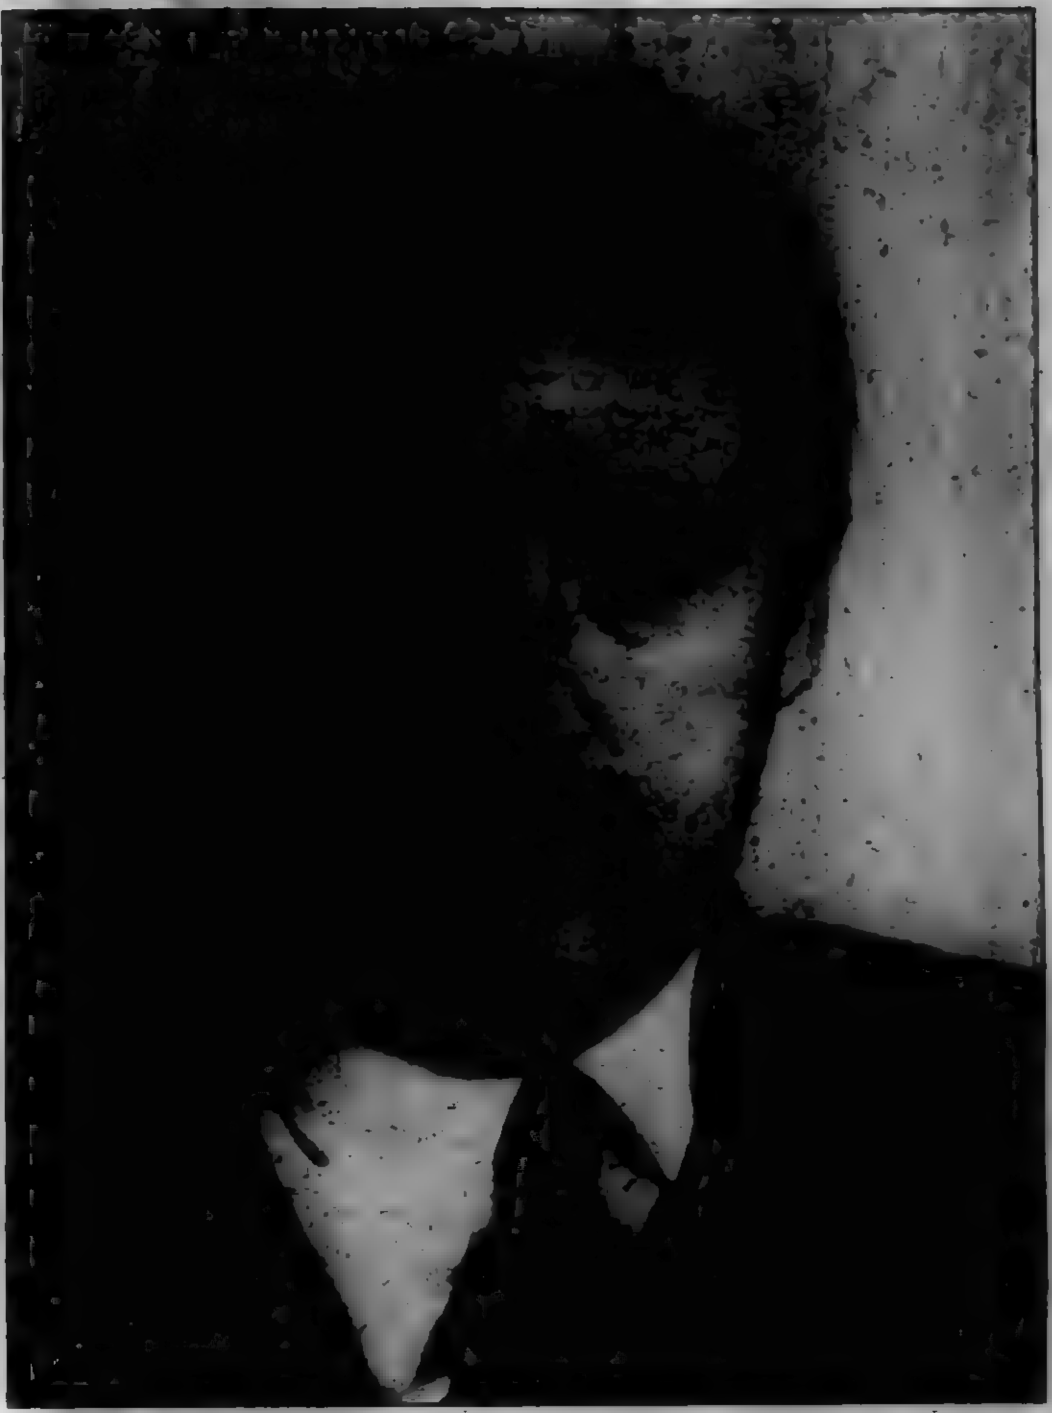
On the Information Center Strategy

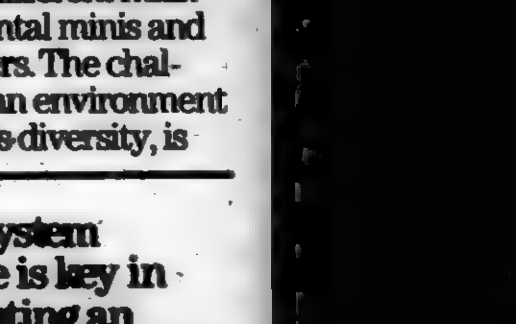


Today, virtually every IBM mainframe user is attempting to implement an information center. Formulating a successful information system strategy for the 80's and 90's requires it.

However, one of the major problems many companies face is the variety of software and databases located on different mainframes, departmental minis and personal computers. The challenge is to create an environment that integrates this diversity, is responsive to the corporate user community in meeting its information needs and, most importantly, provides access that is consistent and transparent. This is why open system architecture is key in implementing an information center strategy.

> "Open system architecture is key in implementing an information center strategy."

It also makes particular sense for a software company like Cullinet to adopt a policy of open system architecture that allows corporations to standardize on Cullinet's products without losing a significant investment in other vendors' products—whether they are mainframe applications, microcomputer software such as Lotus 1-2-3, Symphony and other PC products or departmental minis from companies like Digital, Data General, Wang, Hewlett-Packard and others.



That's why Cullinet has introduced the Information Center Management System. It's one part of a strategy that makes it much easier for the VP of Information Systems to standardize on the full range of Cullinet software, including our proven mainframe database and applications and our integrated GOLDENGATE microcomputer software.

Our strategy makes sense not only because Cullinet products are designed to work together, now and in the future; but also because our open system architecture means that data processing management will be able to accommodate satisfied users of other software while anticipating the introduction of new products.

For more information about the Information Center Management System and the full range of Cullinet products, I encourage you to phone, toll-free, 1-800-225-9930. In Massachusetts, the number is 617-329-7700.

IBM, DEC, Wang and DG are registered trademarks of International Business Machines Corporation, Digital Equipment Corporation, Wang Laboratories, Inc., and Data General Corporation respectively. 1-2-3 and Symphony are trademarks of Lotus Development Corporation. GOLDENGATE is a trademark of Cullinet Software, Inc.

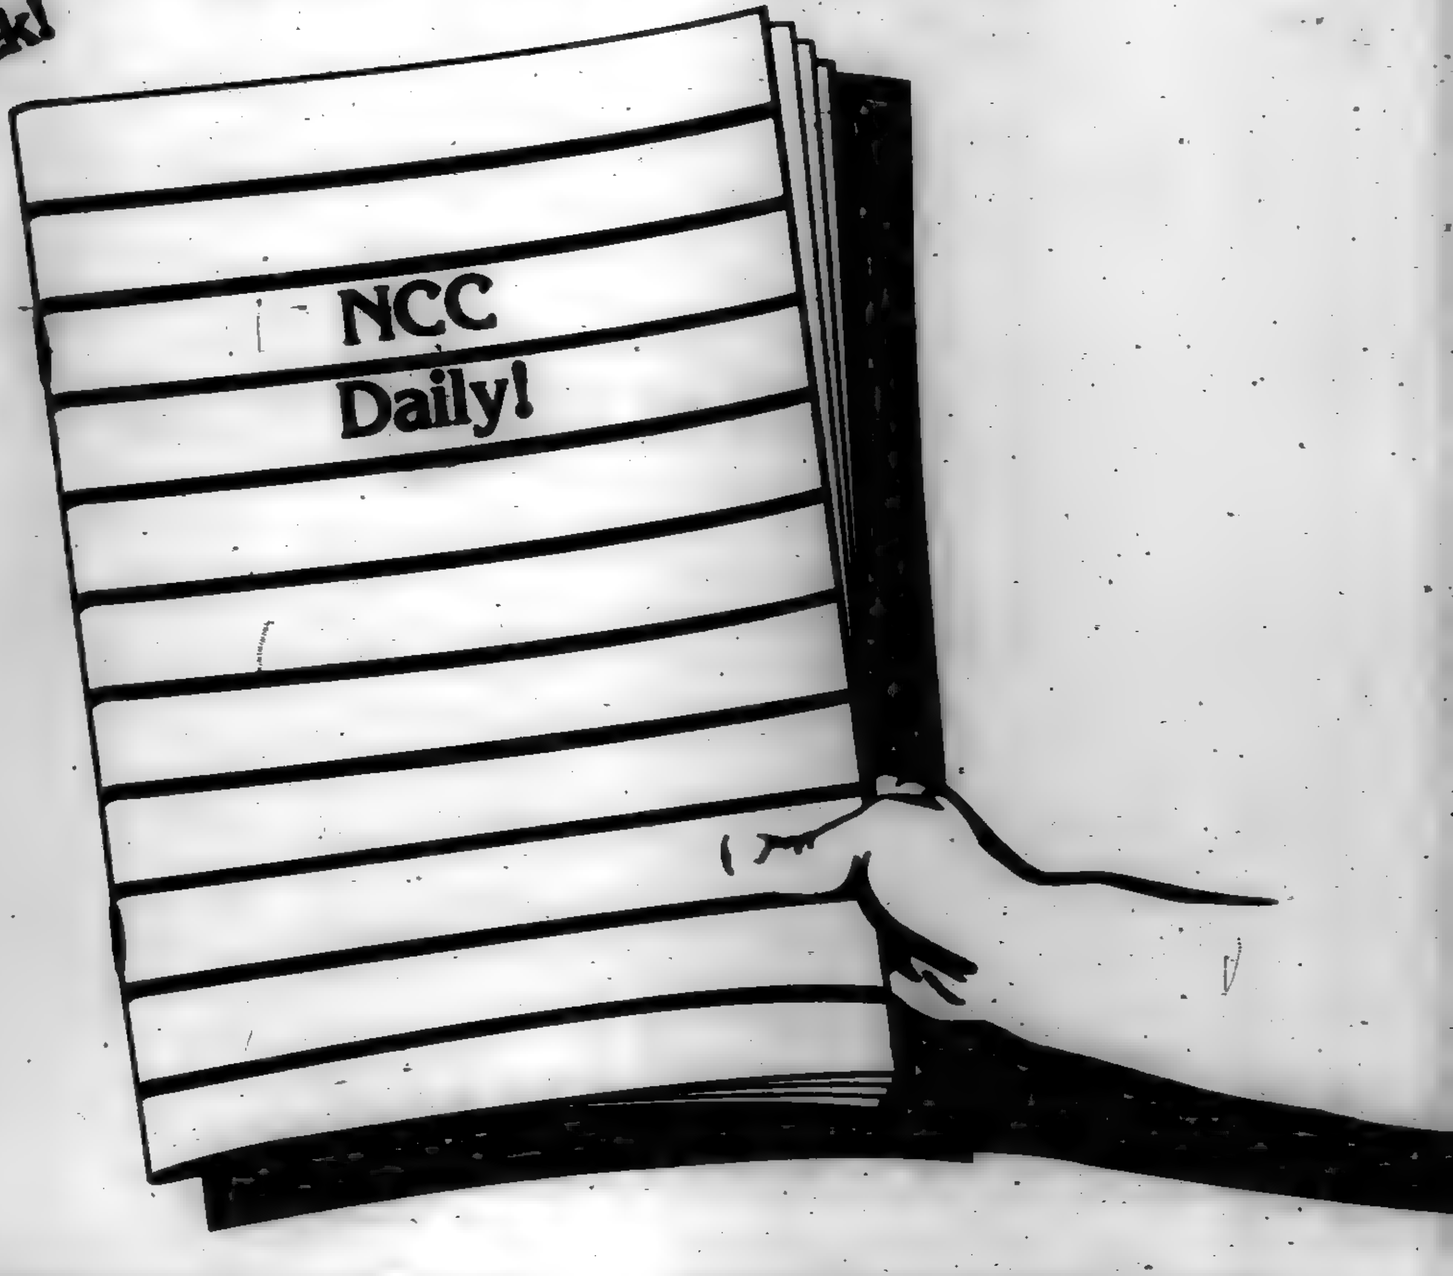
Announcing the NCC tour guide

Act now. Closing this week!



The National Computer Conference (in Chicago this July 15-18) is so big, attendees need a guide to the show. Something like a tour guide. To make sure they see everything they came to see.

And because NCC is so big, you need to tell your customers and potential clients how to find your booth. To make sure that you get a good return on your investment.

Computerworld will be at NCC with help for the attendees and the exhibitors. We'll publish four separate issues of the always popular *NCC Daily!* And we'll distribute 25,000 copies each morning of the show. So your ad will reach your target audience just as they're deciding which booths to visit.

Each issue is sure to be well read. We'll provide attendees with on-the-spot coverage of the major product announcements, speeches, and technical programs. Interviews with top industry personalities. A schedule of events for the day of issue *and* the next day. Plus a guide by local experts to Chicago's restaurants, museums, and entertainment.

We'll also cover NCC in three special issues of Computerworld. The July 8th Preview issue. The July 15th Show issue. And the July 22nd Wrap-Up issue. Advertise in these issues and ensure your investment in NCC. And, just as importantly, you'll keep your name in front of more than 687,000 computer-involved professionals all during this eventful period.

Space is limited in the *NCC Daily!* Ads will be accepted on a first come, first served basis. So reserve space for your ads today. Call your local sales representative. Or call Ed Marecki, Vice President of Sales, at (617) 879-0700.

Issue	Issues Dates	Closing Date
NCC Daily!	July 15, 16, 17, 18	June 10 (all 4 issues)
NCC Preview	July 8	June 21
NCC Show	July 15	June 28
NCC Wrap-up	July 22	July 5

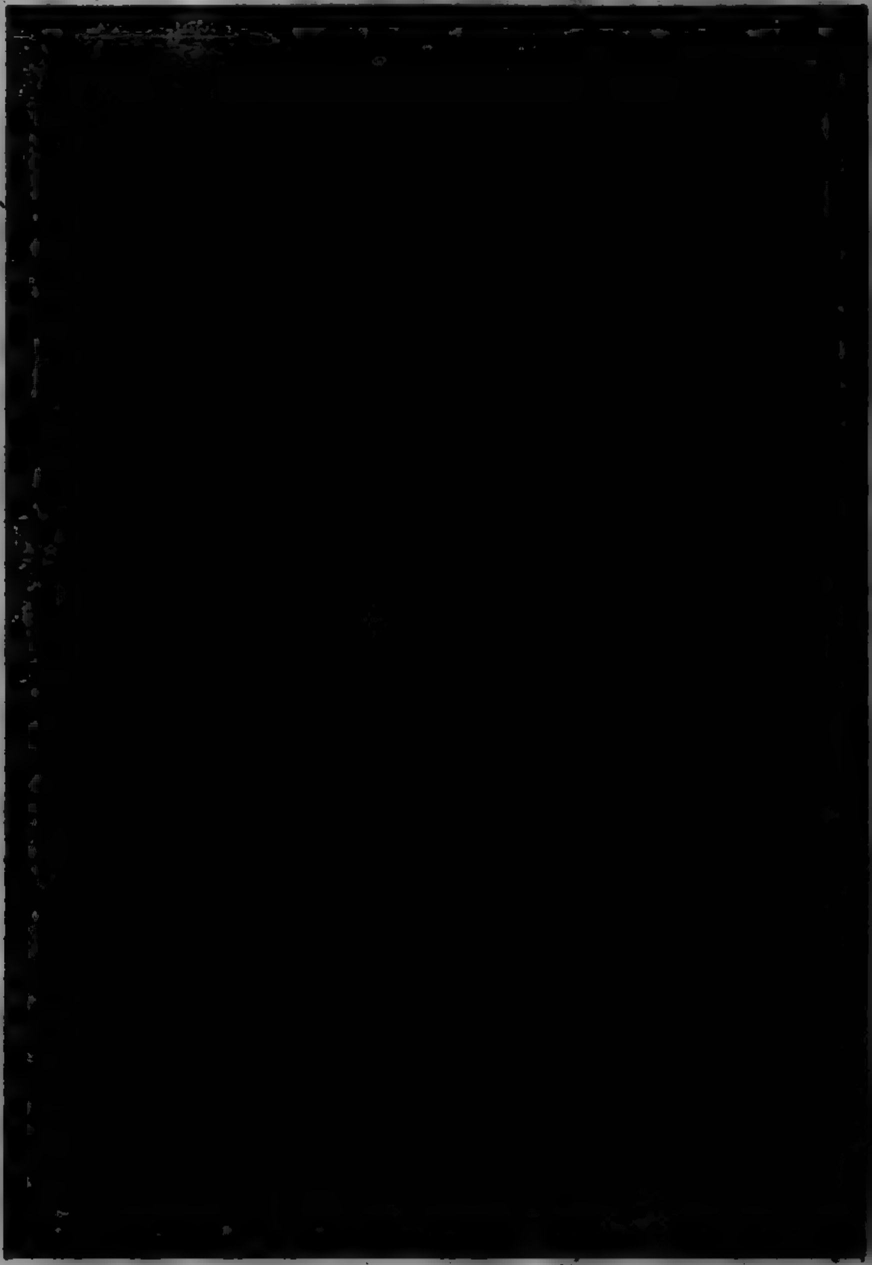
IN DEPTH

PHOTOS © [illegible]



"It's going to be a good long time before they start seeing substantial results from this investment."

"MCC really is an effort to keep midsize companies independent and still able to play in the game."

MCC revisited

An interview with Bobby Inman

Retired Adm. B. R. Inman is president and chief executive officer of the Microelectronics and Computer Technology Corp. (MCC). This venture, begun in January 1983, is attempting to turn competitors into partners during the research and development stage of products. Inman, who will be the keynote speaker at the National Computer Conference in Chicago July 15, was interviewed by staff writer Clinton Wilder at MCC's headquarters in Austin, Texas.

When the idea for MCC was hatched, some questioned whether companies that compete against each other could work together successfully here. How has the cooperation evolved?

The key decision in the success of MCC, in defining the research programs, was that if the teams defining the programs could envision a product, the research should not go to MCC. What that means is that companies do not have to transfer in technology that they are now using for competitive advantage in the marketplace. That was probably the critical element in getting these diverse companies to work together. If you were looking at near-term things, and there was a question of somebody transferring in technology that might make a difference in three or six months of getting their product out, I don't know how that would have evolved.

Now that the principle is in place and the legislative action has settled the antitrust issue, then you will see some joint ventures for the near term created along the way. They're not likely to be as broadly based as the long-term ones, but you will see some with problems three to five years out being handled.

There was a lot written about how, for a while, you weren't satisfied with the talent levels of the researchers. Has that changed?

I am delighted with the talent that's here now. But I did not believe that a lot of the people I saw as candidates were of the quality that I needed. The board of directors has ultimately been very supportive of the approach we've taken, even if there were some early concerns about talent. But as I've noted, once it got started, it took off like a rocket. We got really superb talent, and that serves as a magnet.

In early 1983, the original concept was that all the talent we needed was to be found in the companies; it was just a question of getting it. The actual execution has turned out to be very different.

Lately, we have been blessed by a flood of resumes from people who want to be part of MCC. When you stand back and ask why they want to be part of MCC — it's because of our long-term goals and tough problems, problems where they think they could make a difference. That is what has drawn people, even in the companies. We have had a couple of direct hires who were in the companies, wanted to get assigned to MCC and didn't. They resigned, and then we hired them directly.

With 21 different companies out there, I presume there are differences in the significance each member attaches to MCC.

Well, it cuts two ways. First, this is an organization that was created from the top down. The chief executive officers and a group of senior people around them made the decision on whether the company would join. When you get into execution, and you get down three or four ladders, you have all of the situations that one should expect.

There are people who see it as competitive. They'd rather use the dollars on their near-term problems than on something long range that they don't know will ever benefit them. When it gets down several levels and they have to decide who to break loose to send, it is absolutely normal that they would be reluctant to send their very best person working on this year's problem, out of whose performance their whole bonus might be calculated. It's the kind of structure where, to get started, you need senior attention.

MCC was initially envisioned as something where all the researchers, including the research program directors, were going to come from the companies. How have they taken the change to 88% direct hire and all the program directors coming from outside? Has this process led to major misconceptions about the attractiveness of MCC to the companies' researchers?

Perhaps. But again, it was a learning curve. There was an assumption made about where talent was to be found, and none of them ever envisioned that MCC was going to be attractive to so many people who were not in the companies. But the companies have remained very flexible to adapt to the realities of MCC.

I had some advantages. I came from 10 years of managing organizations where I had to get people to work together who didn't necessarily want to but had to. Understanding how you go about that and how that process works was not in [the companies'] experience.

If the success of MCC is gauged by how effectively your research advances are translated into products back at the company level, how is that going to work?

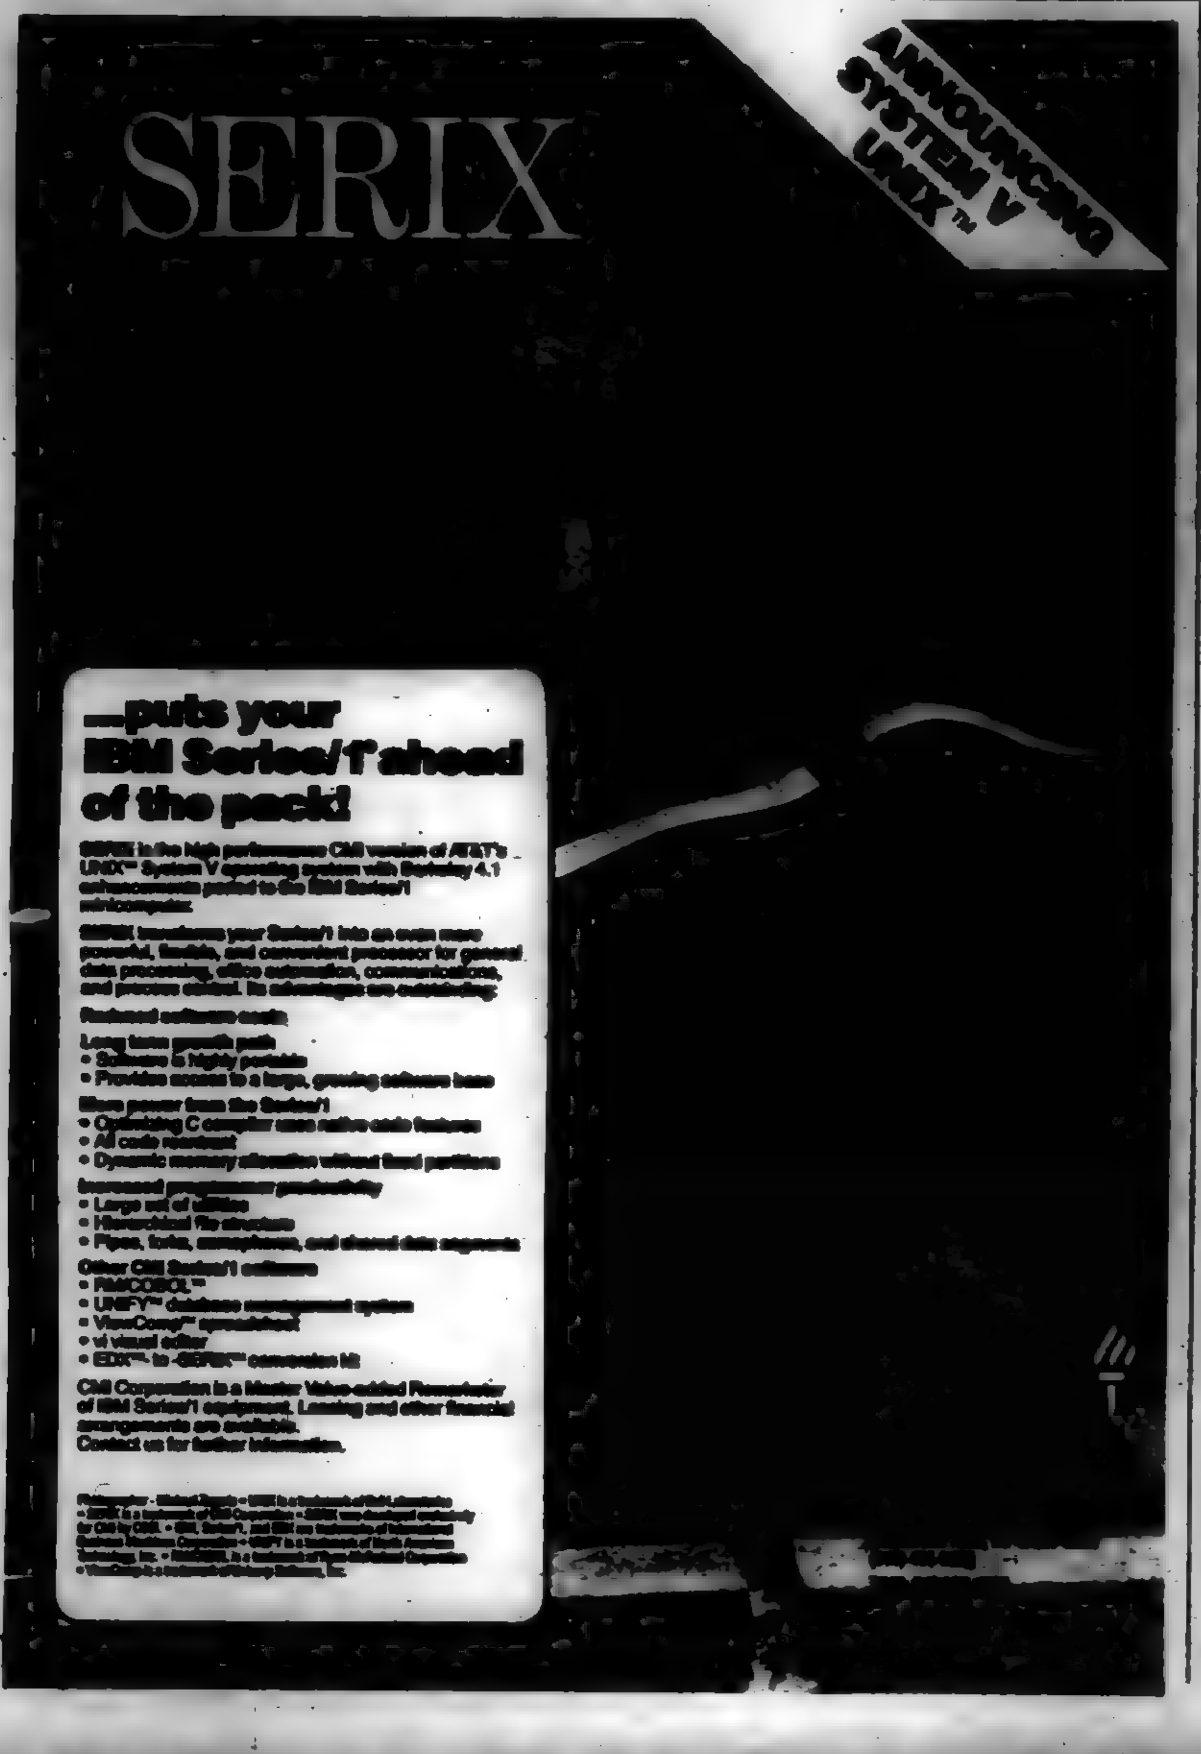
Technology transfer, internally, is a very tough thing to bring off. It doesn't just happen with the wave of a wand. People at the companies initially said, "don't worry about it, we're going to send people on assignment, we'll send liaisons that will rotate and bring the technology back with them." But with 88% direct hire, they aren't going to go back. Over time, the companies are going to have to have their own internal tracking organizations, and they're going to have more of their people come and spend extended periods of time here for hands-on understanding of where we are.

We'll end up with more people here on a temporary basis, as we get closer to the licensing. We're already seeing some companies sending teams — happily with some from the production side — to get them to begin to think about what may come out of here. That's a very good sign.

The 21 companies are very diverse, and that says as you're trying to make decisions, you have to work harder. But if you look at it from a different angle, the likelihood that several of those companies will end up using the technology that has been created is very high. And for what's going to motivate the researchers, it's knowing that what they produce gets used.

So as I look at the diversity and say, oh God, how long is it going to take to get the necessary vote through, I remember that for what's really going to motivate the scientists — the prospect that their technology is going to get used — that very diversity is a strong plus.

How big a role can MCC play once the technology transfer is accomplished?



ANNOUNCING SYSTEM V UNIX™

SERIX

...puts your IBM Series/1® ahead of the pack!

SERIX is the high performance CMI version of AT&T's UNIX™ System V operating system with Berkeley 4.1 enhancements ported to the IBM Series/1 minicomputer.

SERIX transforms your Series/1 into an even more powerful, flexible, and convenient processor for general data processing, office automation, communications, and process control. Its advantages are outstanding:

Reduced software costs

Long term growth path
- Software is highly portable
- Provides access to a large, growing software base

More power from the Series/1
- Optimizing C compiler uses native code features
- All code reentrant
- Dynamic memory allocation without fixed partitions

Increased programmer productivity
- Large set of utilities
- Hierarchical file structure
- Pipes, forks, semaphores, and shared data segments

Other CMI Series/1 software
- RM/COBOL™
- UNIFY™ database management system
- ViewComp™ spreadsheet
- vi visual editor
- EDX™-to-SERIX™ conversion kit

CMI Corporation is a Master Value-added Remarketer of IBM Series/1 equipment. Leasing and other financial arrangements are available.
Contact us for further information.

"

How are you ever going to get U.S. corporations to think long-term when the media is saying, 'What did you do last week?'

We play no role. And therein is where the antitrust laws get involved. The National Cooperative Research Act of 1984 is very clear that manufacturing and marketing products are excluded from the protection provided to joint ventures.

So we will create the technology, we will stream it out to the companies that have funded it and put together the necessary elements for that technology to be turned into products, and we'll say, "License it." We will support that technology for six months, but after that, we're out of it. So we're really supporting it well into the design phase, but not the manufacturing and marketing.

Has MCC come up with any technology so far that you have been able to license?

These are very long-range programs, with deliverables years out. But it's turned out that there are some proprietary approaches that we've taken in-house — the way we are attacking problems, a unique equipment configuration that we've put together or algorithms used in attacking software approaches — that the companies have looked at and said, "Gee, we can use that on our own research activities. We'd like to pull that now." The answer is, we will do it, but we won't support it in that case. We can't afford at this stage to send people off to maintain the techniques that we're using.

Are these the early deliverables we've heard about?

Yes.

So it's really your methodology of doing the research that has produced something to transfer back to the members.

As we've gotten through the planning stage and into the research itself, and with the teams that have been assembled, the uniqueness of the methodology has been a product in itself. It was simply a product, an outcome, that we had not anticipated. It's nice to have some of those because, unless we have fortuitous, unforeseen breakthroughs, it's going to be a good long time before they start seeing substantial results from this investment.

Does it get frustrating to have to keep telling outsiders that you're not going to be turning something wonderful out of here in, say, two years?

Yes, every now and then, my frustration level gets high. A great newspaper on the West Coast that I've admired all my life drew my ire last October with an editorial that said, "Gee, MCC has been in business 18 months, and they haven't produced anything in artificial intelligence and neither have the Japanese, so it's clearly a bad idea." I mean, that's a 10-year program. Now if 10 years from now we haven't produced anything that's usable, then that's a good [comment]. How are you ever going to get U.S. corporations to think long-term when the media is saying, "What did you do last week?"

Looking at the programs we have now, in five of them, you can already envision the kinds of things you can do and the directions they will go within the time frames. The two that are somewhat more problematic are AI and parallel processing. There, all the theory hasn't been developed. So some of the things we're doing are really just basic research. So it may turn out that the 10-year time line is too close. There will be things we'll learn in both those programs that will impact the next generation of computer designs. But it may turn out not to be as significant as in the other programs.

It must be frustrating to turn the technology out here and then have to sit around waiting for it to be used.

I worry about this topic a lot, and some of my shareholders tell me I worry about it too much and too loudly. But I'm confident because the members know that other companies will have access, that they will try, and they will plan to use this at a fast clip.

We've been hard at work now for more than a year on the mechanics of a master technology transfer plan, getting all the licensing arrangements in place, so at least we aren't going to have bottlenecks in the process from this end that slow down the availability.

Even if it means we'll have difficulty later in proving it was our idea that started it — that's a conscious risk that I hope we won't have to confront. But what we've worked on is that there are no impediments from the MCC side in the lack of flow to those that paid for it. This is not a laboratory simply creating ideas to publish and stop.

Turning to Japan — how much of an eye are you keeping on them?

To be very direct, I'm keeping almost no eye on them. It's primarily all the questions I get asked from the media that cause me to spend some time tracking [Japan]. It has no influence on research. Now if they were to suddenly have a great breakthrough, we would clearly scramble

to say, "Where are we? Did we try that? If not, why not?"

But short of that, first, there isn't a flow of information that gives you great detail on approaches the Japanese have taken. If [Nippon Telephone & Telegraph] would like to make very clear what it is doing and how it's doing it, my attention level would go up very quickly. But for the rest, I simply track reports I see and get reports back from people who've attended a conference there.

> ”
>
> *I have great respect for the Japanese. I expect they will turn out some very usable products, and they have a shot at creating new technologies before they appear in the U.S.*

I have great respect for the Japanese. I expect that they will turn out some very usable products, and they have a shot at creating new technologies before they appear in the U.S. But I don't have a great sense that we are, at this point, behind in creating the technology. Where my worry lies is in the implementation.

If you look at the history of the last 15 years, where the Japanese have made their great advances has been at the speed with which they take their new technology to marketplace . . . in quality control, manufacturing, the skill in the market. So we could end up producing technology two years before the fifth-generation effort, and that could end up making little difference in the competitive marketplace, unless the U.S. firms can move the technology to marketplace at a faster rate than they have in the past.

What are your thoughts on trade barriers?

I'm opposed, instinctively. As I look back over history, whenever we've turned to them, results have been disastrous over the long term. The way you avoid those is by the speed with which you introduce the new technology.

If you ask me what in the country worries me like that, I worry that I don't see more focus on manufacturing technology. We're not really doing anything at all. I see a lot going on inside General Motors, General Electric — I presume it's going on inside IBM, but I don't see it in small and midsize companies.

I really worry about whether we are doing enough in this country to bring emerging technologies to bear, on modernizing basic industries to make them more competitive and productive.

How much does your own background help?

Almost none. I am an analyst of the Soviet Navy and Soviet government, things like that, not on Japanese technical matters, so I have little to offer them in that case. My experience was in electronic surveillance, and we're not engaged in that now, nor is there any possibility we would be. So my background turns out to be not that relevant.

Is IBM seen as a threat in the specific research areas MCC is pursuing?

A competitor, not a threat. I would expect they have very viable efforts going in all of these areas. Does MCC have any advantages in that competition? The answer is yes. We have advantages for the scientists who would prefer to work in a small organization, with a higher prospect that their specific contributions will be very visible.

IBM has existed for many years, and no one ever came together in response to it being there. Obviously, if MCC ends up making some of [the member companies] more economically viable, it also makes some of them more viable with regard to IBM. But I doubt that Boeing, Martin Marietta, Rockwell, Lockheed, Kodak or Bellcore, for that matter, are giving much thought to what IBM is doing.

Clearly, some of our shareholders will be vitally impacted by what IBM does at the marketplace, both in products and tactics. But for some of the others, their only interest is whether IBM is going be purchasing their equipment.

But what about IBM's $4 billion R&D budget?

It's enormous. It's like another element of the federal budget, as is General Motors'. That has been our history, that as an industry matured and the cost of R&D became very high, you only had a few giant corporations because everybody else fell out. MCC really is an effort to keep middle-sized companies independent and still able to play in the game. That's what is going to be interesting to see.

There have been some indications that you may start a new research program. What is the status of that?

It's still in the formative stage. Originally, the board thought we should not contemplate any additional programs before 1986. But by last fall that changed, and there was no longer any doubt that MCC worked, so we accelerated the process of looking at some additional programs. We've done that, starting in March, but it's not proceeding as fast as I thought earlier. It takes a lot of hard work to lay out the specifics of a program that people would actually want to be a part of and invest a

R Office

Getting spreadsheets, word processing, graphics, communications and the IBM PC to work together can be tough, too.

If you think solving the federal budget deficit poses a challenge, you haven't tried getting a company's personal computers under control.

When you do, you'll find that most users require different configurations to handle their various computing needs. And while there are plenty of hardware and software products that perform well, they don't necessarily perform together.

Enter DunsPlus. A combination PC product and service that brings a new level of integration and cooperation to the IBM PC, software, communications, user education and services.

DunsPlus offers you the choice of any IBM PC, already configured with proven software programs like 1-2-3 and MultiMate or DisplayWrite word processing. It also includes software tools for data integration, file management, micro/mainframe communications, and systems development.

Unlike static integrated products, DunsPlus has the flexibility you need to add software to its consistent, easy-to-use, menu-driven operating environment.

And it's backed up with comprehensive education programs and support services.

DunsPlus. Like NOMAD, now NOMAD2, the premier 4GL/DBMS, it's one in a continual evolution of computer software services from Dun & Bradstreet.

To assure that your PC products work together, write DunsPlus, 187 Danbury Road, Wilton, CT 06897 or call 800-DNB-PLUS.

DunsPlus

We make PC products work the way they should. Together.

DunsPlus

> *We're a little ahead of the most optimistic hopes. There's no longer any doubt that diverse, competing companies can pool talent to attack long-term problems.*

substantial amount of money in, particularly in a time of economic downturn.

Has the relationship between MCC officers and shareholders executives changed?

It was clearly the intent of the shareholders that they be directed by a CEO and principal officers here, not by committees of shareholders. I am very quick to ensure that we have no erosion of that.

What about keeping research information proprietary for the companies that funded it?

That is an area where my past experience is relevant. In all my National Security Agency years, the key was to get scientists to exchange ideas and attack very tough problems. And then you compartmented the actual application for national security reasons.

Here you do it for proprietary reasons. So I know that the process can be made to work.

In terms of your original expectations for MCC, what is your assessment at this point? Is there any reason to doubt the high hopes?

I would say we're a little ahead of the most optimistic hopes. There's no longer any doubt that diverse, competing companies can pool talent to attack long-term problems.

You can build the teams, the funding profile works, ideas are going to tumble out.

What we clearly haven't established and won't for several years is that which turns out to be technology that gives an edge in the marketplace. But for the totality of the concept of joint venturing for creating that technology, there is no longer any doubt about that at all. It is a process that works.

The record will not be complete, though. The concept wasn't just to prove you can do joint research, but was this approach going to give us a competitive edge in the marketplace? And that is where the jury is still out.

Can you envision an MCC without Bobby Inman?

Oh, sure, very easily. You could have a number of other MCCs.

I brought some experience that was relevant in getting started, but you've already got a half-dozen people around here who could go run an MCC.

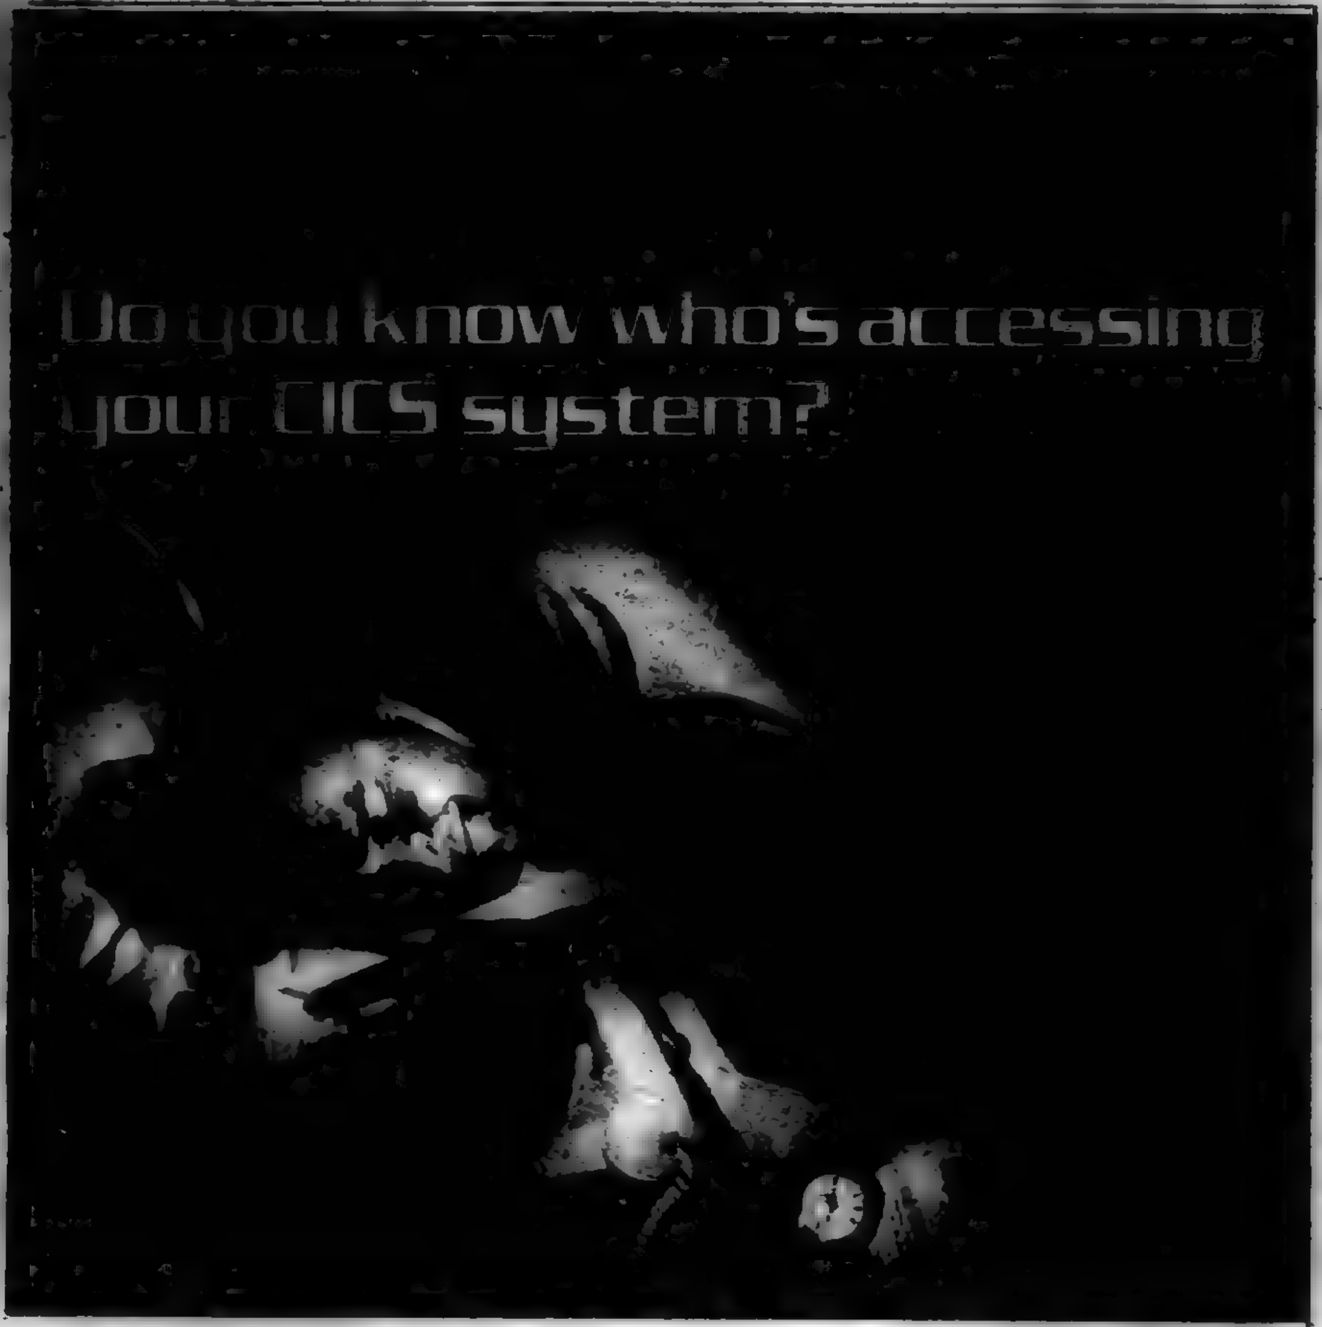
I'm not looking for someone to come replace me at this point. It's still in the building stage, there are new things that come along all the time, and that's what's exciting and fun about it. Whether it will be the same way five years out, well, I don't know.

But I was very careful from the outset to structure an organization that was not dependent on me. I made a mistake 10 years ago, when I was the director of Naval Intelligence, in having everybody report directly to me, and I made the decisions. I loved it, but it was awful, because I suddenly got pulled out of the job and promoted.

And I learned the very painful lesson that you don't structure an organization to be dependent on a single individual.

My real key here was to prove that the concept could work. That is behind us. Now the goal is to evolve it into a healthy, long-term organization, introducing some additional programs, getting through some actual technology transfer processes where the companies pick up the research.

These are still real challenges.



Do you know who's accessing your CICS system?

ALERT/CICS™ customers can rest easy. They *know* that ALERT/CICS is not only easy to use, but is also a comprehensive CICS security system.

With ALERT/CICS each authorized user is only permitted to access the transactions, programs, files, and fields within maps that were defined for that user. Terminal security is also available for each of these access levels.

ALERT/CICS customers also love its modular design. They can turn on as much or as little security as they want. This makes it easy for them to "phase in" ALERT/CICS's security.

But what really makes ALERT/CICS great is that it's completely menu-driven. ALERT/CICS customers do not have to learn a rules language. They simply fill in the blanks of the security screens.

So if you're uncertain about the security of your CICS system, call us today at [illegible] to find out more about ALERT/CICS. And start resting easy!

The MCC payoff

Getting the technology back home

By Clinton Wilder
CW Staff Writer

Technology transfer.

It's a buzzword heard often in the offices and research rooms at Microelectronics and Computer Corp. (MCC), appropriately located on Research Boulevard on the edge of fast-growing Austin, Texas. Loosely defined, it means the process by which the 21 computer, electronics, aerospace and other companies that own MCC hope eventually to convert the research done there into proprietary products back home.

MCC's long-range research goals, such as fifth-generation computer advances, have met with both praise and skepticism in the U.S. computer industry. But for 21 firms investing substantial amounts of research and development money in the ambitious project, the jury on MCC is still out — and will be for the next several years. The member companies will judge the success of MCC not by what is accomplished in Austin, but by how quickly and how well those accomplishments become products that enhance the members'

Scheduled to open in mid-1986 is MCC's permanent office and research headquarters, a 200,000-square foot building leased from the University of Texas.

competitiveness with the Japanese and each other.

"At Honeywell, we have a saying that nothing happens until somebody sells something," says Richard Hill, a Honeywell, Inc. MCC liaison working in the artificial intelligence component of MCC's Advanced Computer Architecture (ACA) research program. "Well, nothing happens at MCC until the technology gets transferred. It's a live or die issue."

"Any company that doesn't prepare for that technology transfer back home is a loser," Control Data Corp. liaison Ellen Boughter says bluntly. "They would lose their whole investment."

> ”
>
> *Today, a share goes for $1 million, and some of the programs, including the highest funded ACA program, have also increased the price of participation.*

By the standard financial measure of investment value, MCC has progressed quite well since its 1982 conception as the American answer to the Japanese Institute for New Generation Computer Technology (Icot) research effort. In 1983, MCC set up shop with the 10 charter members becoming shareholders for $150,000, plus their investments in at least one of the four research programs.

Today, a share goes for $1 million, and some of the programs, including the highest funded ACA program, have also increased the price of participation. Having added 11 new members and 13 peripherally involved associate members, MCC has seen its annual budget grow from $35 million in 1983 to an estimated $65 million this year.

By other standards as well, MCC has made significant strides since a rough start. Because MCC's newsmaking chairman and chief executive officer, retired Admiral Bobby R. Inman, began looking outside for researchers, most programs have begun to take off, the members say. Company liaisons believe MCC's transition from 100% shareholder employees to just 40% was an inevitable growing pain.

"The idea that members weren't sending their best people to work at MCC was a naive criticism," Hill says. "The people [candidates that Inman refused] were very good at what they do; it's just that they don't do this kind of thing. We quickly came to the realization that to do the 10-year perspective kind of research that MCC was formed to do, you needed a whole different breed of cat."

In the Software Technology program, for example, Inman deliberately held back the entire project until he found the right program director from outside — Laszlo Belady, a 23-year IBM veteran most recently in charge of software at Big Blue's Japan Science Institute. "He exercised his veto power to turn away people who didn't measure up," says Sperry Corp. MCC liaison Arthur Schneider. "The whole cadre of technical people there now is absolutely first class."

New identity

The result is a different identity for MCC, one that officers and participants say is greater than the sum of its parts. "When people come down here to work from the companies now, they hang their corporate IDs on the back of the door and become MCC employees," says George D. Black, MCC vice-president of Human Resources. "We've seen a remarkable difference in the last year in the number and quality of people who want to be part of MCC. People come because they want to be part of a whole new way of doing business in this country."

Part of that mind-set is MCC's emphatic commitment to the future. While the computer industry, like any other American business, is geared toward the balance sheet of the current quarter or the executive bonus at the end of the current year, MCC does not expect its research programs to produce tangible, transferable results much before the end of this decade. It is an orientation that nearly all members' liaisons say they lack back home.

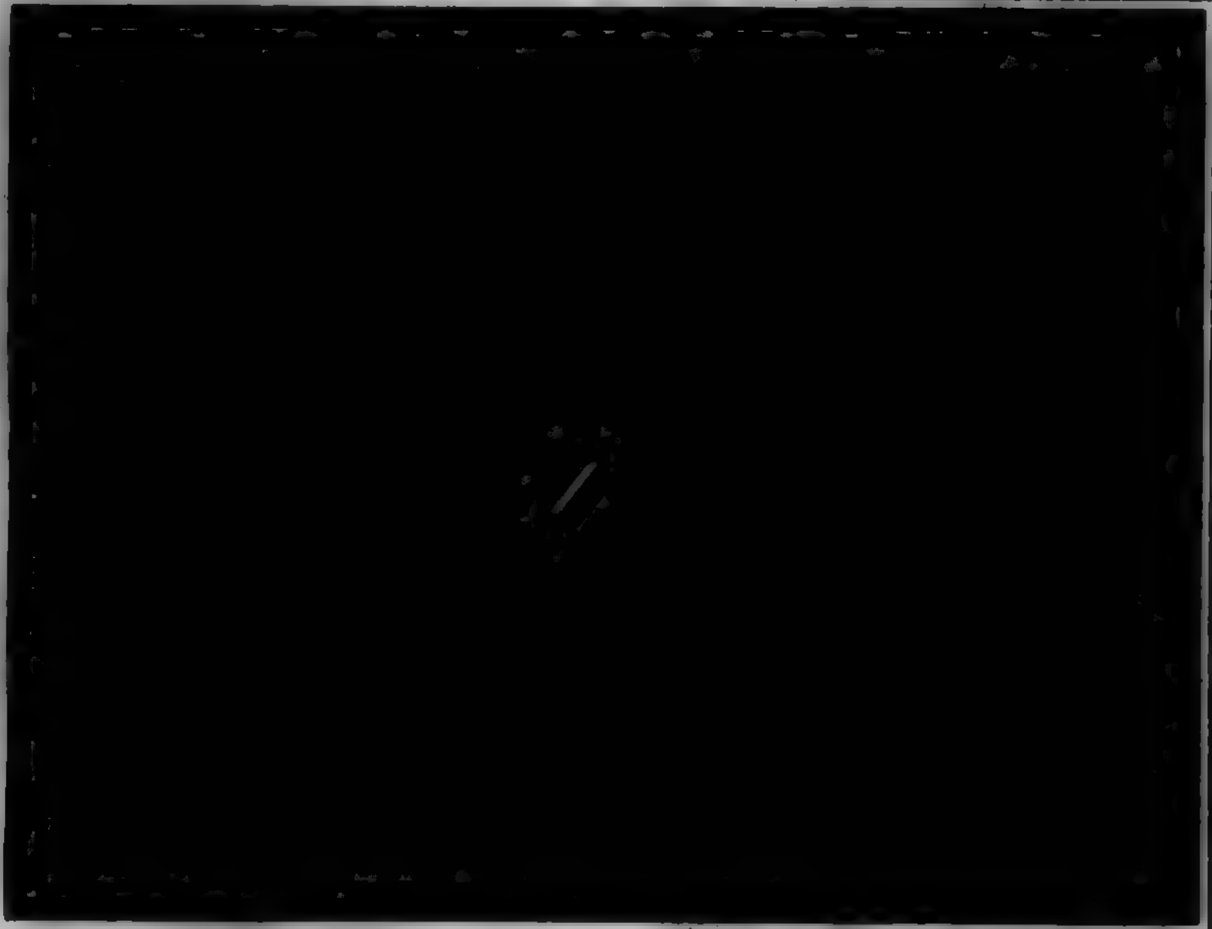
"That is certainly true at Control Data," says Boughter, a researcher in the ACA data base component at MCC. "It's extremely difficult to get funding for any kind of high-risk, long-range project."

"Who in the U.S. first kicked off a fifth-generation project looking at computers of the 1990s?" asks NCR Corp. liaison Joseph Scullion. "We, as companies, simply didn't do it. The advances of the past 20 years have been so rapid that we had plenty to do just mining what we know now without pushing things even further. There was a lack of urgency in looking at the long term."

But the urgency came from across the Pacific when Japan, with uncharacteristic fanfare, announced the Icot program in early 1982. Several computer industry leaders, most vocally CDC Chairman William Norris, decided the U.S. needed more than scattered corporate research efforts in order to keep up with Japan.

"I don't agree that the lack of a centralized long-term effort delayed the development of today's computers," says Honeywell's Hill.

"The advances of the last 20 years came out of the U.S., out of a free market system and piecemeal development. But maybe things have changed, and it's necessary to do it



2400/1200 bps for dial-up data communications

UDS reliability and cost effectiveness are now available in a fully digital, microprocessor-based 2400 bps full-duplex modem!

Our model 224 meets V.22bis specifications for synchronous or asynchronous operation. Its communications efficiency is further enhanced by WECO-compatible fallback capability to 1200 bps (212A). The ANSWER data rate is switch selectable from the front panel; for maximum communications flexibility, the ORIGINATE unit automatically senses the ANSWER modem's setting and transmits at that rate.

The UDS 224 is compatible with 2400 bps, full-duplex modems from most other manufactures for operation over two-wire dial-up or dedicated telephone circuits. Packaged as a free-standing, desk-top device, it supports either permanent or controlled auto answering.

For detailed specifications and quantity prices, contact your nearest UDS Sales Office or Distributor. Universal Data Systems, 5000 Bradford Drive, Huntsville, AL 35805. Telephone 205/837-8100. Telex 752602 UDSHTV.

this way today."

Joint R&D agreements are nothing new, but the merging of 21 diverse companies with outside talent in a 325-employee corporation is. Liaisons talk about gaining a greater critical mass of research talent at MCC and better leverage of their R&D budgets, but they admit the risk is greater, too.

"R&D is always a risky business," says Larry Matteson, MCC liaison for Eastman Kodak Co., which spends $3 million every day on its own extensive research. "MCC's approach is certainly more innovative and has greater risk in that it has the greater challenge of technology transfer. But we hope to get much greater R&D results for the dollar than we would otherwise."

MCC is not viewed by member companies as the end-all of computer research but simply as an innovative project that may or may not pay off handsomely.

"We don't have all our eggs in the MCC basket," says Schneider of Sperry, one of just three members (with CDC and Harris) that have invested in all four research programs. "We have other outside research contracts with the Semiconductor Research Corp. (a 40-member consortium) and universities. We see a higher probability of MCC actually accomplishing something for us, but it's certainly not our only source."

Careful monitoring

Another aspect of risk for MCC is the chance of proprietary research leaking out — either outside of MCC or across MCC program boundaries to a member company not funding a particular program. MCC has followed the lead of Inman's former National Security Agency directorship, monitoring the flow of public information with a very careful hand. Even the lists of what members are participating in which research programs must be released by the companies, not by MCC.

"Regular corporate organizations start by saying nothing is confidential until they make it so. We do it exactly the opposite," says Palle F. Smidt, a Burroughs Corp. and Sperry veteran who became MCC's senior vice-president in charge of programs and corporate planning. "We start with the notion that everything is confidential, and we have to make it not confidential."

Internal security, however, is much more difficult to monitor. With the exception of its clean room for semiconductor research three miles away from the corporate offices, MCC's research rooms are not strictly grouped by the four research programs — Software Technology; Very Large-Scale Integrated Circuits and Computer-Aided Design (VLSI/CAD); Semiconductor Packaging; and ACA (comprising subprograms of Parallel Processing, Data Base, Human Interface Technology and Artificial Intelligence).

A company funding only one research program could pirate trade secrets from the others. But in practice, that hasn't happened, company representatives say.

"Bob Inman has pointed out that MCC is a unique experiment," NCR's Scullion says. "He has requested and received the commitment of everybody here to adhere to high standards of discipline and fairness. We

Members of MCC

Twenty-one U.S. companies own and set policy for MCC. The companies include the following:

Advanced Micro Devices, Inc.
Allied Corp.
BMC Industries, Inc.
Bell Communications Research Corp. (Bellcore)
Boeing Corp.
Control Data Corp.
Digital Equipment Corp.
Eastman Kodak Co.
Gould, Inc.
Harris Corp.
Honeywell, Inc.
Lockheed Corp.
Martin Marietta Corp.
Mostek Corp.
Motorola, Inc.
National Semiconductor Corp.
NCR Corp.
RCA Corp.
Rockwell International Corp.
Sperry Corp.
3M Co.

Associates Program

The Associates Program was formed in 1984 to allow mainly (but not exclusively) smaller companies to learn more about MCC without investing very large amounts of money.

For investments ranging from $25,000 to $150,000 (although most are at the $25,000 level), these companies receive technical reports, attend MCC symposia and have access to other nonpublic, but also nonproprietary, information.

The Associates Program is a means for these companies to get a feel for what MCC does and what technologies might be likely to emerge without getting involved directly in the research.

The associate members include:

Aluminum Corp. of America (Alcoa)
Celanese Corp.
Execucom Systems Corp.
Magnavox Government & Industrial Electronics Co.
Norton Co.
Quotron Systems, Inc.
Rogers Corp.
Saic Corp.
Sheldahl, Inc.
Sprague Electric Co.
Symbolics, Inc.
Tracor, Inc.
Zycad

> *If we just continue to milk the technology that we have in hand, we're going to miss the opportunity that the Japanese have identified to make quantum leaps forward.*

want to foster communication, even across programs, while maintaining an awareness of the fairness doctrine. If a little bit slips through here and there, we really can't cut off all communication to stop a little bit of flow. For the most part, it's a self-policing attitude. People here are much too busy with their own projects to run around being industrial spies."

"In the data base program [of ACA], we work directly with people from CAD and software technology," Boughter says. "If a shareholder in CAD did accidentally get some proprietary information from Data Base, what would they do with it? They're not prepared to receive it, and they're only getting a small piece of what's going on. It could be totally misleading."

The MCC liaison from one CAD program member, Gould, Inc., says that security was a key concern in Gould's decision to join MCC. "One of the tests that I applied to MCC was whether it would be necessary for me to disclose things in the VLSI/CAD program that are proprietary to Gould," says Joseph Rowe, the company's vice-chairman and chief technical officer. "The rules are set up so that you don't have to do that. Sure, one wonders how much hallway conversation goes on. But I have not heard many members express concern on that topic yet."

Another aspect of working together is the varying levels of support for MCC among member companies. Shareholders differ in their approaches to MCC — and enthusiasm is not necessarily commensurate with how many programs the shareholder has elected to join.

"I know that at Honeywell, MCC is held out as a very desirable assignment," says MCC's Black. "Another company [DEC] published its own brochure about its participation, and that kind of publicity is evidence of the value and commitment it attaches to MCC. There are some members with people back at the parent company who believe there are better uses for the resources they have committed to MCC. On the other hand, some companies, left to their own devices, would fund the entire organization."

"Without naming names," says Schneider of Sperry, "some companies are jumping in with more aggressiveness than others. But I believe those are the ones who will get more out of it. That, in turn, may lead to a change in membership as the thing shakes out."

Global significance

In looking at the future, MCC members, while not exactly expecting Japanese surveillance teams to set up shop in Austin, are very much aware of MCC's global significance. It has been said that the landing of a man on the moon, perhaps the U.S.'s greatest technological achievement, occurred because the goal — to succeed before the end of the 1960s and before the Soviet Union — was so clearly defined. Will the fifth-generation computer be the Apollo spaceship of the '80s and '90s?

"I think it is a race," says NCR's Scallion. "If we just continue to milk the technology that we have in hand, we're going to miss the opportunity that the Japanese have identified to make quantum leaps forward in computer technology. What is different now is that they have said they're not just going to follow a year or two behind [the U.S.] and do it cheaper and take the market away that way. They have actually stated a different perspective than they ever have before: 'We will be the leading information processing country in the 1990s.' They've identified that as the only way to have a strong economic position, because the only resource they have is their people."

"It's not a race like creating the atom bomb during World War II," says Honeywell's Hill, "as much as it is a kind of rededication on the part of the U.S. to technology as a way of life."

The ideas of national urgency and

Research breakdown

MCC members can choose one or more research programs in which to participate. Their choices include the following:

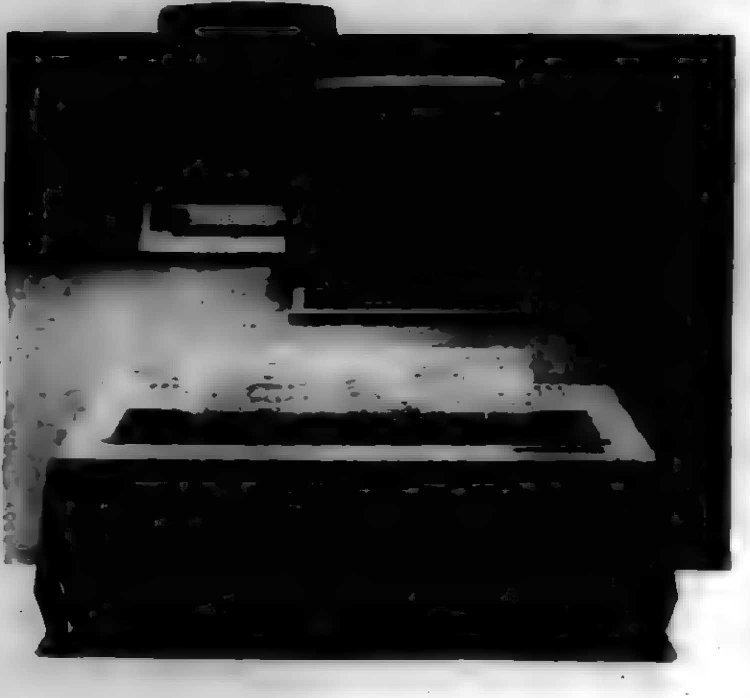
Advanced Computer Architecture: DEC, Sperry, Eastman Kodak, NCR, CDC, Honeywell, Bellcore and Harris.

Packaging and Interconnect Technology: DEC, Sperry, Eastman Kodak, CDC, Allied, Boeing, Mostek, Advanced Micro Devices, BMC Computer Corp., 3M and Harris.

Software Technology: DEC, Sperry, CDC, Bellcore, Lockheed, RCA, Rockwell, NCR and Harris.

VLSI/CAD: Sperry, CDC, Honeywell, Gould, Mostek, Advanced Micro Devices, Lockheed, Harris, Martin Marietta, National Semiconductor, NCR, Motorola and RCA.

YOUR IBM 3270 AND YOUR IBM PC NOW HAVE SOMETHING IN COMMON BESIDES THEIR PARENTS.



THEIR PRINTER.

It's one thing for a high speed dot matrix printer to be plug-compatible with the IBM 3270 system.

It's quite another for the same printer to work in the ASCII universe, where IBM's PC communicates.

But the Datasouth CX 3180 is quite another kind of printer.

First, the CX 3180 does more for less. Because while the 80 cps version of the IBM 3287 costs $4800, and the 120 cps version costs $6000, the CX 3180 cruises at 180 cps and costs only $3195.

Second, the CX 3180 is truly plug-compatible, with a coax interface for the 3270 world and a parallel interface for the PC world. With no black box and no extra cables.

The CX 3180 even features dual legends on its sophisticated front panel controls. One set emulates the IBM 3287 and the other works for your PC—or for any other ASCII computer. And the parameters are switch-selectable.

The CX 3180 is also a printer in the Datasouth high performance tradition. Which means it's one of the most rugged and sophisticated printers ever made.

So if you want the best of both worlds, get the one printer that does it all: the Datasouth CX 3180.

For more information about the CX 3180 and the whole family of high performance Datasouth printers, call toll-free.

leading-edge, quantum leap computer research — the type of MCC — can only sustain the project for so long. The headlines about MCC's formation and the controversy over Inman's selection to lead it have given way to a quieter period in the last six months, one that has prompted skeptics to ask, "So what are they really doing down there?"

But MCC insiders say this is when the true progress has occurred — the steady increase in employees and an unexpected breakthrough in research methodology that has given the participating members a tangible new way of doing research that they can apply in product development back home. MCC officials are predictably tight-lipped about this proprietary deliverable, but liaisons say it is a good indication of MCC's progress exceeding its expectations.

"We fully expected there would be a long period of time where we would have to learn to work together and that it would be two to three years before we began to see anything," Scullion remarks. "The fact that we're seeing something in 1985 is a pleasant surprise."

No MCC label

All comments about MCC's success to date, however, come with an implicit qualification. There will never be a computer, software package or chip that bears an MCC label — only MCC research gains that help build those products.

While MCC, specifically Smidt, has devoted hundreds of man-hours to drawing up a formal plan for transferring and licensing MCC technology to the companies that paid for it, MCC must, by strict antitrust law, stay away from product development at the shareholder level.

So MCC's ultimate success or failure will not be determined in Austin, but in product development plans at DEC in Maynard, Mass., or Honeywell in Minneapolis or Sperry in Blue Bell, Pa.

"If we have done our part of the job, but the (shareholders) cannot cope with the business issue and not get the performance out of the deployment of our resource, then we will look bad also," Smidt says. "We can only make things possible. . . we cannot execute the possibility."

Because 21 different corporations hope to convert MCC advances into money-making product lines, there could be as many as 21 different approaches to aid and abet that process. In reality, some companies have set up similar types of MCC tracking at their own corporate levels, but there are differences as well.

DEC, for example, has established and funded formal "advanced development organizations" within the company to keep tabs on MCC research, trying to ensure that the research remains relevant to DEC's research goals. "These groups are an integral part of product development organizations," says DEC liaison George Champine. "They are in the best position to pick and choose the right technology to go into the right products at the right time. There is a formal funding program to help that happen within Digital."

Honeywell's tracking is not quite as formalized as DEC's, but it is every bit as committed to maintaining constant contact. Last month, the company sent 30 of its research and product development employees to Austin for two "Honeywell Days" to learn more about the direction of the human interface program within ACA.

"We've tried to push the contact level down as close to the grass roots as possible — we think that's the way to do technology transfer," Hill says. "We have an established organization that's the focal point for contact with the ACA program and a number of other divisions

"THERE ARE THOUSANDS OF THEM, AND THEY'RE ALL HEADED FOR CONCORD!"
"AND RIGHTLY SO. THEY'VE GOT THE BEST 2400bps MODEMS AROUND."

H. Pyle. Victory Parade 1783. Courtesy The Bettmann Archive.

If you're ready to join the ranks of thousands who are saving time and money with 2400bps dial line communications, go with the leader—Concord Data Systems. Our CDS 224* is today's largest selling 2400bps modem, chosen by companies such as Tymnet,® ADP® Autonet,® Dysan and others. Surprising? Not when you realize that Concord Data was installing thousands of 2400bps modems throughout the world before most companies had their products off the drawing board.

Concord Data modems are built to give you years of trouble-free service. Based on *proven* VLSI designs and Concord ingenuity, our modems pack more high-performance features and time-saving options than any other 2400bps dial line modem on the market. You can choose automatic dialing, error protection, statistical multiplexing and more. We have stand-alone units, plug-in PC-compatible cards, and industry's only single-card rackmount modem that operates at 2400, 1200 and 300bps. With prices starting at $450,* Concord Data modems are not only your best bet, they're your best buy. To get in step with the communications leaders, call us at (617) 890-1394 or write 303 Bear Hill Road, Waltham, MA 02154, telex 951793.

with specific interests that have established their own contacts as well. It's kind of a loose federation, but it seems to be working. And part of our job as liaisons is to contribute to managing that flow of information while we're here."

At NCR, the tracking consists of reorienting relevant departments to follow MCC, rather than establishing new organizations. "We haven't formally established programs that track, one-for-one, what's going on here," Scullion says. "We have identified those areas within the operating units of the corporation that will best utilize the technology we're developing. It's not exactly a shadow organization, but a question of identifying the things that are already established as the appropriate transfer points."

The need to create some sort of mechanism for the transfer may have the residual benefit of learning to streamline research, product and strategic planning communication within the member companies, Hill believes.

"Before MCC, we all tended to underestimate the technology transfer problem, even though we faced it internally," the Honeywell veteran says. "We have advanced technology labs that are different from product development divisions, and we have gone through the experience of trying to move the technology out of the lab into a production setting. When it got difficult, we'd just sort of run into it and say, "yes, it's a problem," without approaching it in any kind of organized way. But now we're in a situation where it's the name of the game."

The speed of the research-into-product process will be critical as well. Although the research itself takes place in a long-range time frame, the time for converting research advances into corporate revenues is shorter than ever. "When I started in the industry in 1959, we had things in the product line that generated revenue for 30 and 40 years," MCC's Smidt explains. "Today, there are products that spend less than 12 months in a revenue-generating phase. So if you miss time, it has a tremendous effect on your competitiveness."

In mid-1985, the members' judgment of the technology transfer process, and by extension the success of MCC, remains a waiting game. There will most likely be no tangible evidence for that judgment for several years. But no members are publicly voicing regret that they got involved; most believe that MCC has gone well so far, and they are willing to stick around for the long term. MCC officials happily point to the recent unanimous, eight-shareholder vote to increase their investments in the already highest funded ACA program as a good sign.

"I don't think any of the shareholders have set any specific goals in terms of target dates," Hill says. "They all realize this is a 10-year program, or maybe even longer."

> ”
>
> *In mid-1985, the members' judgment of the technology transfer process, and by extension the success of MCC, remains a waiting game.*

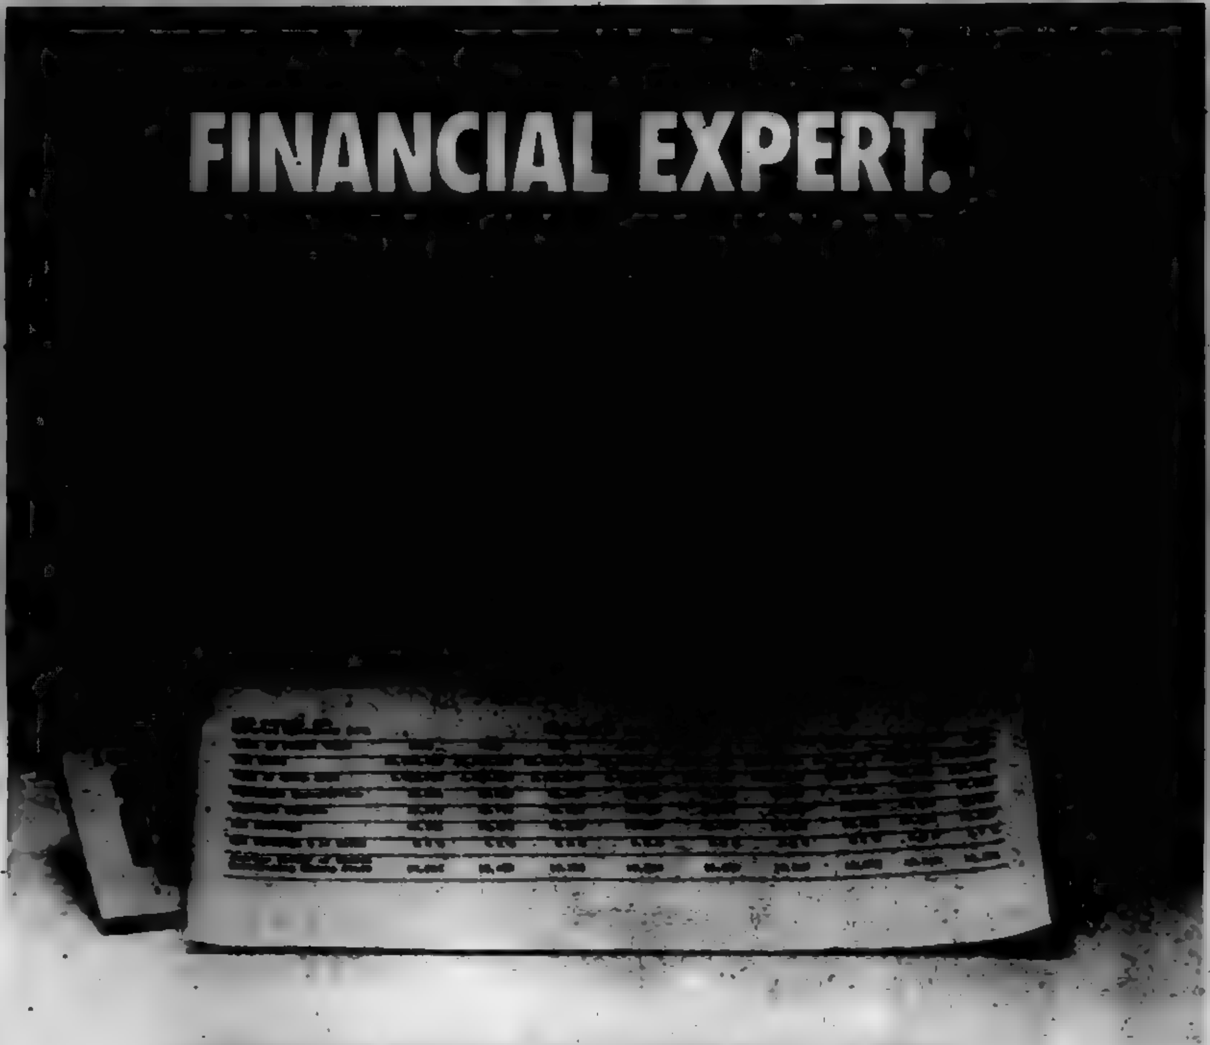
"We can only judge qualitatively at this point," says Sperry liaison Schneider. "The research programs are still new. . . the software program is very, very new, with the leader [Belady] coming on board less than a year ago. In terms of working out the responsibilities of a lot of different people, MCC has so far done all the right things. That doesn't guarantee success, but the things are in place that spell success, or at least a high probability of it."

Ultimately, the power of MCC to guarantee its own success is limited. Its long-term survival, financially as well as in the eyes of the industry, depends completely upon what happens when its research gains are sent back to its members.

MCC will derive income from royalties on the sale of products that incorporate its technology, but more important, the successful development, marketing and sales of those products will be the gauge for members to decide to stay with MCC, increase their investment in it or abandon it.

"If the performance is not up to its budget in the shareholder environment," says Smidt, "everything will be ascertained as to whether they should still put that much money in this or that. That's an area that will never go away, and MCC, because it's long term, obviously does have exposure in that area."

"MCC can do the best research and document it in an absolutely top-rate way," adds Bill Stotesbery, MCC's director of government and public affairs. "But if it goes back to the companies and isn't used, then we'll still be viewed as a failure. It's not only critical to the commercialization of the research, it's crucial to MCC's future as well."



With the ADM™12plus, you'll have video display terminal features that range this wide.

Thanks to the wide page display of Lear Siegler's ADM 12plus, it's the ideal video display terminal for financial spread sheets, flow charts and word processing.

The impressive list of specialized ADM 12plus capabilities includes selectable 80 or 132 column display and variable format display memory. This lets you store data in pages of up to 158 columns wide or 48 lines long and review them with horizontal or vertical scrolling. And you get 32 programmable functions with 400 characters of memory, programmable cursor keys, bidirectional printer port and independent baud rates. Plus, the ADM 12plus is compatible with the TeleVideo 912, 920, 925 and 950 as well as Lear Siegler's ADM 2, ADM 12 and ADM 31 terminals.

Call for complete information on how Lear Siegler's ADM12plus can be your financial expert.

"Computer-aided design and drafting systems? They are all basically the same. Just select one and get to work!"

"Picking the right system can be the difference between success and catastrophe. Benchmark and study all you can!"

Picking the best Cadd system for you

By Joel Orr

The right course in choosing a computer-aided design and drafting system (Cadd) lies between "select any one" and "study them all." There are differences — some substantial — among systems; there are greater differences among vendors. Most important is matching what the vendor is offering to what you need.

Most Cadd disasters are caused by users focusing on system features instead of their own requirements. As with most types of computer systems, it is incumbent upon the buyer to figure out just how to apply the computer to the task at hand. Those who fail to do so have no one but themselves to blame for a negative outcome.

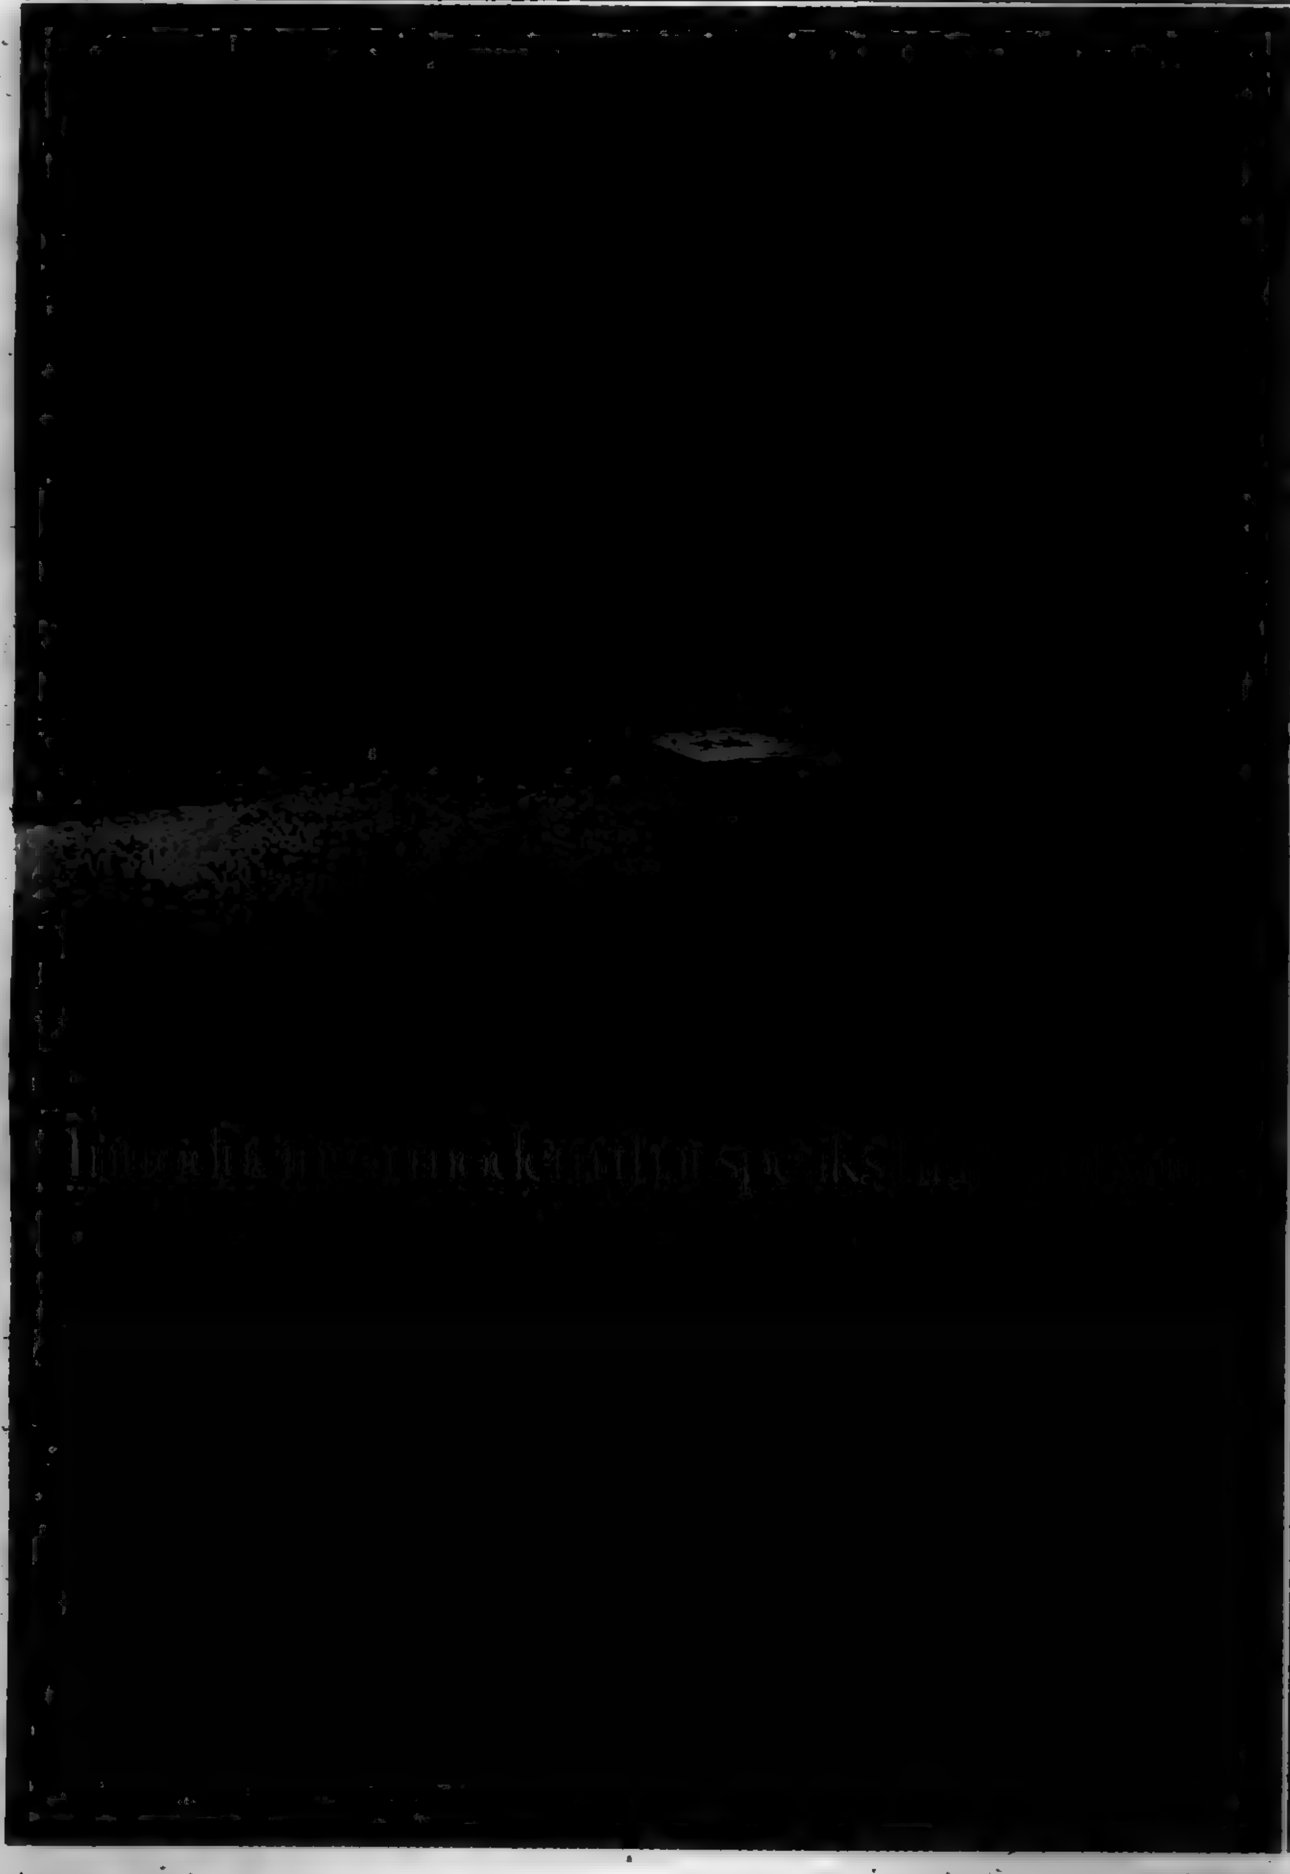
Turnkey Cadd systems constitute single-source solutions to the problems of drafting and design automation — or do they? Pro:

> ”
>
> *Turnkey Cadd vendors have ranked among the fastest growing and most profitable enterprises in this country for several years.*

The many success stories showing genuine gains in productivity (at least for drafting). Con: The fewer — but disturbing — accounts of catastrophic failures. These complex and powerful tools can be well-used or misused.

Fifteen thousand turnkey Cadd systems testify that this approach to engineering automation is popular. Some estimates show turnkeys holding more than 80% of the Cadd market (if IBM's products are counted as turnkeys). A turnkey is commonly defined as a combination of hardware and software acquired from a single supplier that requires no additional purchases before it can be put to its intended use.

This definition does not touch upon the main reason Cadd system purchasers prefer turnkeys to the alternatives: an understandable fear of confronting the problems of interfacing pieces of hardware and software.



The rampant growth of technology has led to increasing specialization of suppliers. Those who make excellent computers seldom have the resources to become expert at producing applications programs. Manufacturers of color displays rarely develop fine computers. Other examples abound; clearly, there is simply too much to know about Cadd technologies for a single supplier to do it all very well.

Another type of diversity is apparent in marketing. Firms that sell components of systems do not usually become successful systems suppliers. The two markets are very different and require different strategies and tactics.

Components vendors must have a thorough understanding of the technical aspects and competitive benefits of their products and must be adept at negotiating. Sellers of systems must develop a sensitivity for organizational considerations and must be more attuned to solving the customer's problems than to meeting his stated needs.

Turnkey systems suppliers take the responsibility of making the system components work well with one another, both prior to system installation and (usually) for the useful life of the product. Simple economics would indicate that the addition of the middleman between the manufacturers of system components and the consumer requires the price of the turnkey to be greater than the prices of the sum of its parts, and this is indeed the case. But most buyers feel the difference is well worth the cost.

Suppliers feel that way, too. Turnkey Cadd vendors have ranked among the fastest growing and most profitable enterprises in this country for several years. And for most of the leading Cadd vendors, field service is a profitable operation.

Getting more

Turnkey Cadd systems are tools of considerable generality. To get the most from them, users must take advantage of the customized features provided by the vendors. On most systems, it is possible to group combinations of oft-repeated commands as a new command, which can then be activated by a single menu pick or keystroke.

At Boeing Commercial Airplane Co., families of parts have been defined on Computervision Corp. systems so that new parts can be drawn by merely entering a few parameters. This arrangement saves time and money and ensures consistent and accurate drawings.

Nonturnkey systems are often more difficult to customize than turnkeys. While they are ultimately more

IF ANY 3M, MAXELL, OR DYSAN FLOPPY DISK FAILS, WE'LL REPLACE IT WITH A NEW VERBATIM® DISK. FREE.

Most floppy disks come with a guarantee; if they ever fail, the manufacturer will send you a brand new one. But let's face it; if a particular brand of floppy disk ever loses your data, you might not want another one of theirs.

That's why Verbatim is offering a very special guarantee: If you buy a 3M, Maxell, or Dysan floppy disk — and it fails — we will replace it with a brand new Verbatim disk. Free. Why are we making this offer? Because we think it's time you use a floppy disk you can always count on. Verbatim.

© 1985 Verbatim Corporation

VERBATIM. YOU CAN COUNT ON US.

Mail your failed 8", 5¼", or 3½" disk in its original envelope, along with your name and address, and the brand and model of your computer system, to: Verbatim Offer, P.O. Box 7306, Clinton, IA 52736. Limit one refund per name and address. Offer limited to the first 100,000 3M, Maxell, or Dysan failed disks received. Offer expires October 1, 1985. Void where prohibited by law. Offer rights are not assignable or transferable.

flexible, their modification often requires professional programmers; turnkey systems were designed to be customized by nonprogrammer engineering users.

Purchase alternatives

Users can select a software package, then buy a computer to run it. Making sure of compatibility, they may choose graphics workstations and output devices. A local-area network could be added, completing the customization of the Cadd system.

This strategy would make it possible to take advantage of the highly competitive pricing in high-technology markets while acquiring components suited to your needs. The only catch is that the user has to make everything work together, and the components are so complex that they must be made to work together.

> ”
>
> *Some companies have strong computer departments that can undertake support of a multivendor system; most do not and do not want to build them.*

This problem can be avoided by securing the services of a systems integrator — a service firm that helps select the equipment and software, negotiates with the suppliers, performs the integration and leaves the user with the apparent equivalent of a customized turnkey system — and potentially, the seeds of a major disaster.

Here's the problem: Independent vendors of hardware and software will often assure customers that their products will work together, and they rarely lie about it. At the time the assurance is given, their statements are usually valid.

However, software — and to a lesser degree, hardware — changes. The supplier provides periodic updates to the original product. Because business relationships are dynamic, products often cease to be compatible with each other. The hapless user is then faced with keeping the older products and eschewing updates (an intolerable condition in a society in which everything must improve periodically) or paying for the expensive expertise required to maintain compatibility among the latest version of the products.

Some companies have strong computer departments that can undertake support of a multivendor system; most do not and do not want to build them. These organizations find turnkey systems to be the only way they can acquire Cadd.

Data management issues

Because most turnkeys are configured as a computer with semi-independent workstations, growing beyond the number of workstations that the computer can support with adequate responsiveness generally forces the user to acquire an additional computer. (Decentralized systems, such as those based on Apollo Computer, Inc.'s Apollo, don't have this problem).

In the past, the number of workstations was usually between four and eight. With the current batch of superminis (Digital Equipment Corp.'s VAX-11/785, Data General Corp.'s MV/10000, IBM's 4361, Prime Computer, Inc.'s 850 and others), that limit has risen to about 16.

However, there is almost always such a limit — and when it is reached, another computer and contingent of peripherals must be acquired. Sharing a large engineering data base under a multicomputer arrangement is complicated, because many of the aids available in a single-computer situation must be emulated through procedures. For example, most operating systems will not permit two files to have the same name; when two systems are used, few of the networking arrangements in use today can exert such constraints.

While similar difficulties occur with nonturnkey Cadd systems on small computers, vendors of such software generally allow the packages to be used on a broader range of computers than do the turnkey vendors. For example, Matra Datavision, Inc.'s Euclid can run on VAX systems of all sizes, while Applicon, Inc. (a turnkey vendor) supports only part of the VAX line.

Furthermore, the networking activity itself often adds computational overhead to the system, impairing responsiveness. As networks on chips develop, this problem will diminish.

With a relatively large number of workstations, users often decide to set up a central plotting facility with a full-time plotter operator. Doing so requires the system to support spooling, wherein plot files are placed in a queue along with instructions to the operator. The operator can manage the queue by changing plot priorities and directing output to different plotters. Not all turnkeys support such an arrangement.

The user who wants to expand by acquiring a different type of turnkey is in for some disappointment if he expects to share data between systems from two different vendors. While arrangements exist for transferring data (see box), they are neither fast nor convenient. Only if the data bases of the two systems are to remain separate, with occasional transfers of small numbers of files, can such a configuration work. Turnkey system vendors leave

(Continued on ID/24)

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:

- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC, PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

IBM, IBM PC, PC XT, 3270 PC, XT/370, PC AT, and AT/370 are registered trademarks of International Business Machines Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

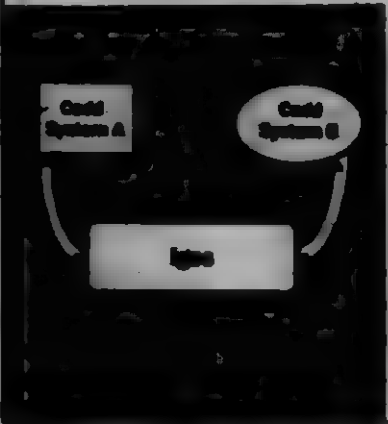
Data transfer between Cadd systems via Iges



Translating data from one Cadd system to another is difficult because representation formats are considered proprietary by the Cadd system vendors. A neutral format called Iges — Initial Graphics Exchange Specification — was developed to deal with this problem. Vendors need only provide translators from their proprietary formats into and out of Iges. File translations can then be effected by converting one system's file into Iges using the translator supplied by that vendor, then converting from Iges into the format of another system, using the second system's Iges translator.

Translation via Iges takes, at best, several minutes for an average engineering drawing. Extensive editing of the converted drawing can add hours to the translation process. In many cases, entering the drawing into the new system by hand might be more cost-effective.

Iges is the product of a committee founded by General Electric Co., Boeing and the National Bureau of Standards.

Almost all Iges post-processors (translators out of Iges) work well. Many vendors, however, have produced poor preprocessors (translators into Iges), because they don't want to make it easy for customers to convert their data for use on other systems. Consequently, service bureaus have sprung up to meet the need for thorough data conversion.

Iges makes it possible to convert drawings from one system to another, but it doesn't make it easy. Information is available from NBS, Building 220, Room A353, Gaithersburg, Md. 20899.

Designing and drafting

Computer-aided design and drafting (Cadd) is a phrase that glues together two terms of very different scope. Drafting is the producing of drawings; design is the ordering of intentions. Drafting is the most common way of giving form to designs, much as typing is the most common way of giving form to writing.

All Cadd systems have certain components in common: a computer; a workstation with a graphics display and an input device; a graphics output device; and Cadd software. They range in size from desktop personal computers to the largest of mainframes, supporting hundreds of workstations.

They can be centralized, like the IBM/Cadam system; decentralized, like the Auto-Trol/Apollo system; or a bit of both, like the Intergraph system. Prices range from $7,300 for a tiny Robographics turnkey, complete with plotter, to millions of dollars for a large Control Data Corp. Icem system with dozens of workstations.

Most Cadd systems are not used for other functions; doing so would negatively affect workstation response time, which is one of the most important ergonomic characteristics of a Cadd system.

Computer-aided drafting is easy to cost-justify because drafting has a well-defined and measurable product. The benefits of computer-aided design, on the other hand, must be taken largely on faith. Small wonder, then, that most of the 15,000 Cadd systems in use are made to function as drafting machines and that designers seldom use them.

Drafting systems for most engineering disciplines are similar; they must all permit the rapid production of drawings. Electronic, mechanical and architectural drafting demand lines and curves, text and symbols, panning and zooming and so on — but to varying degrees.

Design systems are applications oriented: Schematic capture systems must preserve topological continuity but have little use for shaded areas; mechanical design must have 3-D, which is of little use to the creator of integrated circuits. It is also helpful for design systems to interface to application-specific analysis programs that are seldom marketed by the Cadd system vendor.

SEARCH and you will FIND...
...Even faster than Spot!

Spot's friendly and so is SEARCH...
Spot's smart and so is SEARCH...
Spot finds things that are lost and so does SEARCH...
Spot can be your best friend...
...and SEARCH will be your business' best friend

If the system you use makes it difficult to find information, you need SEARCH.

SEARCH is the information retrieval software that provides fast, comprehensive searching and display of all types of textual documents — letters, memos, reports, contracts, proposals — from one page to hundreds of pages.

SEARCH is the only program that lets you store and retrieve information in its natural state — original text. It's easy to use because it stores and retrieves the way you write and think. Your word processing output can be the input to SEARCH, eliminating the need to index or tag specific parts of your text for retrieval. Every word is stored for searching, even the full text of long, multipage documents.

SEARCH was developed by BRS, one of the largest online systems in the world. It's design reflects the experience of thousands of information professionals performing millions of online searches.

Power...
Flexibility...
Ease of Use.

SEARCH is the ultimate retriever for all your information management needs!

For mainframe, mini and microcomputer systems.

Pros and cons of leading turnkey Cadd systems

Selecting a turnkey Cadd system is a difficult and lengthy process. Describing the user's needs in functional terms is the hardest part. The functional specification makes it relatively easy to narrow down the choices so that final selection can be based on issues other than functional ones — for example, price and delivery.

The fact of the matter is that there is no best turnkey Cadd system or vendor; all the leading ones have pros and cons.

Here are some opinions on the best-selling systems:

IBM. While technically not a turnkey vendor (IBM sells its computers and workstations with third-party software — Cadam, Catia, Caeds and Cbds2), the largest computer company is also the largest Cadd vendor.

IBM has good computers, nice displays, excellent service, software that is poor in features compared with the other leading systems and intriguing plans for networking personal computers, 4300s and so on.

Computervision Corp. The largest Cadd-only company has undergone a transformation in the last two years from "aging leader with dying product line" to "dynamic mini-conglomerate."

An almost miraculous transition to using other people's hardware (Sun Microsystems, IBM) and software (CIS, OIR and others) has given this company a new vitality and a convincing sales story.

One concern is that a full-blown system involves hardware and operating systems from Computervision, Sun and IBM — a cumbersome mix. It is not a good "casual use" system; but it is strong across a wide range of applications, such as electronics, mechanical engineering and now architecture engineering and construction.

Intergraph Corp. This leader in mapping and architectural Cadd has become a major contender in the mechanical and electronic Cadd markets.

A well-integrated mix of Digital Equipment Corp. computers and Intergraph workstations and other devices (file processor, graphics processor and so on) presents a uniform personality to the user.

Intergraph features the best graphics. Ease of learning makes for a reasonable casual use system.

GE Calma Co. This company offers a range of products in all Cadd disciplines. After a rocky transition to General Electric ownership, a coherent product line and strategy are expected to emerge.

Calma has a reputation for excellent software but inconsistent responsiveness. GE ownership was expected to improve that situation, but those hopes have been only partially fulfilled. GE's determination that Calma spearhead its CIM efforts is sure to make a difference in the long run.

Applicon, Inc. The first turnkey Cadd vendor with raster displays was one of the last to take full advantage of them. The Bravo system had the makings of the first truly integrated CAD/CAM turnkey, but its introduction was long delayed and fraught with problems. Applicon's strengths are its integrated circuit design and mechanical design (especially solids).

Applicon lost much of its Bravo-given momentum when the product took a long time to live up to specifications. The departure of President Don Feddersen several months ago to pursue venture capital interests hurt the company's image in terms of stability.

The early performance limitation of Bravo gave it a bad reputation. Today, the system is a viable contender in terms of function and should help maintain the company's leading position.

McDonnell Douglas Automation Co. (McAuto) This aerospace company bought the firm that produced Unigraphics years ago and has nurtured it into one of the main Cadd systems on the market today. Lack of integration with solids and poor workstation ergonomics have recently been remedied. Interestingly, Unigraphics II (the current product) is available on DEC, IBM and Data General Corp. processors.

An unrelated system, BDS/GDS, is offered by McAuto on Prime Computer, Inc. and DEC processors in the architecture engineering and construction market.

Easy to learn, Unigraphics II is one of the best injection mold Cadd systems. The broad range of processor and display options is very convenient for customizing a system.

BDS/GDS on the Microvax with Tektronix, Inc. terminals is a high-power, low-cost system, which should prove attractive to medium- and large-size architectural firms.

Control Data Corp. Even more than IBM, CDC offers a broad range of Cadd systems and terminals. Systems range from micro-based electronic Cadd units for schematic capture, to very large configurations supporting dozens of terminals that function as complete mechanical design and manufacturing systems. CDC has an attractive data management/human interface regulating program called Engineering Data Library.

The company offers a broad range of services, including consulting, time-sharing, education and financing. The system is powerful but not easy to learn.

Auto-trol Technology Corp. This company sells two separate software packages (Series 5000 and 7000), corresponding to architectural Cadd and mechanical Cadd/CAM. Auto-trol was the first firm with a truly distributed system based on the Apollo computer network. Auto-trol's software also runs on the DEC VAX.

Having experienced a difficult time in business two to three years ago and changes in management, the company is now profitable and back on track in terms of growth. The architectural product is interesting, but the mechanical product is exceptional.

Ease of use and the network concept make this system one of the best for casual use.

Others systems include the following:

- **California Computer Products, Inc.** — interesting architectural system.
- **Gerber Systems Technology, Inc.** — good five-axis machining.
- **Graftek/Burroughs Corp.** — nicely integrated with solids and CAM.
- **Mentor, Daisy, Valid Logic** — the leading integrated-circuit design systems.
- **Matra Datavision's Euclid** — elegant solids, good CAM, great user programming language.

For low cost, Micro-Installation's packaging of Autocad with an NEC Corp. micro, sold as a turnkey, is an excellent buy.

Turns
Spaghetti Code
COBOL Into
Structured
COBOL
Automatically

SUPERSTRUCTURE takes your unstructured COBOL programs and automatically produces structured COBOL programs that are easy to understand and maintain. SUPERSTRUCTURE provides a simple and cost effective alternative to manually rewriting those unstructured programs that are a maintenance nightmare. Of course you can't believe it. Let us prove SUPERSTRUCTURE works, using your programs at your location. SUPERSTRUCTURE— the breakthrough you've been waiting for. Call today: Marketing Director— SUPERSTRUCTURE.

> ***While many vendors pay lip service to the concept, there are no working examples of complete CIM implementation and only a handful of partially operative CIM installations.***

(Continued from ID/20)

prospects with the impression that all required training is vendor supplied. In fact, vendors do supply all the user needs to know about operating the turnkey system — but this is only a portion of the knowledge required to use the system effectively.

The onus is on the user to determine exactly how the system is to be integrated into the organization's operations. Once standards and procedures for the automated operation are developed, they must be used to develop a training course that integrates systems knowledge with procedures. Doing this properly yields substantial benefits; most users discover the need on their own, however, after much time has been wasted, because few of the vendors make the need clear.

For the most part, turnkey Cadd system vendors sell tools for the automation of existing engineering activities — principally, the creation of drawings. But drawings are out of place in computer-integrated manufacturing (CIM). In CIM, three-dimensional models are the basis for integrating manufacturing functions; they cannot be derived from drawings. Because of user reluctance to plunge into three-dimensional design, vendors have developed many demonstrable but untried-modeling system features.

Another cause of vendor reluctance is that CIM will demand customization, and turnkey vendors are not sure they can make money selling such services along with their products.

As a result, turnkey Cadd at large is not ready for CIM — but then, neither are most users. CIM requires a commitment to sweeping organizational changes that few users are prepared to consider. So while many vendors pay lip service to the concept, there are no working examples of complete CIM implementation and only a handful of partially operative CIM installations.

The demands of users for highly responsive Cadd workstations, coupled with the availability of low-cost, high-power computers, will surely lead to a proliferation of networks of powerful independent workstations as the dominant Cadd turnkey configuration. The growth in the average size of such networks is already forcing vendors and users alike to pay more attention to the data base issues.

The greatest obstacle to progress toward CIM is traditionalism. "We've always done it this way [whisper] and we are frightened by the implications of automation!" is the credo of many manufacturers. Technology is available today to make vast improvements. To take advantage of it, manufacturers must face the organizational and social issues squarely. Turnkey system vendors can help but cannot lead.

Buying a turnkey system relieves the user of many integration problems. But a turnkey is not a panacea; the user must still invest heavily in planning, training and customizing. The difference in cost between turnkeys and home-assembled systems is worth it for most users. Let the user remember that the success of the installation is not the responsibility of the vendor. Caveat emptor.

About the author

Joel Orr, a speaker and author on graphics, heads Orr Associates, Inc., an industrial automation consulting firm in Danbury, Conn. He is a founder of the National Computer Graphics Association and director of the Cadd/CAM Institute in Danbury.

Some people just ask for trouble.

Isn't it amazing just how many people go around asking for trouble?

Why, we're willing to bet there are people in your DP department this very minute flirting with disaster.

They're running the risk of a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error bringing the whole kit and caboodle to a screeching halt.

When all they have to do to keep things running smoothly is use our JCLCHECK™ program.

JCLCHECK software catches all JCL errors and provides complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

No more errors — no more troubles. It's that simple. And successful.

Over 400 DP departments now use JCLCHECK software to correct the errors of their ways, and save money at the same time.

To put it in another perspective, we'll send a sales representative out to analyze your operation and provide a written statement on exactly how much time and money you're spending on JCL errors. And how much you could be saving with the JCLCHECK package.

Still, some people are destined to find these things out the hard way.

To that we can only add, better them than you.

Yes, I want to stop living dangerously.
☐ Send me details on the JCLCHECK program.
☐ Have a representative call me.

Where are the robots?

By R. C. Reeve

Five years ago, the drums of the robot revolution were beating feverishly. Predictions eclipsed predictions in projecting a new world of robots. Where is that revolution today? Are the robots still coming? And how will they impact data processing from the factory?

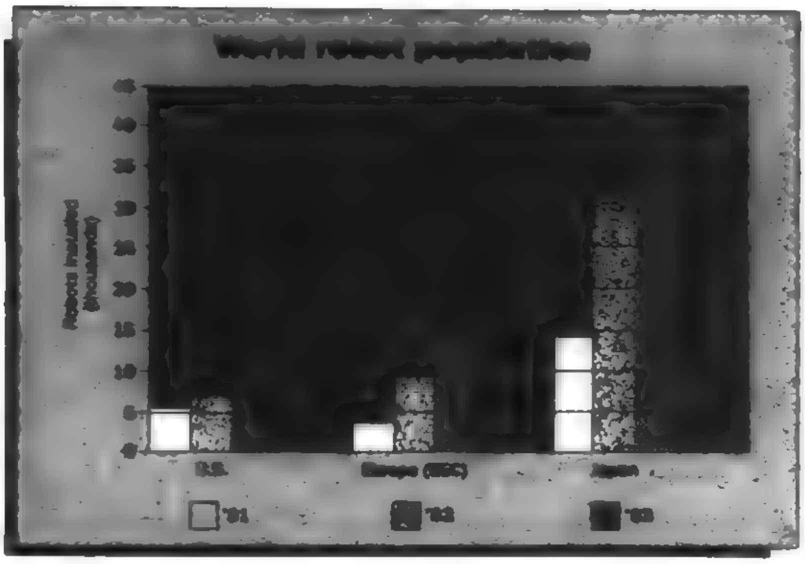
The Japanese dominate the world in installed robots. The Robot Industries Association recently reported the 1983 robot population in Japan at 41,000, in Europe at 13,000 and in the U.S. at 9,000.

Japan is employing more than four times the number of robots as the U.S. This statistic is even more alarming when factored by the relative size of the respective manufacturing economies. Some choose to disagree with the accuracy of these estimates based on differences in definitions of robots. However, the bottom line is that there are more robots in Japan than anywhere else in the world, and even Europe is ahead of the U.S.

It is little comfort that the robot revolution is safe and secure in Japan and Europe, because this technology has the potential to be the most human-felt ingredient of the computer age. Why is U.S. industry desperately lagging in installed robots? Will this create a robot technology gap?

The answer to the great disparity between the number of robots in Japan and the U.S. appears to be too simple. The Japanese want to use robots! Americans seem to be more interested in robot technology than in using robots in production.

This attitudinal difference may be linked to America's feelings about manufacturing. Manufacturing fell out of vogue in the U.S. about 30



years ago. American business fortunes are currently made through high technology, service, banking, finance and the information revolution.

Manufacturing remains behind the scenes. Everyone knows it's there, but no one wants to take responsibility. After all, what type of cocktail chatter would setting a new record in reducing quality defects make? Nothing exciting here. Henry Ford stories are passe.

Commitment to quality

The Japanese are totally committed to manufacturing. They have pursued a national goal of quality in manufactured goods for the past 30 years. When capital investment decisions are based upon a need for quality vs. a saving in labor costs, different conclusions are reached. Robot justifications based on quality requirements are more economical and viable than those based solely upon labor savings. The problems facing U.S. manufacturers today are the result of 30 years of neglect.

The U.S. was once the greatest manufacturing nation on earth. The size and prosperity of the American market invited large investments in dedicated automation for high-volume products such as automobiles and appliances.

But as America's basic needs for shelter, food and transportation were fulfilled, consumers turned to specialized products to satisfy their personal tastes.

During the 1960s and early '70s, the Europeans, who were experts in producing quality products for low-volume markets, captured a significant share of the U.S. market. With the strong U.S. dollar in their hands, eager consumers scooped up these high-quality European products. During the '70s and '80s, the Japanese came with variety, quality and price — far too much for the American consumer to resist.

The battle for today's consumer's dollar is being won by perfecting the manufacturing process. Automation and quality control are the battle cries of new-wave manufacturing. U.S. manufacturers continue to retreat to the high ground of volume products, clever advertising, promotions and balance sheet restructuring through consolidation and depreciation of obsolete manufacturing capacity.

But today, the effectiveness of clever marketing and innovative financing are passing. Japanese manufacturers have demonstrated their ability to produce moderate volume products with quality at low cost through automation. American manufacturers are now faced with survival decisions, but they lack the trained manufacturing personnel to repair the leaky boat.

U.S. manufacturers have been slow to implement robotics because of a lack of trained industrial and manufacturing engineers. As manufacturing fell out of vogue, manufacturing managers became less visible and took less risk. Managerial and financial support for innovation decreased. And as the current generation of manufacturing managers approaches retirement, there is even less incentive to take risk. Precious few young trained managers are available to assume command.

High-tech phobia

How do current manufacturing managers hold the aggressive venture-capital-fueled robot industry at bay? Simply by demanding better technology and more risk-taking from robot vendors.

"If your robot could only. . ." are the famous words that strike terror in the heart of a robot salesman. "If robots could only see, think, hear, sense [pick any appropriate word], then we could install them without any trouble!"

And just when the hapless robot company brings out the ultimate robot product, the other shoe drops. "It's far too expensive to justify even at the cost of our labor," or "It's too complicated with all those features . . . how will we ever keep it running?"

The bottom line is that U.S. manufacturing management doesn't want to install robots.

[illegible] your local Control Data sales office or 800-258-4004 Ext. 37[illegible] for complete information.

Then feel free to travel outward. Into the [illegible] and beyond.

CONTROL DATA

The U.S. is the home of stand-alone robot companies, companies that have invested millions of dollars in the advancement of robot technology. This technology will benefit the next generation of robots, providing sensors, vision, hearing, touch and intelligence. Most of these companies are forced to continue to invest heavily in research and development, but none of them are able to show the profits necessary to attract much needed new capital investment.

In contrast, Japan and Europe do not have many stand-alone robot companies that must make strong profits to survive. The successful producers of robots there are companies that have developed robots for internal use or to exploit their basic products.

In Japan, a leading robot maker, Yaskawa, developed robots that use their electric motor and ball-screw products. Kawasaki licensed robot designs from Unimation (the American company that originated the robot) to manufacture their motorcycles and automobiles. Others, such as Hitachi Ltd., Nachi-Fujikoshi and Mitsubishi Electric Corp., manufacture robots that complement their existing automation products.

In Europe, Asea and Trallfa have developed robots to expand specific market segments they were already serving. Kuka, a German manufacturer of automation for the automotive industry, originally imported robots from Nachi-Fujikoshi of Japan but has since developed its own robots in conjunction with Siemens. Volkswagen developed robots for automobile manufacture. Renault of France also developed robots for its own use in automotive manufacture.

The need for robots is evident. Venture capitalists and investors have been willing to invest millions in robotics technology. There is no question that the robot revolution will happen in the U.S. — the only question is when.

Most successful U.S. robot installations have been initiated by senior management with the clout, financing and follow-through to make the technology stick. Currently, the largest installed base of robots is in the automobile industry. The robot revolution there is driven by the automobile industry's determination to survive. Some suppliers to the automobile industry have also taken the initiative and are robotizing.

The electronics industry is the newest robot growth market. Robots are used for printed circuit board

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 56 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

handling, disk drive assembly and clean room tasks. Robots used to assemble disk drives reduce the problems of contamination. Robots can also transfer printed circuit boards to and from workstations, into test machines and into automatic insertion stations. GMF Robotics of Warren, Mich., recently promoted a standard robot that could meet clean room requirements. Others have touted similar capabilities.

Separate paths

Robots and vision have been traditionally considered the same market segment. Now vision is receiving the same independent attention and promotion that robots received five years ago, creating a new independent market. Experts are predicting a billion-dollar vision market by 1990.

In addition to vision, tactile sense is another critical feedback that many believe robots must acquire to perform manufacturing tasks. Sensors are incorporated into robot grippers and tools to enable the robot to determine the object location or to adjust the force applied by the robot.

Use of robot transporters is also growing. These robots are like motorized carts and follow buried wires or transmitters strategically located along travel paths. Transport robots can be programmed to move materials in the factory between workstations and to and from inventory areas. In manufacturing, the robot transporter can augment or replace the forklift truck. In assembly, robot transporters can replace conveyors to move trays of parts and subassemblies to individual workstations.

The off-line programming of robots is still used primarily to study and simulate robot motion. Little progress has been made in expanding off-line programming's role to the rapid changeover of robot tasks or to increase the efficiency of programming. This delay has been in part because of the mechanical inaccuracies of robots and the unpredictability of their work environments. In the future, off-line programming is expected to be a standard feature of most robots.

The McDonnell Douglas Automation Co. (McAuto) group developed software tools for off-line programming of robots. McDonnell Douglas developed the Air Force's APL-based Robot Programming Language. And in an independent development, McDonnell Douglas introduced Place, a robot software simulation product used to simulate robot work cell set-up and evaluation. Place supports the geometrics of many of the current robot models.

The Japanese are not far behind in the high-tech robot race. Their success in implementing less sophisticated robots has fueled their sales, providing the income necessary to pay for new R&D.

In addition, the growing Japanese user base has increased their knowledge of robot applications technology, providing new and more cost-effective solutions to robot problems. Japanese manufacturers may already lead in robot product development. Advanced Japanese research is demonstrating robots that can walk, touch, feel, hold and even play.

Computer-aided design

Mainframe computers will be called upon to support robotics, and off-line programming may be one of the first areas. User data bases for specific robot geometrics, work-cell environments and associated machinery specifics will have to be maintained and updated routinely. Robot programmers will need to access CAD/CAM data bases for parts definitions, work-cell layout and tooling configurations.

The eventual efficiency and productivity of robots will depend upon their ability to communicate with the total factory and engineering environments. Just how these linkages will be made and the role of data processing in their implementation and execution remain to be defined (see figure).

To date, data processing has managed a large portion of the computer revolution. It has provided industry, government and education with billions of miles of printouts and uncountable pieces of information. What role will data processing play in the robot revolution? Stated another way, how will the robot revolution affect the data processing department?

One common definition of robots (see box on left) — "an easily reprogrammable,

Reach 66,000
Danish computer professionals.

Advertise in CW Communications' Danish publications and sell your products directly to Denmark's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, total data processing expenditures in Denmark for 1985 are expected to reach $1.8 billion. CW Communications covers the Danish market with these publications: *Computerworld Danmark, PC World Danmark* and *Run*.

Computerworld/Danmark serves 20,000 key EDP decision-makers throughout the Danish computer community. Each week *Computerworld/Danmark* covers new products and services, current applications and industry trends.

PC World Danmark is the monthly magazine that targets 12,000 IBM PC and compatible users and supplies them with first-hand information on the Danish PC market.

Run reaches 34,000 Commodore owners and potential owners in Denmark and Norway. Commodore is expected to grow at 40% per year through 1988. *Run* addresses the Commodore market with timely updates on hardware, software, and programs.

CW International Marketing Services makes advertising your products in Denmark, and around the world, easy. We have over 30 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

News for CAD/CAM users.

This modem will pay for itself in Three ~~four~~ months.
(Based on our new low price of [illegible].)

The incredible AJ 4048—now with error-free asynchronous transmission—will send your data over 2-wire dial-up lines at 4800 bps full duplex.

It's the first high speed full-duplex 4800 bps dial-up. The low cost alternative to leased lines. Operates in synchronous or asynchronous modes.

Big savings, fast payback.
If your company's current 1200 bps full duplex data transmission is around 12 hours per week, an AJ 4048 could pay for itself with connect time savings in about three months. And that's just the beginning.

AJ 4048-AEC automatically detects errors and retransmits data for asynchronous applications requiring total accuracy.

Write or call for our free cost-saving chart and our new catalog.

AJ ANDERSON JACOBSON

computer-controlled device that can physically manipulate its surroundings" — points out an important new idea. The robot is a means for the computer to interact with the physical world. Up until now, the computer has been providing information to humans via CRTs and the printed page. If humans were not there to use the information, computers would provide little impact on our world.

But robots provide a means for computers to perform physical functions in the real world. And because robots are run by computers and computers can be made to communicate with each other, we can imagine a mainframe computer directing a robot to replace its backup tapes, load fresh paper in its printers, retrieve media from storage and so on.

Data processing professionals who have chosen to make their livelihood with computers may be among the first to experience robots. The DP world may be one of the first to move from high tech to high touch.

In many ways, robotics has been a part of data processing for years. Devices such as automatic backup units, automatic microfilm systems, form bursters, mailing machines, laser printers and so on could all be considered dedicated robot devices. Not to stretch the definition of a robot, the main point is: "Who is more prepared to accept robotics than those who use the computer for their livelihood?" Perhaps data processing will play a key role in accelerating the acceptance of robots in U.S. manufacturing.

The decline of manufacturing during the past 30 years has created a shortage of skilled persons. Manufacturing has failed to attract the brightest stars and to provide them with a forum to display their talents. On the other hand, data processing has attracted many skilled and talented individuals. It has provided incentives and training that have created a significant body of talent with experience in computers and automation concepts. Perhaps DP will be called upon to assist manufacturing in utilizing robots.

One area where data processing may be called upon is in the implementation of statistical quality control. Statistical quality control is a new manufacturing buzzword. It means the collection and evaluation of component quality information as a means to control production quality. This function is often desired in real time. Data processing may be called upon to collect, process and disseminate information collected by robots, sensors and vision systems on the manufacturing floor.

A major obstacle is the lack of a means to communicate with robots and sensors on the shop floor. A great deal of attention is being given to local-area networks, communication protocols and integrated manufacturing. The lack of standards and the lack of understanding of the needs and problems of various groups may slow the process.

The latest buzzword of manufacturing is CIM, computer-integrated manufacturing. This concept has emerged as one means to explain how the various ingredients of the automation picture relate to each other.

Arthur D. Little, Inc. has broken the CIM concept into seven major technologies: computer-aided design (CAD); group technology; manufacturing planning and control system (MP&CS or MRP); automated materials handling; computer-aided manufacturing (CAM); robotics; computer-aided design (CAD) and computer technology. Each of these technology areas interact with others to form the whole CIM environment. CAM and MP&CS (MRP) are the most familiar segments of the seven. Each of these can be implemented on its own without the other supporting units.

However, significant additional productivity improvements should be realized when all elements are linked. Robotics is but one technology sphere, interfacing between CAD and CAM. The center sphere is computer technology, which links all technologies and performs a key function in the overall performance of the network.

At present, U.S. manufacturing appears to be enamored also of the automation of small-lot production. This type of automation is often called Flexible Manufacturing System (FMS). FMS requires sensors and feedback systems that measure and control the quality of the item being manufactured in real time. Much work has been done by the National Bureau of Standards to define the requirements of such systems and demonstrate their feasibility.

IN JULY
THE INFORMATION WORLD
WILL BE IN CHICAGO.

Where Will You Be?

In today's highly-competitive world, everyone needs an edge. And in today's highly-electronic world, that edge is often the most up-to-date information technology.

That's why both computer specialists and business professionals will be at the 1985 National Computer Conference. Where tomorrow's technology is happening today.

You'll find:

- The latest developments in hardware, software and services, focusing on applications.
- Over 700 major exhibitors showcasing the latest developments in the industry.
- 84 Technical Sessions on subjects such as Artificial Intelligence, Personal Computing and Networking.
- 27 Professional Development Seminars dealing with specific areas like Data Communications, Human Resource Management and Voice Processing.
- A Keynote Address, "Managing the Creation and Commercialization of Technology," given by Admiral B.R. (Bobby) Inman, President and CEO of Microelectronics & Computer Technology Corporation of Austin, Texas.
- Pioneer Day honoring the contributions of Argonne National Laboratory, Oak Ridge National Laboratory and the University of Illinois.
- And more!

INQUIRE™/Text:

Helps you find what's buried in your database.

You don't have to be an Einstein to realize that numbers are only part of the data your organization needs in order to be effective. As often as not, the information you need consists of a few key phrases buried inside a mountain of written documentation.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, it's easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a quantum leap in the quality and diversity of online information available for decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data—with an output of up-to-date, integrated management reports.

No wonder INQUIRE/Text users include some of the world's leading scientists and researchers —not to mention lawyers, librarians, engineers, corporate records managers, and entrepreneurs.

And no wonder more and more people everywhere are seeing text management as an indispensable element of the Information Center.

INQUIRE/Text. The only system around that can turn a mass of text into a source of energy.

For more information call or write Infodata Systems Inc., 5205 Leesburg Pike, Falls Church, Virginia 22041, telephone (800) 336-4939. In Virginia call (703) 578-3430. Telex: 899125

Standalones are done for.

JIM PITRE
PRESIDENT.

Dead as dodos. You know it. And I know it. If a PC can't communicate to another PC or mainframe, it doesn't have much of a future, right?

Well, to tell the truth, some *can* communicate. But *very* limited. Because their communication options are rigid and narrow. Worse, hooks and handles are lacking for customized use. And that's where we are today *except for Linkup System One:*

A communications system which allows IBM PCs to communicate with each other and to mainframes with great flexibility.

That being said, here's the good stuff:

Linkup System One: more than a single solution for mainframe terminal emulation. An intelligent PC Comm system, Linkup System One handles both synchronous and asynchronous emulations. That's a big claim, so let's get into details: On the synchronous side, 3270 SNA, 3270 BSC, 3770 SNA, 3780 BSC. Asynchronous: ATERM (Async Terminal), ABLOCK (Async Block Transmission) and VT 52/100.

So?

So multiple network access, menu-driven job scheduling, and the support of multiple unattended modes.

Now look at support for your particular job. Say you want to hold a mainframe session while executing DOS programs or multi-job transmissions. Well, you can. With unattended and automatic dial-up log-on answer. For example, with our 3780 you can transmit large blocks of data, error-free, with off-hours scheduling.

Suppose your problem requires hooks and handles for an application program. You'll find our interfaces simple to use, flexible, and in most popular languages. In a nutshell, they can take the communications grunt work away from the operator.

By this time we hope you are interested in us. Next step is to call us. Talk to us. The real question is *can we help you?* Truth is, in lots of other areas we can't. We specialize in just one small fraction of the area you work: PC communications. But in that area, we are the very best.

I guarantee it.

Extender for 1-2-3 unleashed

SANTA MONICA, Calif. — Software that permits Lotus Development Corp.'s 1-2-3 to address nearly 1M byte of memory on the IBM Personal Computer AT has been introduced by Uniform Software Systems, Inc.

The software, a $99 program called the Extender, reportedly lets 1-2-3 run in what is known as "protected virtual address mode" on the AT, giving it access to roughly 920K bytes of memory.

Though the Personal Computer AT has the potential to address up to 3M bytes of internal memory, 1-2-3 is currently limited to running within the maximum 640K bytes now addressable under IBM's PC-DOS. A new product from Intel Corp., the $599 Above Board, reportedly increases that limit by 4M bytes but only after an enhanced version of 1-2-3 becomes available this fall.

The Extender, a one-diskette program, will ship in July and works with existing versions of 1-2-3, according to Uniform Software President Peter Wensberg. The Extender, Wensberg said, could conceivably address more than 920K bytes; the limit is 1-2-3's, not the Extender's, he said.

With the protected virtual-address mode barrier broken, Wensberg said the path is clear for his firm to produce similar extension products for use with such programs as Lotus's Symphony or Ashton-Tate's Framework. The Extender, he argued, will come to serve as a bridge between the world of software for the IBM Personal Computer and the "new world of the [Intel 80286]-based computer" machines.

Uniform Software is located in Suite 514, 225 Santa Monica Blvd., Santa Monica, Calif. 90401.

Keyboard utility programs reduce work, aggravation

By Edward Warner
CW Staff

It may seem like a small matter, but who wants to hit a function key, an End key, the right arrow key and then the Return key when deleting one word from an on-screen document?

Tim Stein, vice-chairman of Forum/Nevison Executive Computing, a Boston-based personal computer training firm, certainly does not. That is one reason, he said, why he uses a keyboard utility program, Alpha Software Corp.'s Keyworks, on his IBM Personal Computer.

Stein, one of the beta users of Keyworks, said he uses the utility primarily to reduce to one or two keystrokes the multiple-keystroke commands required by the integrated software package he uses, Alpha Software's Electric Desk. For simplicity's sake, Stein converts the commands of Electric Desk's word processor to those used by the word processor with which he is most familiar, Micropro International Corp.'s Wordstar.

Like Stein, an increasing number of personal computer users are turning to keyboard utilities to create macros, which are small programs that reduce to only a few keystrokes a command or function that otherwise would take many. Keyboard utilities also allow keys to be redefined, permitting users to standardize command keystrokes across applications — a feature that, for example, lets "F1" equal BEGIN BLOCK commands in both Lotus Development Corp.'s 1-2-3

See KEYS page [illegible]

Keyworks, Superkey praised

By Edward Warner
CW Staff

Just as it is hard for one to talk about word processors without mentioning Micropro International Corp.'s Wordstar, the beta users of two keyboard utility programs find it hard to discuss the software they tested without mentioning Rosesoft's Prokey, one of the first such products and the current market leader.

Both beta users — one of Borland International's Superkey, the other of Alpha Software Corp.'s Keyworks — said they liked their respective packages best for the advantages they offered over Prokey.

Keyworks user Tim Stein, vice-chairman of Boston-based Forum/Nevison Executive Computing, said he used to use Prokey often, particularly to create macros for use with Lotus Development Corp.'s 1-2-3.

"I stopped using [Prokey] because it was so easy to screw up and so hard to change [macro] defines," he said. With Keyworks, he said, creating a macro is more foolproof. A pull-down menu lists Keywork's macro editing functions, while another lists the macros the user has created, he explained. In general, Keyworks "gives much more information about what's going on than Prokey," said Stein, who uses Keyworks to build macros for his word processing software, Alpha Software's Electric Desk.

Spreadsheet use: High anxiety?

MICRO BITS
Robert Firmin

Spreadsheet software has recently been the target of unprecedented attacks in the trade and business press. Perhaps never before has a specific software technology drawn so much critical attention from such leaders as *The New York Times* and *The Wall Street Journal.*

This time the press is right.

It has focused on the growing awareness in corporate America that extensive use of the spreadsheet as the basis for business analysis is fraught with danger. There are countless stories about business analyses that lead to erroneous advice and costly mistakes in organizations.

Published examples include the following:

- An error rate of "at least 20%" among the spreadsheets at a certain New Jersey-based Fortune 500 company.
- The firing of several oil company executives who recommended an acquisition that was a bad deal; in addition, a Big Eight accounting firm approved an erroneous spreadsheet supporting the recommendation.

The press is interested because there is a groundswell of concern among the millions of spreadsheet users who produce important analyses every day.

Businesses depend upon numbers but not just any numbers. They need and want numbers that are valid, prepared quickly and easily understood, even when analyses get complex. The press stories highlight what veteran users already know: that the spreadsheet approach fails to meet these needs.

Spreadsheet users are presented with a curtain of numbers that hides all of the reasoning used to arrive at those numbers. The user has to begin the analytic process in a report mode, weave relationships in the report mode, document in the report mode and, finally, report numbers with a very low level of confidence.

Or as Lotus Development Corp. founder Mitchell Kapor said in the November 1984 *Harper's*, "You can just randomly make formulas, all of which depend on each other. And when you look at the final results, you have no way of knowing what the

P-CAD interfaces out for design transfer

LOS GATOS, Calif. — Personal CAD Systems, Inc. (P-CAD) has announced four interfaces that reportedly allow circuit designs constructed on its Engineering Design Capture software for personal computers running on AT&T's Unix, IBM's PC-DOS and Microsoft Corp.'s MS-DOS to be extracted and transferred to a variety of computer-aided design and computer-aided engineering software packages.

The interface packages reportedly translate the net list, or circuit routing, information from a P-CAD design data base into a format that can be read by systems running Scientific Calculations, Inc. Scicards, the Regents of the University of California's Spice and Motorola, Inc.'s CAD software.

Another interface package is said to translate net list information into an Ascii format, which can then be manipulated into a form readable by other systems.

With the interfaces, P-CAD users reportedly can upload designs to a variety of CAD environments, including full fault simulators, physical layout stations and manufacturing control systems, the vendor said.

The Scicards interface reportedly translates three types of schematic components, packing information and net connectivity functions from a P-CAD data base into a format that can be read by the Scicards software.

The Spice interface reportedly allows net list information to be read by Meta Software's Hspice software and includes a symbol library of primitives for creating circuit schematics and element types supported by Spice.

The Motorola interface program is said to translate P-CAD schematic data bases into Logcap, a format compatible with Motorola's semicustom CAD system.

An Ascii program reportedly allows schematic capture or physical layout data bases to be used as source files.

All interfaces are priced at $500, according to the vendor.

P-CAD is located at 981 University Ave., Los Gatos, Calif. 95030.

Calif. considers micro buyer protection bill

SACRAMENTO, Calif. — Personal computer advertisements that promise one thing and deliver another could become a thing of the past in California if the California State Assembly enacts a bill under consideration.

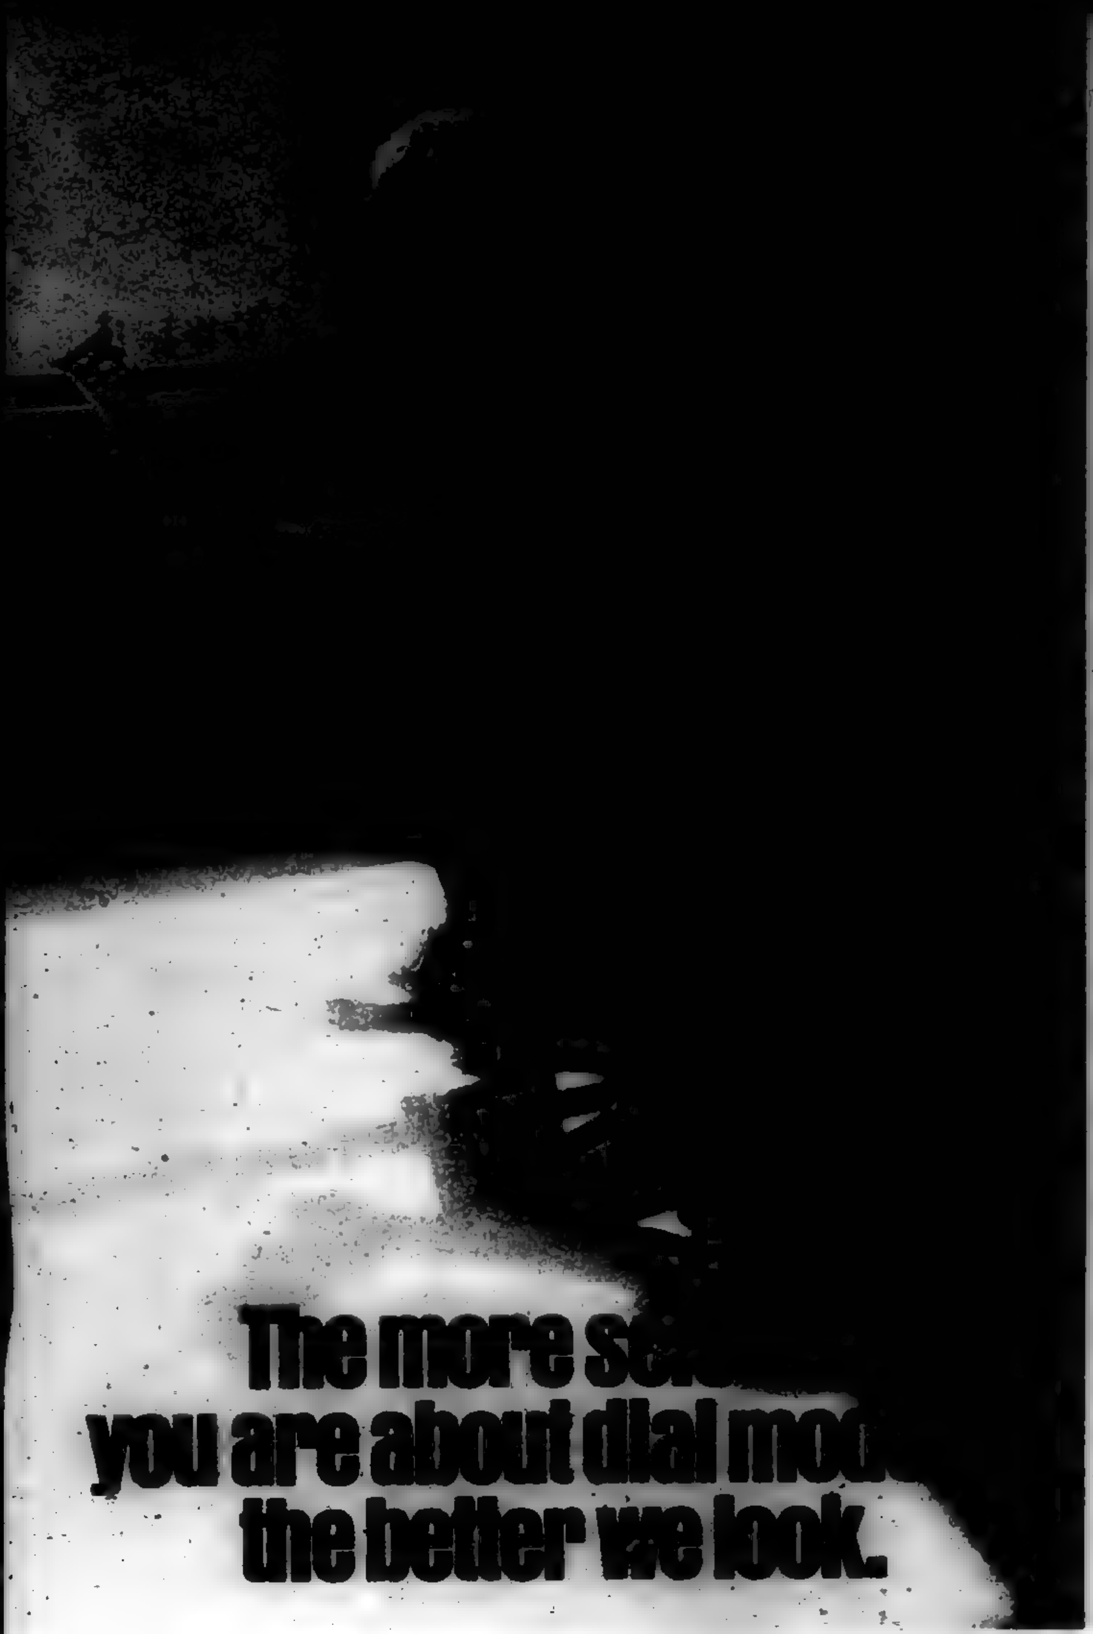
The Computer Buyer's Protection Bill, introduced by State Assemblywoman Gloria Molina of Los Angeles, would make both computer retailers and manufacturers liable to civil suits for breach of warranty should they engage in false advertising of their products. It would not provide criminal penalties, however.

The bill, which would also cover personal computer software and related hardware such as modems, was reported to be out of the assembly's Consumer Protection Committee last month, and a vote by the full assembly, the equivalent of a state house of representatives, is expected shortly.

Molina was inspired to introduce the bill after she purchased an Apple Computer, Inc. Lisa personal computer, according to her legislative aide, Alma Martinez. At that time, Martinez claimed, both the dealer and Apple were promising the addition of a mail-merge feature in the next enhancement of the Apple Lisawrite word processor bundled with the machine. The mail-merge feature was never added, Martinez said.

Apple Computer spokeswoman Rene Rodrigue said she did not know whether Lisawrite had ever been enhanced to offer mail merge but that the Lisa, or Macintosh XL as it is now known, can do mail merge using Keystroke Data Base software from Brock Software Products, Inc. Rodrigue declined to comment on Apple's reaction to the proposed legislation. Apple has announced that it will cease production of the Macintosh XL this year [CW, May 6].

Since the incident, Molina has "gotten a lot of letters" from people who have said their personal computers had not performed as promised. The bill would make any personal computer product's advertisement or brochure an expressed warranty for the product's performance, she said.



Talk to most so called "networking companies" about point-to-point dial networking and you'll probably get a big song and dance, but very few products.

Codex, on the other hand, offers a complete repertoire of dial modem solutions. To meet any need.

We offer a full line of 2400 bps modems, proven in benchmark studies to be more accurate, more reliable over degraded lines than any other modems on the market.

We offer Bell-compatible and international modems.

We even offer modems that have a sophisticated error-correcting feature.

The fact is, we offer the most complete dial modem line in the industry.

Which means one thing: when you talk to a Codex applications expert you're talking to a person who can be totally objective in recommending products for your environment.

Maybe that's why in a recent industry wide survey we were chosen as the preferred modem supplier.*

Maybe that's why you should be talking to us, too.

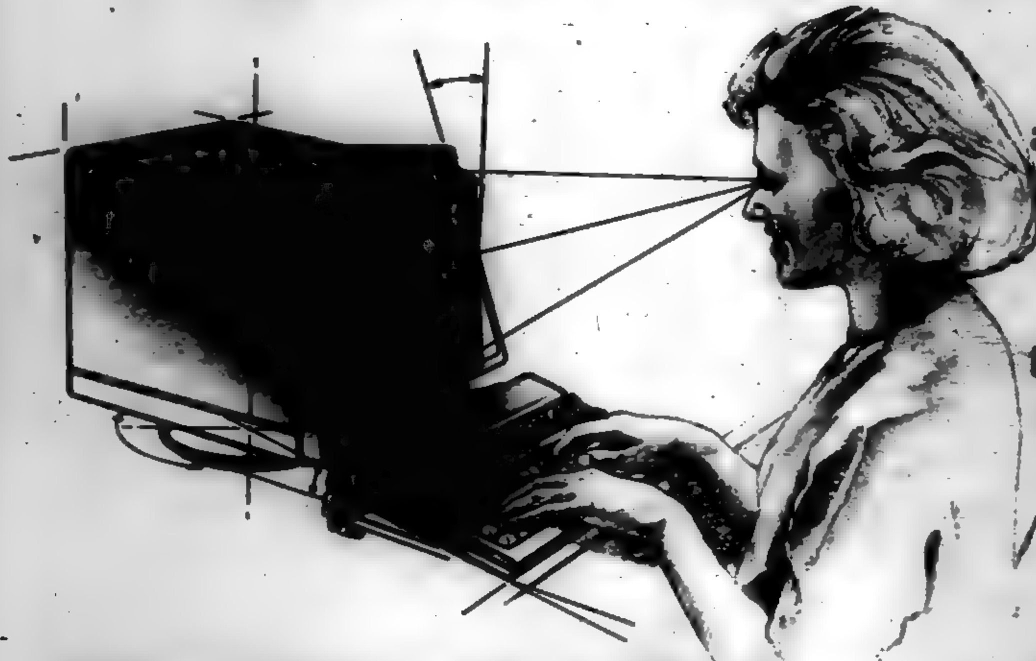
At NCC, see us at the Motorola Information Systems booth #5541.

We couldn't improve on you. So we improved on your terminal.



You're as good as you can be, just the way Nature made you. Unfortunately, Nature doesn't make computer terminals. So at Hewlett-Packard, we've been making improvements on terminals, to make them work more agreeably with you.

Our newest display terminal, the HP2392A, is a case in point. It has an adjustable keyboard, a screen with an integral tilt, and a monitor that can revolve.

So your people won't have to adjust, tilt, or revolve to use it.

The keyboard can be angled to lay flat on a desk, and it has contoured keys arranged in clusters, to sit easily beneath the hands. We also made it detachable, to sit easily in the lap.

And all that is just with the unit turned off. Turn it on, and you'll see the famous HP display screen, with characters that are sharp, clear, and distinct.

What's more, the HP2392A has ANSI, so it's DEC-compatible.

All for only $1375.*

The HP2392A. The terminal that works with people.

Find out more. Just call your local HP sales office, listed in the white pages. Or write to Terry Eastham, Hewlett-Packard, Dept. 003215, 8020 Foothills Boulevard, Roseville, CA 95678.

CDBC adds mainframe link for IBM micros

MINNEAPOLIS — Control Data Business Centers, Inc. (CDBC) has introduced software that reportedly will link the IBM Personal Computer and Personal Computer XT with CDBC's mainframe-based services.

The software, called Orchestrator, will permit a firm to use the Personal Computer to access its data at the CDBC service bureau, according to the vendor.

CDBC provides such services as payroll check processing, and users will be able to download to their Personal Computer data such as payroll tax filing, tax change and benefits information. Users may then manipulate the data using such programs as Lotus Development Corp.'s 1-2-3 and Ashton-Tate's Dbase II, the vendor said.

No need for mainframe

By relying on the CDBC, a vendor spokesman said, small to mid-size firms can have a data base that can be accessed by all of their Personal Computer users, and they would not need to purchase their own mainframes. Firms with a mainframe in place may elect to have CDBC process their payrolls, a popular feature of the service, according to the spokesman.

Orchestrator reportedly includes a telecommunications program, user security software, four data entry modules, automatic file translation, backup and restoration programs and printer support software, among other features. It requires IBM's PC-DOS 2.0 or later, 320K bytes of memory, a monochrome or color monitor and an RS-232 serial port.

The software is priced at a one-time license fee of $3,600 or a monthly fee of $150. Other pricing options are said to be available. There is a monthly maintenance fee of $35.

The CDBC service bureau itself sets the prices for its payroll processing service at an average of $350 a month for a company with 100 employees, and has three pay periods per month.

CDBC is located at 500 W. Putnam, Greenwich, Conn. 06836.

IBM cuts PCjr, portable micro, monitor prices

BOCA RATON, Fla. — IBM cut prices on its Portable Personal Computer, PCjr and PCjr Color Display.

The cost of the Portable Personal Computer with 256K bytes of internal memory and one diskette drive dropped from $2,595 to $1,950. The price of a dual-floppy-drive version was reduced from $2,895 to $2,250.

A PCjr with 128K bytes of internal memory and one floppy disk drive will cost $725, down from $999. The cost of the PCjr color monitor dropped from $429 to $399.

File transfer software out for IBM micros

SAN JOSE, Calif. — Forte Communications has announced micro-mainframe file transfer software that is reportedly compatible with IBM's 3270 Personal Computer host file transfer program. The Forte product is said to allow 3270-PC users to upload and download IBM's Professional Office Management System from IBM mainframes.

PJ/FTS comes bundled with Graph/FTS, which reportedly allows users to transfer IBM S3G mainframe graphics files to the 3270-PC.

Forte's PJ/FTS reportedly requires use of the Forte PJ 3278/79 emulation card and, to utilize its graphics functions, the Forte's IBM 3279 S3G graphics emulator card. It also requires IBM's MVS/TSO, VM/CMS or CICS operating systems running on the host.

PJ/FTS and Graph/FTS are available for $1,000 for a corporate single-site license and $5,000 for a corporate multiple-site license, according to the vendor.

For additional information, Forte Communications is located at 2205 Fortune Drive, San Jose, Calif. 95131.

SOFTWARE

■ **Real-Time Computer Science Corp. (RTCS) has released configurable versions of its real-time operating systems, PC/RTX and AT/RTX, which allow users to write their own IBM Personal Computer XT or Personal Computer AT device drivers for real-time applications.**

The PC/RTX and AT/RTX operating systems are implementations of Intel Corp.'s IRMX 86 real-time multitasking operating system specially configured to run on the IBM Personal Computer, Personal Computer XT and AT.

The RTX-C products are the configuration source files and device driver libraries contained in a file, which includes the object modules for all drivers and instructions for specifying device unit information

THE MOST VALUABLE EQUIPMENT WE OFFER IS FREE.

Getting the right data processing equipment shouldn't be costly. And USL Data Systems is equipped with applications experts who make sure of that. Absolutely free.

When you rent, lease or purchase, there is no risk of getting the wrong equipment. Our applications experts make sure you get the system that's exactly right for you. And we don't just provide a limited number of products. We have all the leading brands in stock for immediate delivery. Hardware and Software.

And because you're renting or leasing from USL Data Systems, there's no risk of your system becoming obsolete. No risk of over expending your capital. We offer the most flexible financial options in the business.

Short term, long term, lease-to-own, outright purchase, and more. Plus top service and support, including a toll-free hotline.

Phone (800) 835-2246, ext. 184 and ask for the applications expert nearest you.

No-Breakthrough Technology from LeeMAH.

Computer crime is a real threat. Because nothing can damage your business faster than lost or stolen data.

Which is why you need a Secure Access Multiport (SAM) System from LeeMAH.

SAM Cuts Off Unauthorized Access.

Thanks to a very simple process, your data is perfectly safe.

You just phone in and enter a personal location code. SAM then disconnects the line and calls you back.

It stops the home hacker cold. Because SAM can only call back a terminal if the phone number is stored in memory.

And SAM doesn't acknowledge phone calls with tell-tale tones. So if someone's randomly dialing numbers to find a computer, they'll never know if they've found one.

Best of all, SAM can disconnect the line even when the caller refuses to hang up. So no one can ever enter a stolen access code.

All of which adds up to a system that's virtually impenetrable.

Keeps Track Of Every Call.

SAM even helps with the trickiest type of computer crimes.

Employees who attempt to break into your data base, industrial spies, or overzealous competitors.

It gives you an audit trail. With the exact dates, times, durations and identities of every authorized user who's called your computer. Plus a record of incompleted calls, or illegal attempts to gain access.

So you get double protection against theft.

A Record That Couldn't Be Better.

SAM systems are already protecting more than 6,000 computer ports around the world.

With no known breakthroughs.

That's why LeeMAH is the leader in call-back security systems. And why hundreds of companies turn to us for data protection. We're not just more economical, we're more effective.

After all, no-breakthrough protection does more than protect your data.

It protects your business.

LeeMAH Datacom Security Systems are available for immediate delivery.

MICROCOMPUTERS

Continued from page 79

blocks, the vendor said.

The PC/RTX operating system for the Personal Computer and XT costs $995 and the AT/RTX for the Personal Computer AT costs $1,495. The PC/RTX-C I/O library costs an additional $2,000 and the AT/RTX-C costs an additional $2,795.

RTCS, Unit E, 1390 Flynn Road, Camarillo, Calif. 93010.

■ Decision Resources, Inc. has announced enhanced versions of its business graphics software for the IBM Personal Computer, Personal Computer XT, AT and compatible machines.

Chart-Master 6.1 includes Datagrabber, a capability that allows users to bypass Data Interchange Format files and move directly into the spreadsheet to extract data for use in line patterns and axis and pie charts, the vendor said. The program includes access to two new fonts.

Chart-Master provides users with customizing options like hatch and line patterns, colors and axis control. Text can be underlined, italicized or justified in 16 different type sizes.

New graphics and fonts have also been added to Sign-Master 5.1, a text graphics product for slide presentations. The product allows users to change the size, color and position of data for the slide.

The products will work with IBM's recently announced Proprinter and Color Jetprinter, according to the vendor.

Available this month, Chart-Master 6.1 and Sign-Master 5.1 cost $375 and $245, respectively.

Decision Resources, 25 Sylvan Road S., Westport, Conn. 06880.

■ Hale Systems, Inc. has announced financial management modeling software that runs in conjunction with Lotus Development Corp. 1-2-3 on the IBM Personal Computer, Personal Computer XT or AT.

Financial Institution Planning System (Fips) is reportedly an asset and liability management model that allows financial institutions to develop, test and revise operating strategies based on data from 1-2-3 spreadsheets.

The software is said to integrate long-term strategic planning in short-term budgeting, produce budget-to-actual variance reports, generate earnings projections and test many different expansion and merger scenarios.

Fips is said to include gap analysis and predefined color graphics capabilities. According to the vendor, it also features report generating capability in detailed or summarized formats. The product requires 512K bytes of memory to run in conjunction with 1-2-3.

Fips costs $9,500.

Hale Systems, 1044 Northern Blvd., Roslyn, N.Y. 11576.

■ Deerasoft, Inc. has announced Version 2 of its menu system software for the IBM Personal Computer, Personal Computer XT and AT and compatibles running under either IBM's PC-DOS or Microsoft Corp.'s MS-DOS operating systems.

Features added to the Magic Menu program include configuration, user file maintenance, menu editor and menu display functions. An audit trail analyzer program is available at an additional cost.

The package requires 128K bytes of memory, a floppy or fixed disk and Version 2 or later of the operating system.

Magic Menu costs $99.

Deerasoft, P.O. Box 1966, Melbourne, Fla. 32901.

■ Software Synergy, Inc. has introduced software that reportedly enables IBM Personal Computers and compatibles with 256K bytes of memory and IBM's PC-DOS Version 2 or later to communicate with mainframes, minis and microcomputers as well as with on-line information services.

The system must include an internal or external mode, one double-sided diskette drive, an 80-col. monochrome or color monitor and an asynchronous I/O board with appropriate cabling.

The software, Respond/Async, reportedly emulates the terminal features of the Digital Equipment Corp. VT100, VT102 and VT52; the IBM 3101 Model 10; and Hewlett-Packard Co.'s 2621B, 2622A and TTY.

It allows micros to access subscriber services like Source Telecommunications Corp.'s Source; Official Airline Guides, Inc.'s Official Airline Guide; Dow Jones, Inc.'s Dow Jones News/Retrieval service; and Compuserve, Inc.'s Compuserve.

The package costs $175.

Software Synergy, 466 Main St., New Rochelle, N.Y. 10801.

■ Postley Software, Inc. has announced data base management and report generating software for the IBM Personal Computer, Personal Computer XT and AT.

DBS/Experience is said to contain on-screen Help instructions on all menus to lead users through procedures such as setting up files and inserting and retrieving information. The product is said to provide displays or reports from existing files or subsets of data files.

The software reportedly can perform computations on stored data and summary calculations. Reports are said to be automatically formatted for screen or printed presentation.

DBS/Experience requires IBM's PC-DOS Version 2 or later and resides in 64K bytes of memory.

DBS/Experience costs $345.

Postley Software, 6855 Hayvenhurst Ave., Van Nuys, Calif. 91406.

■ Coefficient Systems Corp. has announced a version of its Vterm software for the IBM Personal Computer line and compatibles.

The Vterm/4010 is said to combine Tektronix, Inc. 4010 terminal emulation, Digital Equipment Corp. VT100 terminal emulation, four error-correcting file transfer protocols (including Kermit) and communications capabilities up to 9.6K bit/sec.

The package is said to support Microsoft Corp.'s mouse, programmable softkey macros, setup screens, on-line Help facilities and automatic dialing.

The file transfer system that includes Kermit supports wild card transfer, server commands, data compression and command macros, the vendor said.

Kermit requires host software available from Columbia University.

The Vterm/4010 emulates 132-col. display with horizontal scrolling and can reportedly redisplay data that has scrolled vertically off the screen.

The package is priced at $249.

Coefficient Systems, 611 Broadway, New York, N.Y. 10012.

Novell introduces the best way to improve your network reception.

In a relatively short time, the local area network (LAN) market has attracted a host of suppliers. Each has a LAN system to sell. And each is fighting for a proverbial piece of the LAN pie.

Amid all those LAN contenders, only one company is out to make all LAN systems perform better. Only one company offers high-powered LAN operating system software that improves the performance of every major LAN system on the market. Only one company is finishing the job the other LAN makers begin.

The company is Novell. The company's solution is NetWare.

NetWare performs.

How good is NetWare? In recent benchmark tests conducted by Novell as well as Belmont Laboratories, NetWare significantly improved the performance of every LAN system tested.* In fact, NetWare currently runs on 24 different LAN hardware systems, outperforming the original software for every one.

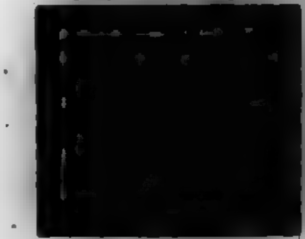
Serving all LANkind.

Whichever LAN hardware you choose, NetWare is the LAN software designed to get the most out of your network. When it's time to improve the reception your network gets from those who use it every day, plug into NetWare. It's from Novell, the people dedicated to serving all LANkind.

For more information, call or write Novell, Inc.
1170 N. Industrial Park Drive Orem, Utah 84057
(801) 226-8202

*LAN Benchmark Report, May, 1985, Novell, Inc. and "Software, Not Hardware Key to LAN Performance," *PC Week* 1/15/85.

NOVELL

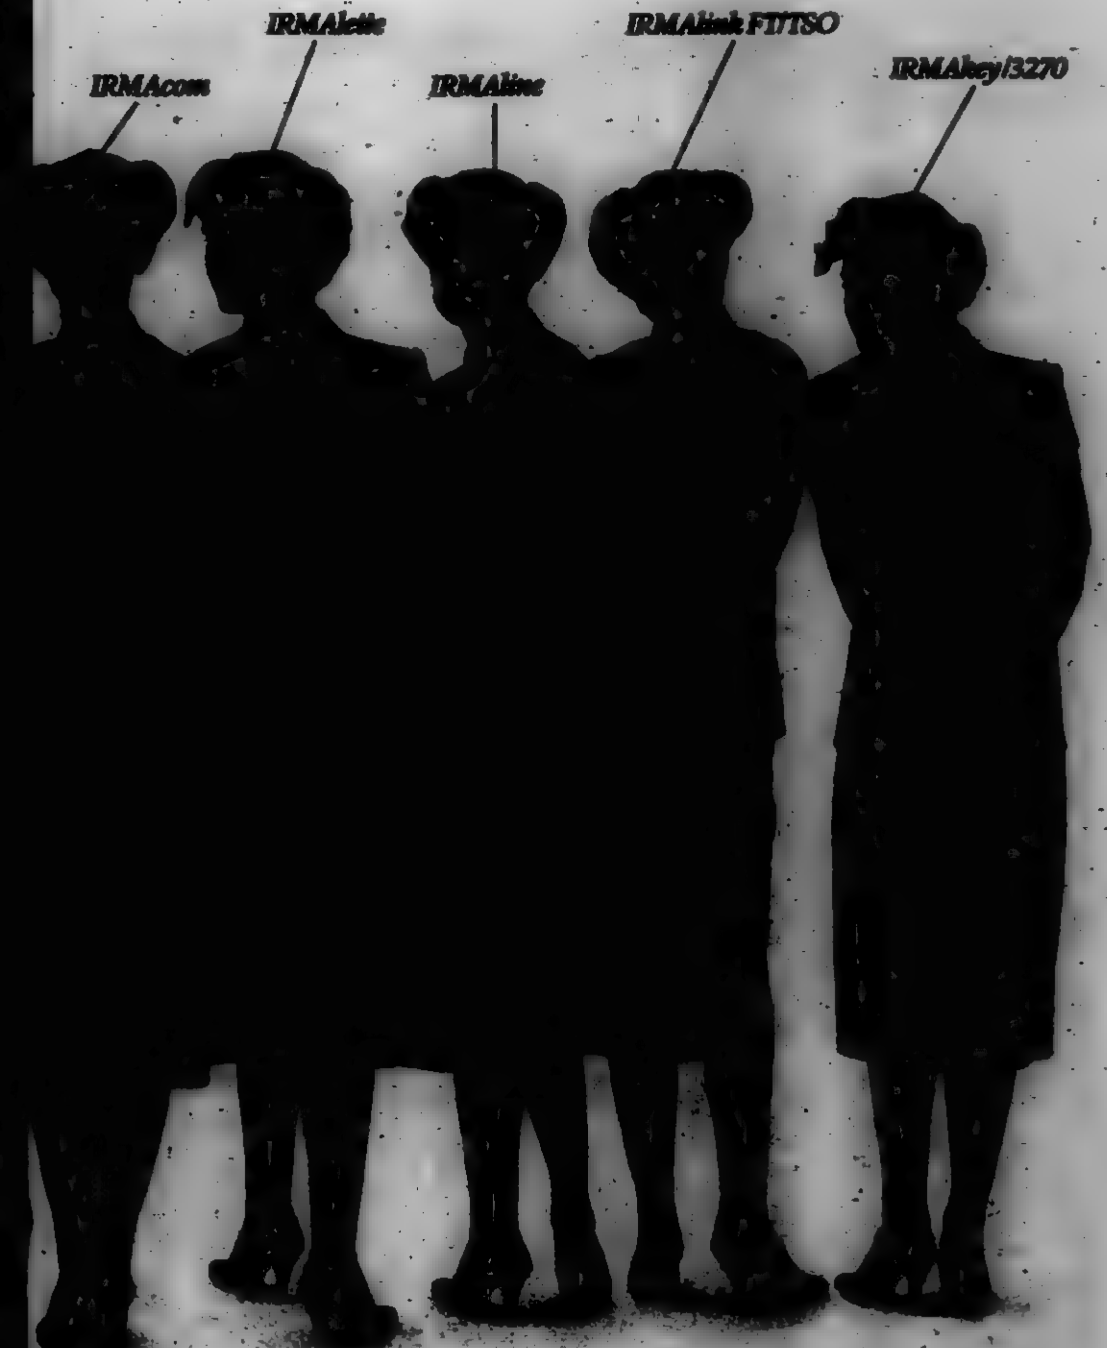


Now that you've formed a lasting relationship

With more than 100,000 boards installed so far, IRMA™ has become the standard micro-to-mainframe link in the 3270 environment.

That's just the kind of success that gives a company a lot of big ideas.

Like IRMAline™ and IRMAlette™, remote PC-to-mainframe links that work with the ease of IRMA. IRMAprint™, a 3287 emulator. IRMAcom™, a board that will emulate a 3270 controller. IRMAkey/3270™, a keyboard that puts PC and terminal functions together. And IRMAvision™, a new monochrome display adapter for any IBM personal computer. When used with IRMA, it emulates a 3278 terminal mod two through five.



with IRMA, isn't it time you met the family?

With that kind of exciting hardware, we wouldn't think of disappointing you with any of our new software products.

For example, IRMAlink FT/TSO™ and FT/CMS™, two host-based file transfer systems. And the new IRMAlink FT/3270™, software supporting IBM's PROFS and PROFS PCC.

All compatible with IBM PCs, XTs and ATs.

Find out more. Just call 1-800-241-IRMA. Or Telex 261375 DCA UR.

TOOLS

from page 81

■ Applied Business Technology Corp. has announced the enhancement of its Project Manager Workbench software for the IBM Personal Computer line.

According to the vendor, Release 2.1 is also compatible for use on the Digital Equipment Corp. Rainbow microcomputer.

The enhanced project reportedly includes improved display capability for multiple projects on a Gantt chart and the ability to preview onscreen reports before they are saved on disk.

The release is said to include user-assigned priority in automated scheduling and to handle up to 200 resources or tasks per project, depending on system memory capacity.

The advanced version of Release 2.1 is also said to integrate text processing with two independent windows for cutting and pasting.

Project Manager Workbench Version 2.1 runs on the IBM PC-DOS operating system and resides in 384K bytes of memory.

Project Management Workbench is priced at $750 for the standard version and $1,150 for the advanced version.

Applied Business Technology, 6th Floor, 365 Broadway, New York, N.Y. 10012.

■ Beacon Hill Software Corp. has announced three data management software programs for the IBM Personal Computer and compatibles and machines under AT&T's Unix.

The DP Workbench (DPW) — written in C — is said to manage data stored in DOS files and to be capable of being ported to any machine that has a C compiler. It reportedly enables users to reformat, combine and extract information from data files. It can be used to manage a data base of DOS files and, in conjunction with a data base management system, to create and reformat data files for input to the DBMS, the vendor said.

DP Form is a forms manager, and DP Report is a report generator; both reportedly work in conjunction with the DPW or can stand alone.

The DPW package costs $99; DP Form and DP Report cost $49 each.

Beacon Hill Software, Suite 1409, One Devonshire Place, Boston, Mass. 02109.

■ Persoft, Inc. has introduced Smarterm 220 software, said to permit the IBM Personal Computer to emulate a Digital Equipment Corp. VT220 terminal fully supporting DEC's A-to-Z and other DEC software packages.

Smarterm 220 is also said to be able to transfer Ascii and binary program and data files between the Personal Computer and a host system. It offers all of the features of the VT220, including full keyboard emulation, English language setup mode, programmable function keys and multinational character sets.

The software is priced at $195. Existing Smarterm 100 users can upgrade for $75.

Persoft, 2740 Ski Lane, Madison, Wis. 53713.

■ Micro-MRP, Inc. has introduced its Management Performance Module for use with its "Max, The Production Manager," a manufacturing resource planning system for the IBM Personal Computer line.

The Management Performance Module reportedly analyzes and summarizes quantities and costs of surplus inventory, purchase orders, material requirements, work order activity and all inventory transactions. It also analyzes shop order shortages and the timeliness of vendor deliveries and work order completions.

The module costs $2,000.

Micro-MRP, 1065 E. Hillsdale Blvd., Foster City, Calif. 94404.

SYSTEMS

■ Docutel/Olivetti Corp. has unwrapped its M24 personal computer, said to be compatible with the IBM Personal Computer.

The M24 includes a serial port, parallel port, clock and calendar, monitor, graphics card for alphanumeric and graphics information and seven expansion slots.

Users may select either two 360K-byte floppy disks or one 360K-byte floppy disk and one 10M-byte hard disk. The monitor, available in monochrome or color, features 640- by 400-pixel resolution.

Introducing The Single Solution To Many Problems That Can Tie Up Your Personal Computer.

Prices range from $2,745 for floppy drives, 128K-byte memory and monochrome monitor to $5,570 for a hard-disk model with 256K-byte memory and color monitor.

Docutel/Olivetti, 9615 Highpoint Drive, Irving, Texas 75062.

■ Leading Edge Products, Inc. has announced a model of its Leading Edge Personal Computer that reportedly is compatible with the IBM Personal Computer.

Model D features 256K bytes of random-access memory (RAM), expandable to 640K bytes of RAM; four expansion slots; two 5¼-in., double-sided, double-density disk drives; an Intel Corp. 8088 microprocessor; parallel port; and serial port.

The product includes a 12-in. green or amber screen and a Hercules Computer Technology graphics card that supports high-resolution monochrome or color output.

Bundled software consists of Microsoft Corp.'s GW Basic and MS-DOS operating system.

The product sells for $1,495.

Leading Edge Products, 225 Turnpike St., Canton, Mass. 02021.

■ Cado Systems Corp. has added two workstation models and an entry-level system to its line of Tiger ATS multiuser computers.

The Tiger DS/PC and the Tiger DS/XT workstations will function as decision support workstations in any Tiger ATS system or can be used as stand-alone desktop computers, the vendor said.

The DS/PC uses the 16-bit Intel Corp. 8088 chip and provides 256K bytes of memory and two 360K-byte diskette drives. The DS/XT substitutes a 10M-byte Winchester hard disk drive for one of the two diskette drives.

Both models incorporate Microsoft Corp.'s MS-DOS operating system, are available with either color or monochrome monitors and include graphics and real-time clock capabilities.

The basic Tiger DS/PC costs $2,960, and the DS/XT starts at $4,690. Prices include Contel Cado's Tiger-Link software, which allows the workstation to emulate the company's C-300 terminal and which accepts file transfers from Tiger ATS systems.

The company also announced the Tiger ATS8 entry-level system, which supports one to eight users. The system is compatible with other Tiger ATS computers that support from 16 to 64 users.

The basic model consists of a four-port processor module using an 8-MHz Intel 80186 microprocessor, 256K bytes of memory, a 10M-byte Winchester hard disk and either a 1.2M-byte floppy disk or a 20M-byte streaming tape cartridge for backup and a Cado C-301 word processing terminal.

The unit costs $7,650.

Cado Systems, P.O. Box 3759, 2055 W. 190th St., Torrance, Calif. 90510.

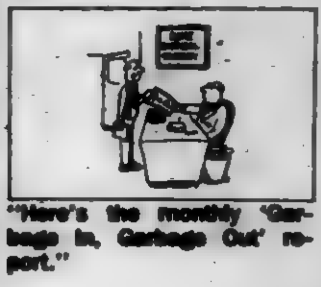
■ Innovative Electronics, Inc. has announced its Innovative Factory Data Collection System, which reportedly provides records of time and attendance, inventory control, work in process and job tracking.

The system, which runs under IBM's PC-DOS, reportedly also provides shipping and receiving control, quality control and customer chargeback functions. It operates in stand-alone mode or in conjunction with an IBM Personal Computer, a Digital Equipment Corp. VAX-11/780 or (with the addition of Innovative's MC80 protocol converter) with an IBM System/36 host computer.

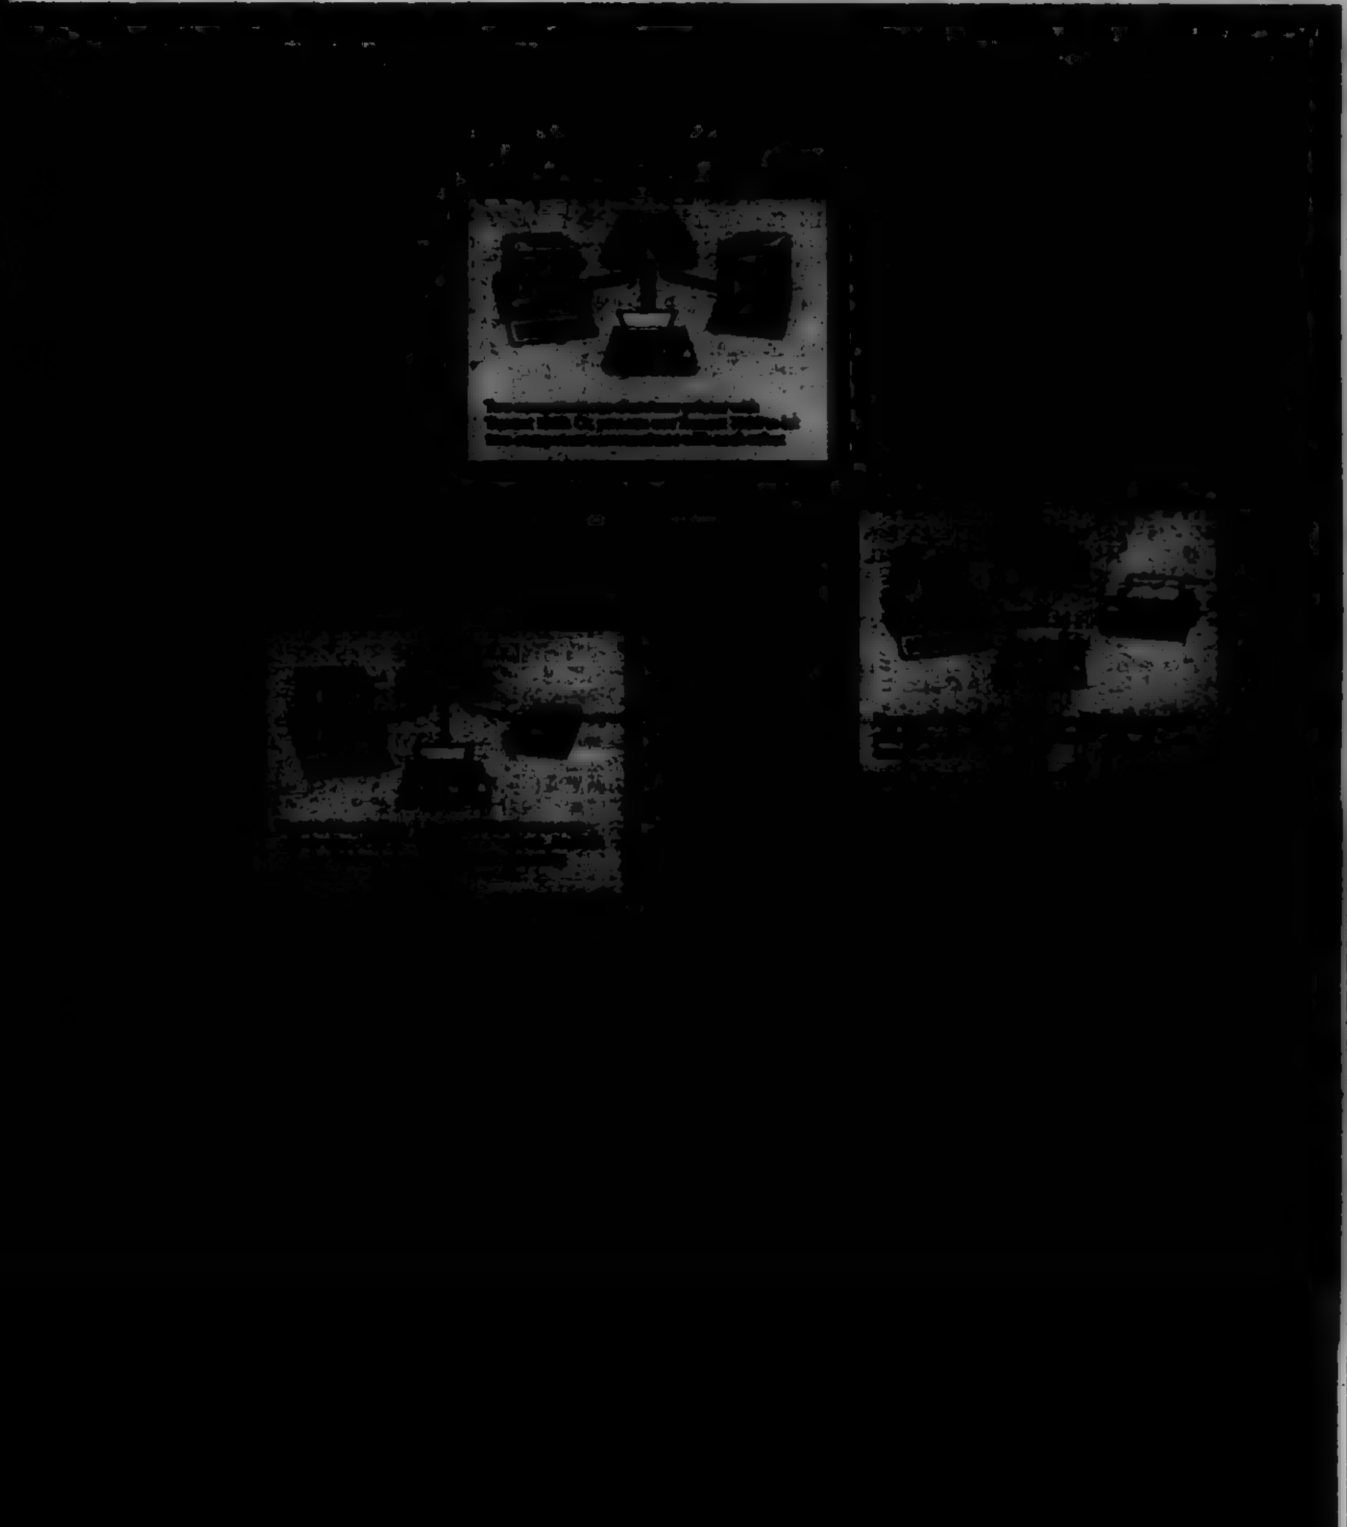
The basic system includes Innovative's Netmaster unit, 10 of the company's Transactor terminals with bar code wands, custom software, host communications software and two 360K-byte disk drives.

The basic system costs $35,000. A similar system with one 10M-byte hard disk and one 360K-byte floppy disk costs an additional $4,000.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.



"Here's the monthly 'Garbage In, Garbage Out' report."



Run with the fast crowd

FAST PERFORMANCE
In the race for fast execution speed, Philon FAST/Compilers are the runaway leaders in the UNIX™/68000 waters. With the benchmarks to prove it. That's why so many top computer manufacturers are already in our corner. They didn't need to think twice about the Philon advantage.

FAST FLEXIBILITY
Not just top speed. But true portability from machine to machine. Plus compatibility to speed up programs written under less efficient compilers. How? Through a complete suite of languages, utilizing a common intermediate code and hardware-independent modular architecture so unique, it's patent pending.

FAST CASH
Now you're thinking fast, and you've realized the profit edge we can give your business. Your programs will be faster, with greater sales potential. And you'll be far more productive, with lower development costs and the ability to move existing applications to a broad range of popular machines. You can even run on VAX™ under ULTRIX.™

Want more? Philon is fast becoming famous for thorough, clearly-written documentation. A customer support program unmatched in the business, including toll-free FAST/HELP for immediate, professional response to your problems. And all Philon products are tested under an exhaustive Quality Assurance program that ensures compiler reliability.

FAST INFORMATION

KEYS

from page 75

and Wordstar. Also called macro processors, the utilities reside in memory alongside an application, bringing to that application macros that have previously been written or those the user creates while the application is running.

Because these utilities work so closely with the keyboard, the greatest stumbling block can come when they attempt to interact with a program such as Microsoft Corp.'s Word, which is said to take over the keyboard. No keyboard utility is said to be able to work with Microsoft Word 1.0, for example, but all are supposed to be able to work with Word 2.0, the latest version of that word processor.

Since 1979 when Software Research Technology, Inc. introduced the first keyboard utility, Smartkey II, sales for such products have grown steadily. The current market leader in the Microsoft MS-DOS-based world is said to be Rosesoft's Prokey and, until last month, few other products had stepped forth to challenge its domain.

However, Borland International began shipment of its Superkey in May, and Alpha Software planned to deliver Keyworks last week. Both run under MS-DOS. Not to be outdone, Rosesoft also began shipment late last month of an enhanced version of Prokey.

Unlike other keyboard utilities, though, Keyworks reportedly will permit the user to use macros to change entirely the interface that an application presents to the user. In the words of Alpha Software Executive Vice-President Selwin Rabin, Keyworks' ability to let the user create his own pop-up menus will let him "make a program like [Micropro International's] Wordstar look like it was written for the [Apple Computer, Inc.] Macintosh."

Both the $89.95 Keyworks and the $69.95 Superkey reportedly offer data encryption in addition to their macro-generating capabilities. Superkey boasts two types of encryption: a proprietary method and the U.S. government's Data Encryption Standard.

The ability to create macros, though, is still each package's prime feature. Keyworks and Superkey both have pop-up menus of their macro editing functions and are compatible with most popular applications software.

Superkey also claims compatibility with Prokey macros — a feature that would permit it to interact with macros already created by any of the 50,000 copies of Prokey in use.

> *'If you've never used a macro processor, I think you're missing out.'*
>
> — Conrad Kageyama
> electronic bulletin
> board operator

The latest release of Prokey, the $129.95 Version 4.0, meanwhile, trumpets its ability to execute macros using English-language commands or user-created abbreviations. A user who wanted to find IBM's closing stock price, for example, could simply type "IBM," and the macro he had already created would log on to the Dow Jones News/Retrieval service and display the stock quote.

Despite the number of new or enhanced offerings, market analyst Mary Ellen Dick of the research firm Software Access International, Inc. does not believe that demand for keyboard macros extends beyond sophisticated personal computer users, who she said account for less than a third of all users. "I don't think you're going to see big growth" in the keyboard utility field, she observed. Regarding Superkey's data encryption feature, she said, "Only a small group of people are interested in encrypting their work," but added that their numbers may grow as the use of local-area networks and multiuser personal computers becomes more widespread.

Alpha Software's Rabin, however, said he believes user wariness about macro processors stems from the fact that "CONTROL A [a typical command for a macro] is only slightly less cryptic" than the original, lengthy command is. What is needed, he argued, are macro processors that simplify macro generation, with such features as moving-bar pop-up menus.

Whatever the method of selection, one dedicated macro user, Conrad Kageyama, operator of an electronic bulletin board in Los Angeles, said he thinks every personal computer user should have a keyboard utility. The use of macros "can save a lot of redundant keystrokes," he advised. "If you've never used a macro processor, I think you're missing out."

"In my opinion, a system has become far too powerful when it demands human sacrifice."

COMPUTER ENTREPRENEURS AGREE

"I've been in the computer business 20 years. There's nothing that comes close to AMI's Agent Program."
[illegible]
Entrepreneur
Union, NJ

"I didn't have the [illegible] needed to pay franchise fees and startup cost for a computer store, so I thought my options in the microcomputer field were limited. That is until I found out about AMI's Certified Agent Program (CAP). Now I sell systems from the nation's largest supplier of software for professionals and the IBM PC-XT. AMI gave me a week of professional product and marketing training. I sold two complete systems within my first 10 days. In my 20 years in the business, this is the fastest success I've ever experienced."

AMI's Certified Agent Program is a unique opportunity for you to profit from the microcomputer revolution with only a small investment in the tools to get your business going. There's no franchise fee, inventory or accounts receivable to worry about. And you're fully trained at AMI's expense at their world headquarters. You're backed by extensive national advertising and AMI assumes all customer training and support functions. For more information on how we can put you into business for yourself, call or write today for your Opportunity for Professionals™ Pack.

Strategy...

Technology

At GENIX, strategy and position have made us a successful Information Services Company.

The GENIX strategy is to provide customers with superior technology, quality system solutions, and the service that comes from a company whose corporate commitment is to ensure total customer satisfaction.

Quality

Our position stems from both experience and strength. Experience born of 15 years of working in virtually every discipline of information systems. Strength comes from our relationship with our parent, National Intergroup, a $2.3 billion diversified company.

GENIX remote computing is the most cost-effective solution for large users of advanced information services. At the terminal level our 2000 plus users enjoy 99% plus average availability and a transaction response time not usually delivered by the typical remote computing vendor.

Service

In addition, GENIX consultants are available to support the needs of the most demanding customer. In telecommunications networking, data base design, process control applications, capacity planning, hardware and software evaluation, data center design; GENIX consultants are expert in their fields.

The next move is yours. It's a strategy that can lead to success. Call 1-800-US GENIX.

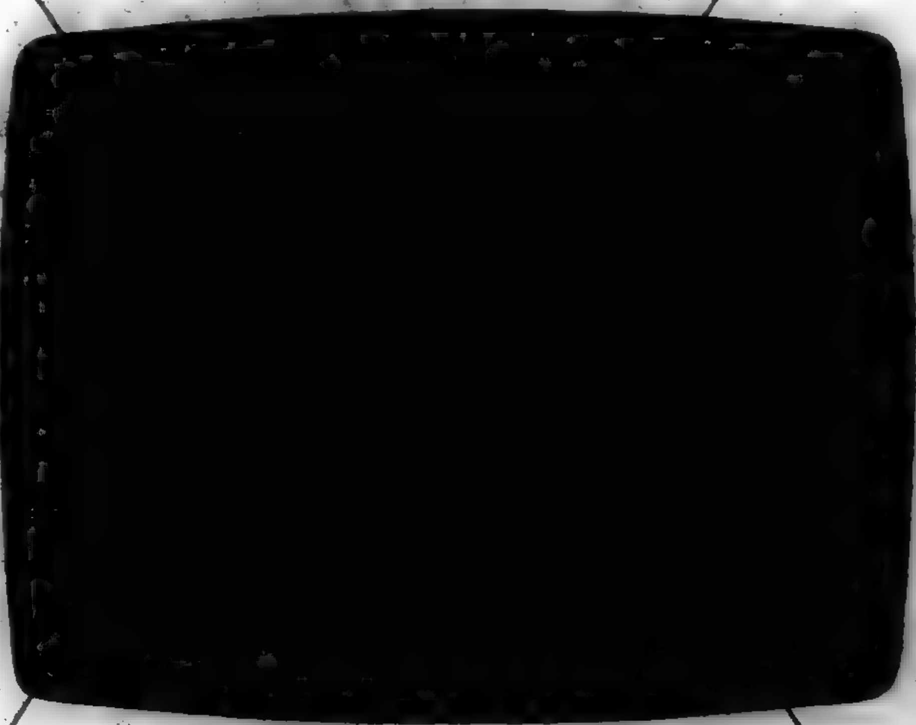
GENIX

The Lee Data Open Window™ Display gives you single-terminal access to all applications needed to handle fund transfers automatically. *Shown: A live, remote Async host session with the Clearing House Information System.*

Associated or affiliated accounts can be displayed simultaneously for faster, easier assembly of funds, then dynamically updated. *Shown: A live 3270 host session displaying a cash management system menu.*



Remember, each window represents a live 3270 or Async host session, and you can jump from session to session with a single keystroke. *Shown: A live 3270 host session displaying a payment system menu.*

Naturally, fund transfers are only one example of how our Open Window Display can save you time and effort. Call us for more good ideas. *Shown: A live 3270 host session displaying a customer data base.*

FOUR REASONS WHY THE BANKING INDUSTRY'S SMARTEST WINDOWS COME FROM OUR DUMB TERMINALS.

One Lee Data Open Window™ Display replaces four ordinary terminals.

Now, on a single terminal you can open windows to four concurrent 3270 or Async host sessions.

And transfer information from window to window, host to host, and 3270 to Async in any combination.

And zoom windows to full screen in any of four standard IBM screen sizes, including 132 columns.

All without the high cost of PC's. Or the low security.

Find out more about how banks, brokerage firms, credit card companies, and other financial institutions are using our Open Window Display. Call for FREE case histories.

Our dumb terminals are making a lot of people look smart.

Call 1-800-LEE-DATA or (612) 828-0300 for Open Window case histories, plus our FREE booklet, *MORE LEEWAY: Passport for MIS Planners.* Or write to Lee Data Marketing Services, 7075 Flying Cloud Drive, Eden Prairie, Minnesota 55344.

THE ALTOS 3068
SIX BREAKTHROUGHS IN ONE
FOR OEM [illegible]

FILE PROCESSOR SUBSYSTEM
Controls 4 DMA channels for disk, tape, floppy and parallel printer port; overlapped seeks on [illegible]

CPU BOARD
[illegible]-bit MC68020 microprocessor running at [illegible] MIPS with no wait states; [illegible]K high speed cache memory; up [illegible] MB virtual address space per program; optional floating point processor

RAM BOARD
Can be configured to OEM's needs [illegible] 16MB using 1MB, 2MB [illegible] 4MB boards

BREAKTHROUGH PRICE/PERFORMANCE

Combining the 32-bit MC68020, multiple auxiliary processors, and a tuned version of UNIX™ System V, the 30-user 3068 "is capable of a performance that rivals large mini-computers." (Computerworld, April 1985). And it does it for a micro computer price—from $7,000 for OEM quantities.

BREAKTHROUGH MODULARITY

"Using plug-in boards the way a personal computer does really sets Altos apart." (research firm Creative Strategies, Computerworld, April 1985). OEM's can choose from a wide range of modules: 10 to 40 serial ports; 1 to 16 MB of memory; 17 to 290 MB (formatted) hard disk storage.

BREAKTHROUGH HARDWARE DESIGN

"Altos is way ahead of everybody else." (Creative Strategies, Computerworld, April 1985): high speed 8 KB cache maximizes CPU speed, with no wait states; cache is simultaneously shared between many processors; high performance memory management supports demand paged virtual memory; on-board microprocessors handle all I/O processing.

XPANSION
BOARD SLOTS

ERROR from page 75

rules are, unless somebody tells you."

As John Kennick of *Computer Update* said, "The probability of a programming error in a spreadsheet program is perhaps hundreds of times as great as it would be if the same algorithm were written using a more structured programming language."

In short, spreadsheet users are assembly-language-like programmers, whether they know it or not, and they are flying blind. Spreadsheets cannot instill confidence that analyses accurately reflect management's understanding of its own business. Among solutions proposed in the press are the following:

- Be more careful. Take notes and thoroughly document everything.
- Have central spreadsheet auditing staff members review all spreadsheet work.
- Use one of the aftermarket programs that prints spreadsheet formulas in their correct cell-by-cell orientation.
- Attend training seminars.

Proposed solutions do not work

None of these work, because they go against the grain of human nature. Nobody really wants to spend large amounts of time tracing logic that is buried in piles of hieroglyphic formulas; nobody wants to stifle the very spontaneity of the micro by submitting everything to an audit committee; and nobody wants to take a class just to learn how to trick a software program into doing the obvious.

The rest of spreadsheet limitations is that the software is the simple mechanization of row and column arithmetic that has been the practical calculating convention for several millenia. What may be an appropriate tool for formatting reports is now used as a general-purpose modeler. No amount of modification can satisfactorily make up for its limitations.

Finally, the spreadsheet way of doing things is just plain tedious.

Instead of other software Band-Aids on top of spreadsheets or additional layers of clumsy bureaucratic checks, what is needed is a new software paradigm, and some new technical directions are beginning to appear.

Artificial intelligence research clearly offers great potential in many applications. Practical results to date have appeared in medical diagnosis and prognosis, in diagnosis of mechanical systems and in the form of natural language.

The initial excitement over natural language interfaces has cooled, however. It seems that relating to a computer in long phrases is quite cumbersome in many applications.

Big business management has developed a healthy skepticism of quantitative analysis. The last thing business management wants is to jump from the frying pan into the fire — from inexperienced human analysts to much more naive, and much less tractable, artificial intelligence software.

But there is a new form of knowledge representation which offers great potential to business management: natural intelligence. Natural intelligence systems allow users to express their analytic thoughts as freely and clearly as a computer will allow at the present time, and then revise them or explain them to others.

What makes software so exciting is that its history has only begun and that the technology is cumulative in its knowledge. The basic inventions are yet to come.

BETA from page 75

Another feature that Stein said he liked in Keyworks was that it "prompts you as you go, [so that] you're never lost." His copy of Prokey, he continued, sometimes leaves him confused; when a key is defined as a pause, for example, all that is displayed is the cursor.

Stein found two "cosmetic bugs" in the version of Keyworks that he used and said both were later corrected. His firm, which trains executives in personal computer use, plans to recommend that its clients buy Keyworks and familiarize themselves with macro processing, he noted.

Conrad Kageyama, the beta tester of Borland's Superkey, is also a veteran Prokey user. A Los Angeles gas station operator by day and electronic bulletin board systems operator in his off-hours, Kageyama said he likes Superkey for its ability to clear a current macro and load a different macro without having to exit from an application. Such a feature, he pointed out, is not available in the earlier version of Prokey that he uses. The feature is available in the latest release of Prokey, Version 4.0, a Rosesoft spokeswoman said.

Kageyama is no stranger to macros; he uses a 7,000-char. macro, written using Prokey, to load his station's daily sales figures into 1-2-3 automatically. Since Superkey reads Prokey macros, Kageyama was able to avoid rewriting that massive macro and still gain Superkey features.

Kageyama said he has little use for Superkey's data encryption features, which reportedly allow users to encode data to either a Borland-created scheme or the Data Encryption Standard of the U.S. government.

Data switching: Equinox makes it simple.
Introducing the Equinox Data PBX; a port selector that makes switching terminals between computers as simple as dialing a phone number.
Installation is simple; do-it-yourself using regular telephone PBX-type cabling and connectors.
And it's simple to integrate into your system, thanks to our super friendly, self-explanatory configuration menus.
The system grows to meet your needs, from 24 to 1320 lines. And the state-of-the-art design combines performance and reliability in a compact package that won't break your budget.
Check out the most full-featured Data PBX on the market today; call 1-800-DATA-PBX, for an on-site demonstration.

COMMUNICATIONS

WIRE TAP/DANIEL MINOLI

Higher initial costs pay off

Divestiture has altered the way communications managers and network planners must function. Installation intervals have become longer and installation costs are rising, thereby curtailing network elasticity and the ability to effect quickly redesigns, optimization and patches. Mean time between failures and mean time to repair figures have generally suffered due to the intrinsic plurality of service providers on a given end-to-end link.

There are two ways to approach the altered fabric of network management in this new environment, and both can be valid depending on an organization's point of reference, definition of efficiency or optimality criteria.

The first approach follows the status quo philosophy in network design. The cost function is taken to be the sum of the cost of all network components, without explicit consideration given to secondary costs associated with downtime and repair intervals. When a network link fails, the operations manager faces the vicissitudes of restoration and the ensuing service interruptions. No explicit redundancy is built into the network at implementation time.

The advantage of this approach is an apparent reduction in costs, both when the network is implemented and in recurring expenses. This may be acceptable in an insurance company's bill processing or batch environment. In reality, this approach is the de facto paradigm for a large percentage of commercial networks.

The problem with such an approach is that literally millions of dollars in real or potential revenue can be lost

See ALTER page 102

Minoli is an associate vice-president, systems planning and engineering, of Prudential-Bache Securities, Inc. in New York.

Survey finds firms plan telecom budget increases

By Paul Korzeniowski
CW Staff

NEW YORK — There's a "whole lotta shakin' goin' on" in the communications field, according to a report by the Conference Board, Inc., a market research outfit headquartered here.

The report, "Current Issues in Corporate Telecommunications," found that 92% of the corporations surveyed plan a major telecommunications change in the next three years. The 348 survey respondents have more than $10 million in annual sales.

The telecommunications changes included budget increases. Three quarters of the respondents expected costs to increase during 1985 and 1986; one quarter of the firms projected 9% to 12% increases.

The survey determined how the budgets are divided. Costs were split into internal communications, which included private branch exchange costs; long-distance voice transmission; long-distance data transmission; local voice transmission; local data transmission; and overhead. Internal communications and long-distance voice transmission were the most costly items. Half of the firms reported that internal communications takes up 20% to 40% of their budgets. Long-distance charges account for 30% to 35% of most budgets.

Respondents were asked to name their most costly long-distance service. Close to 60% named AT&T's Wats. The second and third most cited services were AT&T's message units and AT&T's private lines, 15% and 10% respectively.

To implement communications changes, approximately two-thirds of the communications managers plan to revamp their staffs and organizations in the next two years. The most likely change will be pulling communications functions into one group or shifting communications respon-

See POLL page 104

Software boosts service options

DATA STREAM
John Dix
CW Senior Editor

AT&T has developed software for switches used by local telephone companies that will enable these companies to offer a host of new calling services for residential and business users.

The capabilities provided with the so-called Local-Area Signaling Services (Lass) were outlined by C. Brant Hirschman, Grant E. Swinehart and Marie L. Todd, all of AT&T Bell Laboratories, in an article in the May issue of the "Record," a Bell Labs publication.

Two telephone companies are reportedly testing Lass, which is said to be based on the Common Channel Interoffice Signaling (CCIS) technique used in AT&T's long-distance network. Local CCIS provides transmission of signaling information in the local network independently of the voice network. The four AT&T software components that make this possible run on 1A Electronic Switching Systems, which AT&T manufactured.

The new features include the following:

- Automatic reconnect. This feature enables callers to redial the last number they called, or the last person that called them, by dialing *66 on a push-button phone or 1166 on a rotary phone. The central office switch scans a temporary memory associated with that line and places the call, all within less than a second.

See SERVICES page 104

- Fujitsu America has announced an 810M bit/sec., single-mode fiber-optic system that can carry 12,096 signals/96
- California Network Systems has announced PCnetwork/SNA 3270 Gateway, which allows microcomputers on IBM's PC Network to emulate IBM 3270 series devices/96
- Fibercom has announced a fiber-optic multiplexer for IBM 3270 environments that can be multidropped/97
- MCI Communications has revised its residential and business rates effective July 1/97

How to make your computer room bigger by shrinking your modems.

Trade in your huge, old, ugly and under-featured 9.6 kbps modems on sleek new AJ [illegible] modems for only $[illegible].

We'll also give you a $[illegible] trade-in* for your old working model.

At just over 2" high x 6" wide, you can fit up to 64 in a standard six foot rack and save valuable computer room space.

Use the same modem for standalone or rack mounting.

The AJ [illegible] is a full duplex, synchronous modem that operates at 9.6 kbps over a four-wire dedicated circuit in point-to-point communications. It's V.29 compatible.

The AJ [illegible]'s two-call autodial backup system can regain your connection over dialup lines should lease lines fail.

(Actual size.)

You also get a full array of front-panel controls softstrapped for easy set-up. With down-line loading and security that redirects control to a central site. Full diagnostics and self-testing assure reliability.

Act now. Offer ends July 31, 1985.

*Trade-ins must be V.29, 4-wire, FCC leased-line modems from end users.

UDS broadens product offerings with five modems

HUNTSVILLE, Ala. — Universal Data Systems, Inc. (UDS) has added five modems to its product line. They include the following:

- UDS 202S/D is an asynchronous or synchronous half-duplex modem that uses frequency shift keyed modulation and transmits data at speeds up to 1,200 bit/sec.

The product has manual answering and automatic answering, supports pulse or tone dialing and can store one 30-digit number and redial a number up to 10 times. The modem includes automatic loopback dialing circuitry that can be used to test for a problem.

- UDS 201B is an asynchronous/synchronous 2,400 bit/sec. half-duplex modem that operates over the switched network or a full-duplex modem with four-wire leased lines.
- UDS 201C is a half-duplex synchronous modem that transmits at speeds up to 2,400 bit/sec.
- UDS 212A and UDS 212A/D are full-duplex, asynchronous or synchronous modems that transmit data at speeds of 300 to 1,200 bit/sec. The products' built-in test features include digital loopback, analog loopback, remote digital loopback as well as self-testing.

Both modems feature automatic answering, and UDS 212A/D includes an automatic dialing feature that stores up to 10 126-char. logon sequences, UDS said.

UDS 202S/D costs $495; UDS 201B and UDS 201C each sell for $695; UDS 212A costs $495; and UDS 212A/D is priced at $545, according to the vendor.

More information on the modems is available from UDS, located at 5000 Bradford Drive, Huntsville, Ala. 35805.

Controller links IBM, Burroughs

SALT LAKE CITY — Beehive International, Inc. has enhanced its ATL-083 Burroughs Corp. TD830/MT983 emulator to enable simultaneous Burroughs and IBM 3270 communications.

When the ATL-083 auxiliary port is connected to Beehive's CC74 or 3270MS cluster controller, a keyboard command turns the ATL-083 into an IBM 3178/3278 emulator, the company said. IBM screen format and status line/icons are said to be provided, along with full IBM 3178 keyboard function. Concurrent sessions with IBM and Burroughs hardware can be maintained.

The device is said to support Burroughs' major polling protocols such as poll/select; fast select, group poll and multipoint contention.

The emulator costs $1,295 in single quantities and is available immediately.

Beehive can be reached through P.O. Box 30668, Salt Lake City, Utah 84130.

Encryption tools debut

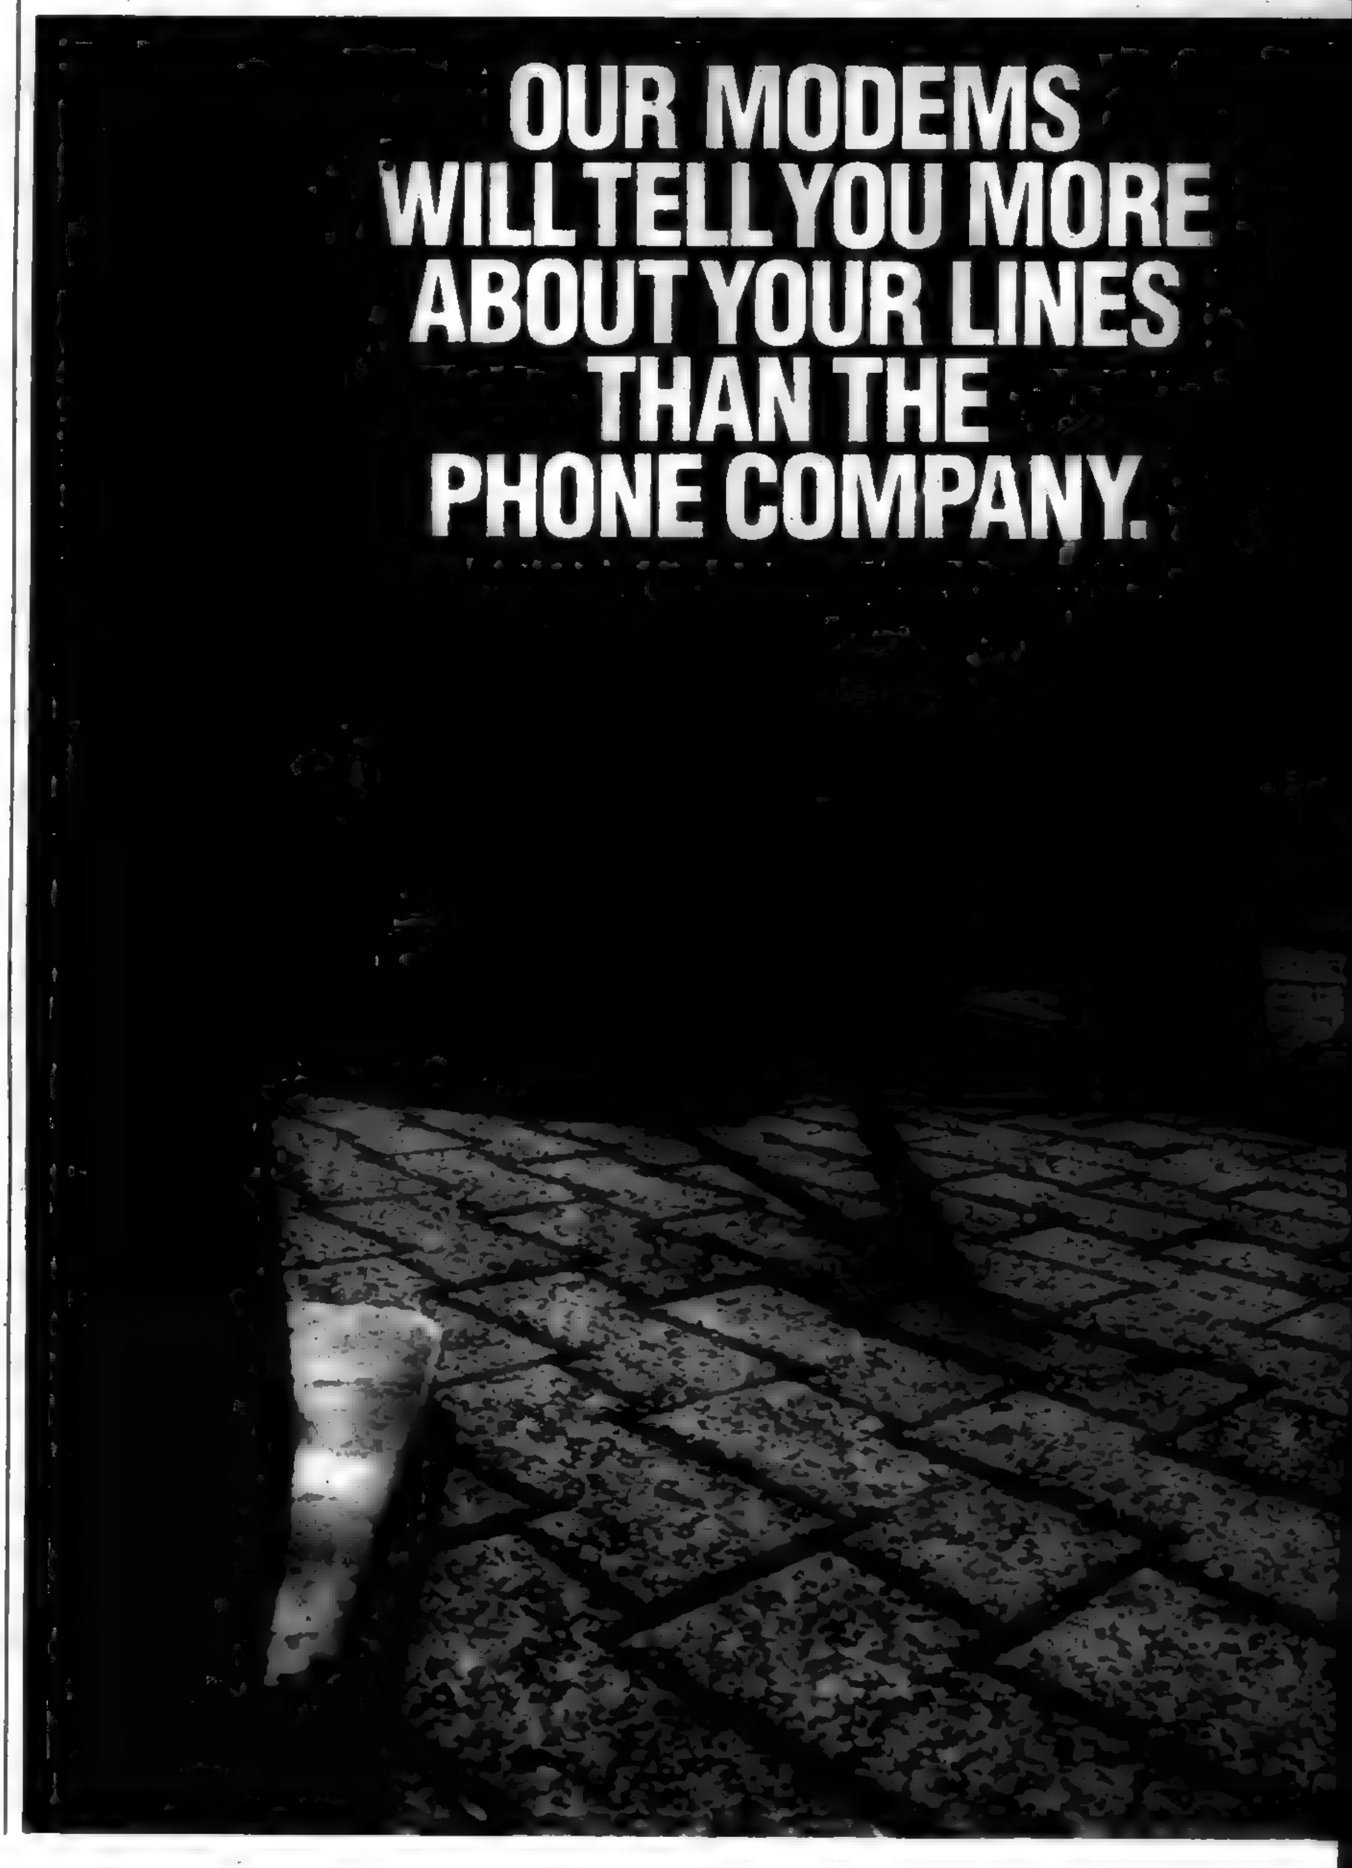
SUFFERN, N.Y. — Datasentry Technologies, Inc. has announced four data encryption devices.

Two of the encryption devices support both the National Bureau of Standards' Data Encryption Standard and DPS, a proprietary algorithm. The other two devices support one of the two algorithms.

The devices support full-duplex, asynchronous transmissions at speeds of 300, 1,200 and 9.6K bit/sec. The products are reportedly attached through an RS-232 interface.

Prices for various models range from $595 to $995.

Datasentry Technologies is located at 1 Executive Blvd., Suffern, N.Y. 10901.



OUR MODEMS WILL TELL YOU MORE ABOUT YOUR LINES THAN THE PHONE COMPANY.

Fujitsu touts capacity of fiber-optic system

LAS VEGAS — Fujitsu America, Inc. announced here recently the development of a single-mode, fiber-optic system that is reportedly capable of carrying twice as much information on a single pair of fibers as any lightwave system in use in the U.S. today.

The Optical Fiber Transmission System operates at 810M bit/sec. and can support 12,096 voice, data or video signals, the company reported. It uses proprietary semiconductors that are said to include laser diodes, photo detectors and large-scale integrated circuits.

Prior to the introduction of this system, Fujitsu's 405M bit/sec. fiber system represented one of the largest capacity systems in operation in the U.S., the company claimed. That system could support 6,048 channels.

After completing a final test phase in Japan, the 810M bit/sec. Optical Fiber Transmission System will undergo a U.S. field trial in a telephone network environment and will be added to Fujitsu America's product line in the fourth quarter, the vendor reported.

The estimated cost per circuit mile of the fiber system represents an 85% savings over traditional copper wire technology, the company said.

Fujitsu America is located at 3055 Orchard Drive, San Jose, Calif. 95134.

Gateway out for micros on IBM net

MILPITAS, Calif. — California Network Systems has announced PCnetwork/SNA 3270 Gateway that allows microcomputers on IBM's PC Network to emulate IBM 3270 series devices.

Depending on the configuration, either a personal computer on the network or a Netserver Communications System from California Network Systems functions as the gateway.

In either implementation, the gateway mimics an IBM 3274 Model 51C or Model 61C controller supporting 3278 and 3279 displays and 3287 printers.

The gateway is supported with IBM's Synchronous Data Link Control (SDLC) protocol under Systems Network Architecture (SNA).

The product will reportedly be compatible with all IBM-compatible networks that implement IBM Netbios, including Microsoft Corp.'s MS-Networks and Intel Corp.'s Open Net.

The PCnetwork/SNA 3270 Gateway family of products is said to provide users with three configuration options that vary by price and performance.

The entry-level product is software that runs on an IBM Personal Computer, Personal Computer XT, AT or compatible that has an IBM SDLC card. It enables up to 12 concurrent SNA 3270 sessions to be supported.

By replacing the SDLC card with a Comcard Communications Card the number of concurrent SNA sessions supported by the gateway can be increased to 24. When a Comcard and associated software is used in a dedicated Netserver Communications System up to 48 SNA 3270 sessions can be supported.

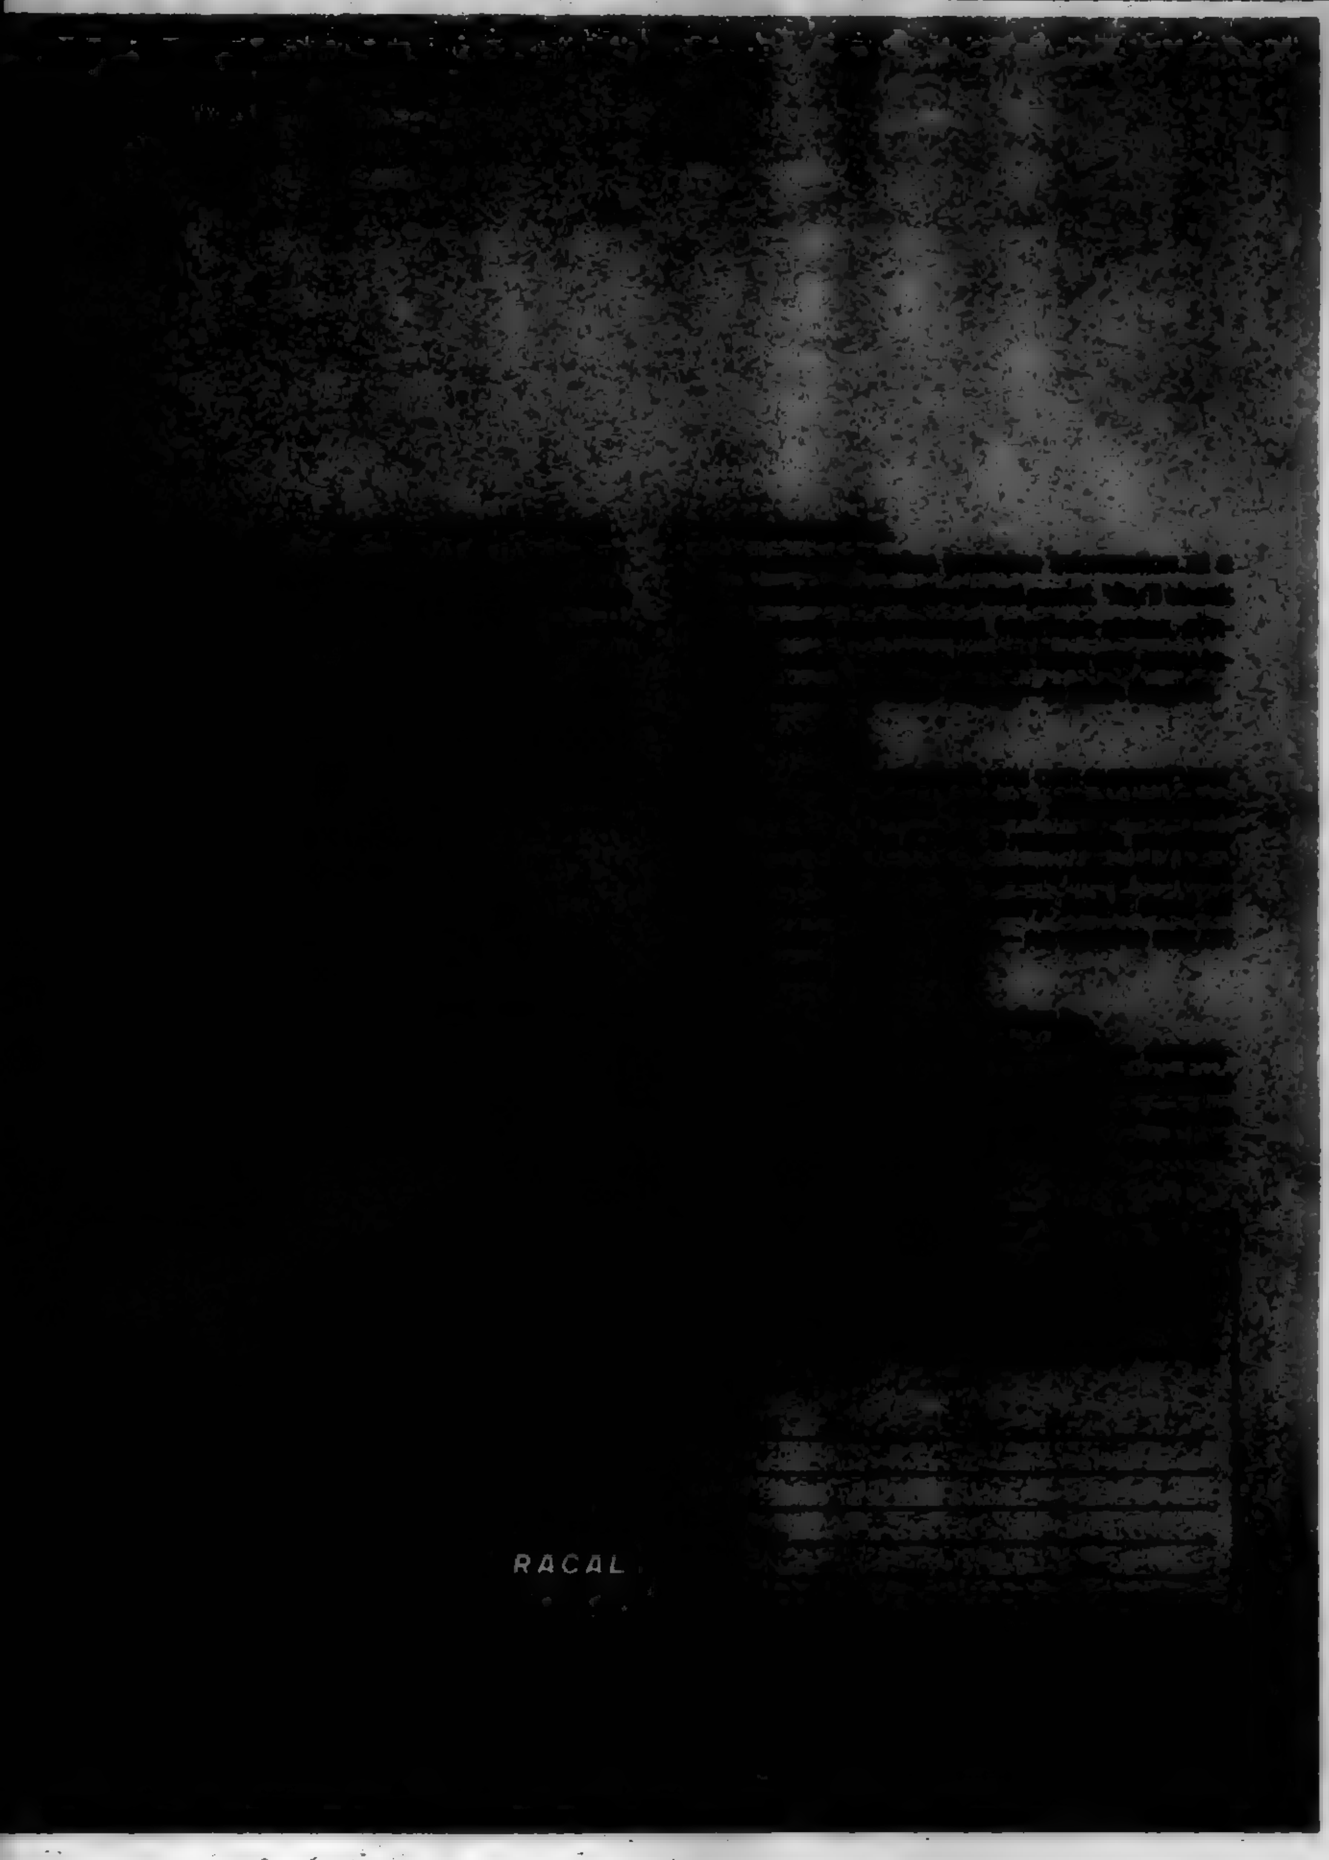
The Netserver can support a total of four Comcards, providing for up to 192 sessions on four SNA networks, the vendor reported.

A feature of the product called Hotkey is said to enable users to toggle between 3270 display screens and DOS applications that are maintained concurrently. Hotkey can also be used to switch between the gateway status screen and other DOS applications.

To serve as a gateway, Personal Computers must have 384K bytes of random-access memory (RAM) and 8K bytes of RAM for each active mainframe session.

Gateway prices average $500 per microcomputer.

California Network Systems is located at 372 Turquoise St., Milpitas, Calif. 95035.



THE MONITOR FOR CICS

ONE STOP CICS MANAGEMENT!

CICS
PERFORMANCE
CONTROL...from
LANDMARK
SYSTEMS
CORP.

Online Graphic Monitor

For any level of operations or management to identify performance problems immediately—without intervention!

- Powerful color histograms
- Sight and sound alerts
- Cycles on user intervals
- System, application and user targets

Activity Monitor

Crises intervention tool that allows recovery, prevents outages, frees "hung" terminals, and isolates problems

- Realtime problem analysis
- Cancels problem tasks
- Shows transaction problems—loops, ENQUEUE lockouts and VSAM string waits

Batch Reporting

Summary, reporting and compression of multiple systems allowing long range data retention for utilization analysis and planning.

- Flexible report writer
- Cost/accounting support
- Graphic/tabular reporting
- Historical archiving with summarization

Online Browse

Online access to transaction data, "after-the-fact" problem determination and replay of performance for the day.

- Browse data selectively
- Review past performance.
- Easy-to-read formats
- Access each transaction record online

Data Collection

Captures transaction level information without extensive file handling. Provides basis for online and batch reports.

- Disk data compression
- Very low overhead
- Automatic re-positioning
- PAII, CMF NOT required
- PAII conversion provided

Storage Monitor

Provides information for and analyzes effects of tuning CICS and operating system. Aids in pinpointing problems.

- Analyze CICS storage online
- Display, alter storage
- Show program compression
- Track temporary storage
- Show subpool use

File Monitor

Pinpoints problem files/volumes and shows effects of tuning. Aids VSAM file definition. Analyzes I/O contention.

- Each CICS I/O measured
- CICS counts captured
- Provides VSAM split data
- Creates better balance and performance

Application Interface

Identifies and tracks specific applications and events. Supports UFO™, MANTIS™, GENR/OL™, NATURAL™, and DMS™. User interfaces, clocks and counters.

Resource Controls

Prevents system outages by automatically cancelling applications that exceed CPU, file, I/O or storage limits.

Supertrace

Gauges effect of new applications on system, reduces testing time, allows production tracing and enhances performance.

- Quick application time
- Resource consumption data
- Application debugging tool
- Alternative to AUX TRACE in production system

MCI files rate revisions with FCC effective July 1

WASHINGTON, D.C. — MCI Telecommunications Corp. has announced that it has filed rate revisions with the Federal Communications Commission that are scheduled to go into effect July 1.

The rate changes include the following:

- Reductions of up to 11% for residential and business services.
- Elimination of the $10 Advantage Service Customer fee to customers with monthly bills of $200 or more, which automatically dials MCI access numbers and provides account billing.
- Volume discount reductions of 2% to 9% for customers with $20 to $200 monthly bills.
- An average 4% reduction for daytime MCI Wats customers with 40 to 80 hours of monthly use. In addition there is a 4% increase for nighttime Wats fees.
- A 5 cent increase in per-call surcharges of travel card rates. First-minute travel card rates have been increased, and most additional-minute rates have been decreased.

MCI Telecommunications is located at 1133 19th St. N.W., Washington, D.C. 20036.

Fibercom multiplexer out; supports up to 32 cables

ROANOKE, Va. — Fibercom, Inc. has announced a multiplexer that supports up to 32 coaxial cable outputs from an IBM 3274 communications controller over a single pair of fibers.

The rack-mounted FMX-32 is modular and can include from one to four eight-channel cards, according to Fibercom. Distances between controller and remote end points can range up to 15,000 feet, three times the reach of coaxial cable, the company reported.

Company President Albert Bender claimed the FMX-32 is the only fiber-optic multiplexer that supports multidrop configurations.

Using a passive star coupler at the remote site, the multiplexed signal coming over the pair of fibers can be split and routed to up to 10 locations, Bender said.

Full IBM Type A peripheral speeds are said to be maintained.

Available now, the FMX-32 costs $1,930 for an eight-channel unit and $3,860 for a 32-channel configuration.

For more information, Fibercom can be reached through P.O. Box 11966, Roanoke, Va. 24022.

PROTOCOL CONVERTERS

- Datagraf, Inc. has announced a bisynchronous protocol converter said to be available for IBM Systems Network Architecture (SNA), Burroughs Corp. or Ascii hosts.

The Series II 3270 Bisynch Host Protocol Converter reportedly supports the bisynchronous output of IBM 3271, 3274, 3275 or 3276 controllers for conversion to or from a protocol of the user's choice.

The 3270 Bisynch Host/SNA is said to enable bisynchronous controllers to emulate an IBM 3274 SNA/Synchronous Data Link Control controller. It reportedly supports eight devices, expandable to 32.

The 3270 Bisynch Host/Burroughs reportedly makes a bisynchronous controller look like a Burroughs TD 830 or MT-983 poll-select terminal. It is also reportedly expandable to 32 devices from its standard eight.

The Bisynch Host/Ascii converter is designed to be implemented over local-area or packet networks, the vendor said. It reportedly supports up to seven Ascii lines for porting to a network bus interface unit.

The 3270 Bisynch Host/SNA costs $5,995; the 3270 Bisynch Host/Burroughs is $6,200; and the Bisynch Host/Ascii converter costs $6,395.

Datagraf, No. 100, 6626 Silvermine Drive, Austin, Texas 78736.

- Method Systems has announced PCT-100, a communications device that enables Digital Equipment Corp. VT100 or VT200 terminals to emulate Data General Corp. Dasher D200 terminals.

The product mimics Dasher function key and screen attribute features so users can run any DG system utility, the vendor reported. A user can set communications parameters for various bit/sec. rates, parity checks and handshaking techniques.

PCT-100 for a VT100 costs $595, and for a VT200, it costs $605.

Method Systems, Suite 202, 3511 Lost Nation Road, Willoughby, Ohio 44094.

SOFTWARE

- Fischer-Innis Systems Corp. announced Release 2.4 of Emc2, an electronic mail service for IBM

Continued on page 98

Before VM Magic, embarking on a migration from one disk type to another was a formidable undertaking.

At last, an effortless path for DASD migration.

Now you can migrate to the new, faster disk device types in only the time it takes to copy your files—a matter of hours, instead of months or years consumed by program and job control conversions.

VM MAGIC bridges the distance between incompatible disk device types and guest operating systems running under IBM's Virtual Machine Facility (VM) without conversions or program modifications.

That's right. VM MAGIC enables your system to store and retrieve data from any type of disk device, regardless of operating system, access method or software.

Get greater economy and performance without waiting.

With VM MAGIC you save more than the manpower expense of a long, labor-intensive conversion effort. You also reduce hardware and energy expenses, because with VM MAGIC you can respond to any of the disk device requirements of guest operating systems using any DASD. Save thousands of dollars in disk rental, maintenance and operating costs by eliminating outmoded or unnecessary disk device types.

Expand your options under VM.

VM MAGIC also lets you:
- increase system performance by migrating to, and taking advantage of, new technology disk hardware.
- select disaster recovery and backup sites without regard for disk configuration.
- prolong the life of your current software by eliminating its dependence on a specific disk environment.
- make decisions about hardware upgrades, program modifications and conversion efforts in a logical, orderly way.

For more information on the time and money-saving applications of VM MAGIC in your installation, call SDI at (415) 572-1200.

SDI.

SDI, 1700 SOUTH EL CAMINO REAL, SAN MATEO, CALIFORNIA 94402, TELEPHONE (415) 572-1200

mainframe MVS and DOS environments running TSO, CICS or ACF.

A spokesman said the product includes capabilities for forming electronic mail networks between mainframe sites. Emc2 also includes a programmer interface that provides application subroutines and user exits that communicate with Emc2.

Release 2.4 now provides integrated support for the IBM Personal Computer and compatible machines. Personal computer users can reportedly access all Emc2 mail and calendar features from their micros and download mail and documents from the Emc2 data base, the vendor said.

Emc2 Release 2.4 is priced from $14,000 for the DOS version to $18,000 for the OS version.

Fischer-Innis Systems, 4715 Merchantile Ave., Naples, Fla. 33942.

MULTIPLEXERS/ MODEMS

■ **Astrocom Corp. has added Extended Access System (Easy) to its Squeezplexer product line of coaxial and fiber-optic multiplexers for IBM and compatible controllers.**

Easy is said to allow a user to double the number of terminals accessing an IBM 3274 controller on a contention basis. The vendor said Easy permits up to 64 terminals to contend for the 32 3274 ports on a session basis using one RG62A/U coaxial cable.

Easy is suited for point-to-point, multidrop or star connection configurations, the vendor said.

The 64-port Easy unit costs $6,900, the vendor said.

Astrocom, 120 W. Plato Blvd., St. Paul, Minn. 55107.

■ **Able Computer, Inc. has announced a multiplexer that reportedly emulates the Digital Equipment Corp. DHU-11 multiplexer for DEC VAX and PDP-11 series computers.**

The Able DHU/HS is said to support 16 lines at 38.4K bit/sec. and features on-board flow control to reduce overload on the host.

DHU/HS is said to support high-speed graphics, workstation and terminal-intensive applications. It is reportedly supported by all VAX and PDP-11 operating systems and can be used with several interfaces, including RS-422, RS-232, current loop and Telco Research Corp. Telco Jack, the vendor said.

The DHU/HS is priced at $3,495 and will be available July 1.

Able Computer, 3080 Airway Ave., Costa Mesa, Calif. 92626.

■ **Complexx Systems, Inc. has announced a seven-port, point-to-point statistical multiplexer.**

The TX7 reportedly allows seven devices to communicate simultaneously at speeds up to 9.6K bit/sec. by using buffers and data compression techniques. The product is said to correct any errors caused by transmission line noise automatically. The TX7 reportedly features speed and code conversion, allowing devices operating at different speeds and setup parameters to communicate.

The TX7 is compatible with most common Ascii, asynchronous and RS-232 computers and peripherals, according to the vendor. Its composite link can reportedly use any full-duplex synchronous modem at speeds up to 9.6K bit/sec.

The TX7 is priced at $1,495.

Complexx Systems, 4930 Research Drive, Huntsville, Ala. 35805.

■ **Amdahl Corp. has enhanced its line of 2211 time-division multiplexers with a high-speed synchronous loop access module (HS Slam) and support for higher speed transmissions.**

HS Slam is an integrated limited-distance data set installed with an Amdahl 2211 multiplexer. The product can be used to connect remote devices at up to 32 miles away over four-wire cable. It supports transmission speeds of 56K and 64K bit/sec.

The 2211 multiplexer can also now support channel and trunk rates at speeds up to 768K bit/sec. The higher speed enables users to send video as well as voice and data images, the vendor reported.

HS Slam costs $900, and a matching remote data set sells for $700. The channel option, which consists of a channel connecter assembly, asynchronous I/O card and interface card, is priced at $1,660. A fiber-optic trunk costs $2,000.

Amdahl, Communications Systems Division, 2500 Walnut Ave., Marina Del Ray, Calif. 90291.

LOCAL-AREA NETWORKS

■ **Network Systems Corp. has introduced its AC715 Link Adapter, which provides a gateway from its Hyperchannel network to T1 lines.**

Hyperchannel connects a variety of mainframes, mincomputers and various devices on a high-speed network, the vendor said. The AC715 Link Adapter adds full-duplex operation, data buffering and a continuous protocol to the Hyperchannel for T1 link gateway capabilities.

A vendor spokesman said that the product will sustain 80% line utilization for full-duplex file transfers at speeds up to 2M bit/sec.

AC715 Link Adapter costs $40,000.

Network Systems, 7600 Boone Ave. N., Minneapolis, Minn. 55428.

■ **Process Software Corp. has announced a version of its FTP file transfer software to run under Digital Equipment Corp.'s RSX-11 operating system.**

FTP conforms to TCP/IP, a U.S. Department of Defense standard protocol for Levels 3 and 4 of the International Standards Organization's

The cost of transmitting data just keeps getting lower and lower. Thanks to Datagram. And our line of inexpensive, yet immensely talented modems.

All are totally soft and down-line loadable, have built-in signal quality monitoring, and run on unconditioned voice grade lines. Yes, that's right. Even our 14400 with built-in channel buffered mux which sells for under $4,500. And you can get it with trellis encoding for just a little more.

Our 9600 point to point modem is a real work horse at only $1,495. But if you want a 9600 with a four channel buffered mux, we've got that too at only $1,895.

If your application requires multi point modems, our 9600 fast poll train in 7½ ms. That's the fastest in the world. And goes for $2,195.

On top of that, all our modems are preconfigured at the factory, so all you have to do to get them going is connect them to the line.

We have modems or other data communications equipment in your hands in just 72 hours. The phone call is free. So call now, 1-800-235-5030 and order your Datagram modems today.

THE TOTALLY COMPATIBLE TERMINAL.

The 5540 terminal from Teletype Corporation is ideal for 3270 protocols, agrees with your pocketbook and gets along so well with people that you'll wonder how you got along without it.

As our third generation of 3270-compatible terminals, the 5540 represents an even better value than its predecessors. Besides being competitively priced, the 5540 supports 3270 SNA/SDLC in addition to 3270 BSC line protocols.

The 5540 also has a more powerful microprocessor-based controller that will cluster up to 32 devices, including our letter quality printer. We also offer a tabletop controller that will cluster up to 12 devices.

Available with standard and reduced size displays, 4-color capability and 80 or 132 column formats, the 5540 can be tailored to your specific needs. And, each display has a smudge-resistant, non-glare, high resolution tilt screen.

To further enhance operator productivity, the terminal features a detachable keyboard with 3270-like layouts, 24 program function keys, and a status line that includes a response time monitor.

Backed by our experience in building over 300,000 3270-compatible terminals, the 5540 is building a strong record for reliability. If problems occur, self-diagnostics pinpoint them.

You'll find our 5540 terminal is very easy to like.

If you'd like to get to know it a little better, write:
Teletype Corporation, 5555 Touhy Ave., Dept. 3223-F,
Skokie, IL 60077. Or call 1 800 323-1229, ext. 501.

TOWER XP. THERE ARE OTHERS IN THE CLASS, BUT THEY'RE JUST HERE TO LEARN.

The most popular school of thought in the computer industry today holds that a computer system's value is directly proportional to the number of bells and whistles tacked onto it.

NCR took a different, more pragmatic approach in designing the Tower* XP.

Of course we designed in highly advanced NCR features. A powerful Motorola 68010 CPU. Consistent error-logging. Extensive in-service and remote diagnostics. Automatic Power Failure Recovery. An NCR-enhanced UNIX* that virtually never PANICs. Local area networking (LAN). The most complete communications package of any comparable system, including X.25 and SNA/SDLC. And much more.

But thirty years in the computer industry has taught us that there are even more enduring qualities vital to OEMs.

Innovation. Reliability. Service.

NCR spends thousands of hours and over a quarter of a billion dollars on R&D every year to assure that NCR products are of unmatched innovation and reliability. And over 400 field service offices nationwide guarantee you fast service if there is ever any problem.

NCR's commitment to systems builders. It puts Tower XP in a class by itself.

TOWER XP.
BUILT FOR SYSTEMS BUILDERS BY NIT-PICKING FANATICS.

network architecture model. File transfers can be initiated by a user or automatically from a command file, the vendor reported.

The package operates with DEC Deuna or Dequa Ethernet network controllers. The product runs under DEC RSX-11M, RSX-11M-Plus, Micro/RSX and IAS operating systems. FTP also runs on controllers from Proteon, Inc., which makes Pronet.

FTP costs range from $2,000 to $6,000 for each CPU on a network.

Process Software, P.O. Box 746, Amherst, Mass. 01004.

NETWORK SERVICES

■ MCI International (MCII) has announced that it will provide access to International Business Service (IBS) beginning in the third quarter of this year.

IBS allows customers to transmit digitized voice, data, facsimile and video signals at rates of 56K bit/sec. and higher.

MCII will initially offer service to the UK, West Germany and Ireland. Negotiations are under way to extend service to the Netherlands, France, Italy and Sweden, according to the vendor.

MCI Communications, 1133 19th St. N.W., Washington, D.C. 20036.

■ Western Union, Inc. has introduced Electronic Mail System (EMS), software that runs under IBM's OS operating system and enables mainframe systems to access Western Union's Easylink electronic mail system.

In addition to sending messages via Easylink, users can send messages to subscribers via other Western Union services, including Easylink mailbox, Telex I, Telex II, Mailgram and Express Document, Western Union said.

EMS is said to enable users to route messages to specific IBM terminals, printers or applications. The service features on-line directory, forms generator, security features and audit trail, according to the vendor.

A site license for the software costs $9,500 or $10,500 for IBM's OS operating system. Hardware costs an additional $3,700, according to the vendor.

Western Union News Bureau, One Lake St., Upper Saddle River, N.J. 07458.

ALTER

from page 98

every time there is a link or network outage, particularly in banking and financial industries.

The second approach for coping in the postdivestiture era involves a conscious philosophical shift by network planners and general management to build in resource redundancy.

The higher initial cost is accepted as a trade-off for reliability and for a more comprehensive measurement of financial efficiency. Here the real cost to the organization is the sum of the network cost and the revenue loss due to outages; the optimization criterion is that of minimizing the overall cost.

This unorthodox approach may require a redefinition of budgeting strategies. Clearly, in this scenario, the budget of the communications department must be enlarged to accommodate the cost of additional facilities, and the budget of users adjusted accordingly.

Notwithstanding the shift this approach implies, the organization as a whole should benefit in the long term from reliability in network-supported business revenue, productivity gains and user satisfaction.

> ”
>
> *The higher initial cost is accepted as a trade-off for reliability and for a more comprehensive measurement of financial efficiency.*

At the technical level, this approach may involve the following:

■ Spare local loops brought online by patching equipment and other redundancy for critical paths.

■ High-connectivity packet networks — having at least two or three links serving each city in the backbone net — with ability to route around problems.

■ Diagnostic equipment, which may actively point to problems for early resolution.

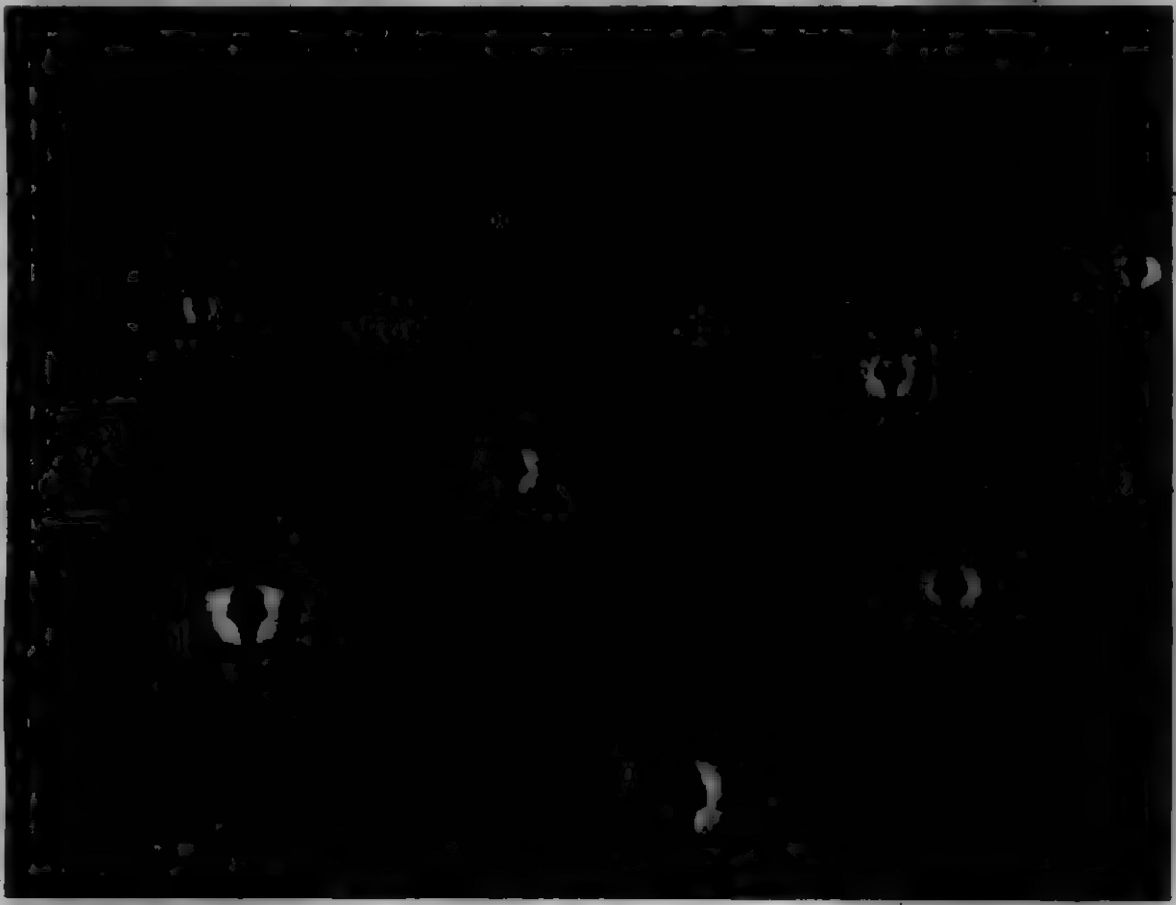
■ Existing and emerging customer-controlled rearrangement facilities such as digital access cross-connect systems.

■ Network simplicity dominating network cost.

As an example of the last point, in a previous affiliation this author was asked to design and implement a simple network connecting a South Pacific nation to New York. From a reliability point of view an international record carrier line from New York directly to the South Pacific through San Francisco would have been optimal.

Because of a modest cost differential, the intended user preferred to employ a circuit that ended up involving a local loop, 10 modems, three international lines, one domestic long-haul line in the foreign country, two multiplexers and a message switch. The propagation time, the retransmission time and the discrete components' processing time would be enough to raise serious doubts about the system's long-term integrity.

In remote computing services, the time has passed for plain vanilla.



Today's information requirements call for more computing flavors than plain vanilla timesharing. That's why Boeing Computer Services is providing alternatives to our MAINSTREAM® teleprocessing service.

For example, Boeing now provides you service at fixed cost via our Equivalent Machine option, which simulates a minicomputer environment.

And we have a number of dedicated machine options that let you combine Boeing Systems Software and Service Management expertise with your own hardware, allowing you to concentrate on business, not managing your computers. The result: cost-controlled data processing.

We're offering advanced data base management systems, too. Like Model 204, FOCUS*, and other easy-to-use, end user Fourth Generation Languages, which can support large-scale data base processing.

These and other enhanced offerings

from Boeing illustrate our continuing effort to give you all the integrated information services you need. Including distributed processing and micro/mainframe links, office information systems, additional software solutions, education and training, and a variety of professional support services. All designed to let you maintain greatest possible control over your information processing at lowest possible cost.

For more information or the location of the sales office nearest you, call toll-free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M.S. CV-26-21B, 7980 Gallows Court, Vienna, VA 22180. The flavor of computing has changed; our dedication to service hasn't.

#3 In A Series: Setting Standards in Mainframe Applications Software.

Could This Be The End Of Hand-Me-Down Software?

Think of how applications software has always been built. And enhanced.

A quick fix on a piece of general ledger software . . . another loop on the accounts payable package . . . a hasty patch to the payroll program and presto: Announce to the world a "revolutionary new generation of software designed to address today's information needs."

Not only is it not true. It doesn't work anymore. And you deserve something better. Something more than a hand-me-down, patched-up solution.

Which is what Software International, the company whose first general ledger package started the applications software business, is suggesting right now.

The time has come to put aside expedient answers. To dismiss short-lived whistles and bells. And to begin building and delivering software that makes real sense both from the data processing and end-user points of view. Software, built cleanly, intelligently, that gives you increasing value over the long term.

We detail our thoughts in a 35-page white paper entitled "Setting Standards in Mainframe Applications Software." We'll send you a copy at no cost.

The paper focuses on fifteen topic areas we believe to be critical to the long-term success of applications software installations. It looks at the coming generation of "intelligent" software architecture and what that will mean for you.

Our paper covers software installation, service and support. In short, what you should expect — even demand — from your software vendor.

Whether you are developing your own software or evaluating a package, you'll want to read this timely report.

It'll shed fresh light on some old ideas.

For a copy call 1-800-343-4133, in Massachusetts 1-800-322-0491, or clip the coupon below.

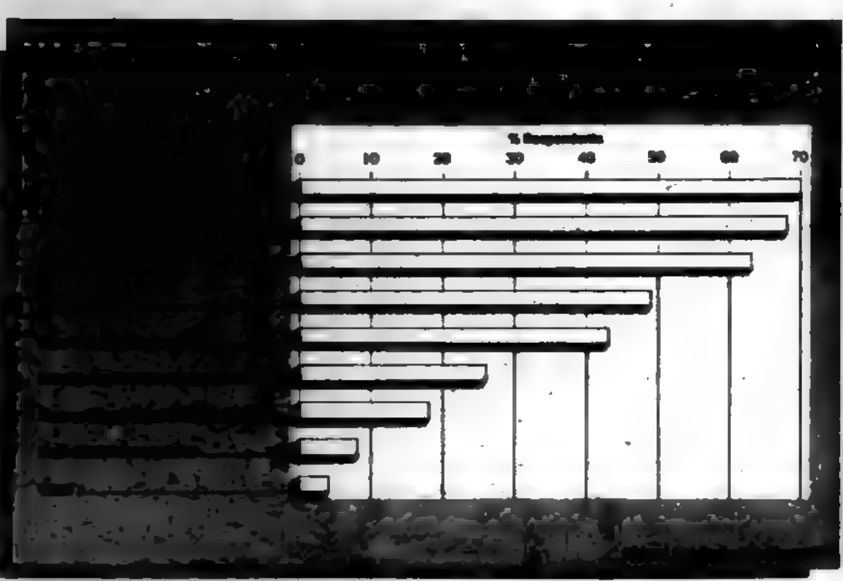
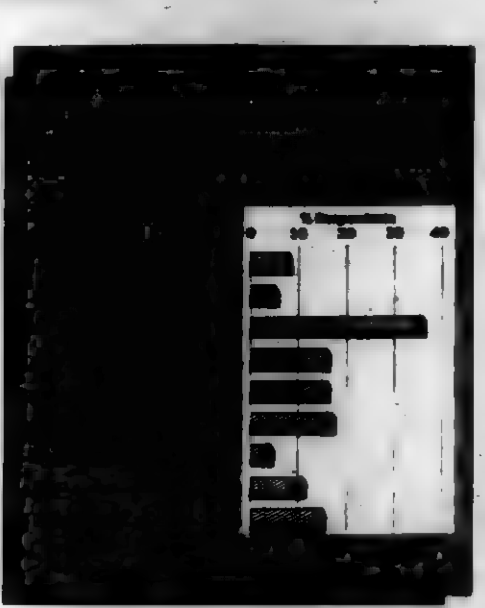
Software Thinking That's Impossible To Ignore.





POLL

from page 93

sibility to a different part of the organization.

Communications is becoming a high-level management concern. A quarter of the companies moved their communications function higher up the corporate ladder. Only one company in 12 placed that function directly below a chief executive officer. MIS managers are most often charged with overseeing telecommunications.

Respondents were unhappy with AT&T's service since divestiture. The most widely voiced complaint was finding the right person to solve a problem.

The report is available to Conference Board members for $15 and to nonmembers for $35. The Conference Board is located at 845 Third Ave., New York, N.Y. 10022.

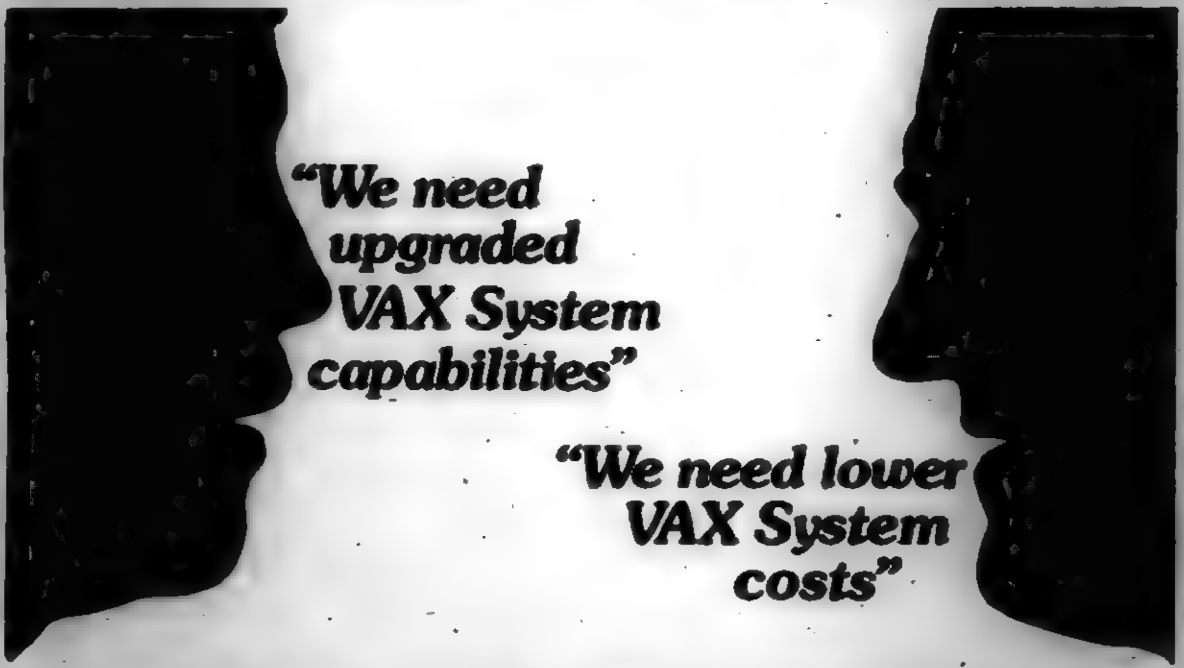
SERVICES

from page 93

If the recalled number is busy, Lass retries the number every 40 seconds for half an hour. If the called party answers within that time, the originator is notified with a distinctive ring.

- Selective call forwarding. This enables users with standard call forwarding to select calls to be routed to another location. To use the feature, users dial *63 or 1163 and enter the numbers of the calling parties whose calls will be forwarded.
- Distinctive ringing. By entering the telephone numbers of calling parties in the same manner as selective call forwarding, users can assign distinctive rings to certain callers.
- Nuisance-call rejection. As its name implies, customers can use this feature to block nuisance calls after they happen by hanging up and dialing *60 or 1160. Future calls from that number will be greeted with an announcement saying the call cannot be completed at the customer's request.
- Customer-originated trace. Drawing from nuisance-call rejection capabilities, users can also initiate call traces by dialing *67 or 1167. This routes the nuisance caller's number to the appropriate authorities where it is either stored in memory or printed.
- Call identification. With this feature, which requires the addition of a small display device, users can identify the telephone numbers of callers. This capability could be enhanced, the "Record" reported, to enable business customers to direct incoming calls to a computer that could display the number of the calling party as well as other customer information.
- Bulk identification. The former capability only identifies the caller's number while the call is in progress, but with bulk identification, business users can create a permanent log of incoming calls. This can be used to aid security by denying access to computer resources from certain numbers.

Charges for these services are based on usage rather than on a flat monthly fee. Some of the services, however, require the lease or purchase of additional hardware.



"We need upgraded VAX System capabilities"
"We need lower VAX System costs"

THEY BOTH CAN GET WHAT THEY NEED WITH

HAMILTON VAX SYSTEM RENTALS!

No Capital Expenditure Your capital is not tied up in depreciating equipment that is not directly earning revenue. Low rental costs can be approved immediately from departmental operating budgets.

Accounting Benefits Rental payments can be deducted for tax purposes while preserving credit lines. (Does not require balance sheet notation.)

Simplified Budgeting Paying for today's expensive equipment with tomorrow's devalued dollars at constant rates not subject to interest fluctuations.

Avoid Obsolescence Upgrade equipment at any time during the rental period. (Rental-with-purchase option plan is also available.)

Applications Software Full range of Office Automation, DBMS, CADD, Process Control and Utility Software can be included in the rental.

Hardware Configuring Hardware configuring of Floating Point Systems array processors, Tektronix, Hewlett Packard, Calcomp, Nicolet, Data Products and Printronix peripherals all integrated with the VAX rental.

Turnkey Solution All shipping, installation and manufacturer's maintenance are provided by Hamilton, who has installed thousands of systems worldwide.

Quick Delivery...from stock. Rental plan for as short as three months or as long as three years.

Adage unveils DEC-compatible color display workstations

Models target imaging, CAD/CAM applications

BILLERICA, Mass. — Adage, Inc. has announced three configurations of its Adage 3000 Color Raster Display System workstation that is used in conjunction with Digital Equipment Corp. PDP-11 or VAX-11 series processor under DEC's VMS operating system.

The Adage 3110 system was designed for computer-aided design and manufacturing and seismic applications, the vendor said. It includes a 1,024- by 1,024-pixel image, with more than 65,000 colors, and includes a 16-bit buffer.

The unit is expandable to a double-buffered 1,024- by 1,024-pixel by 24-bit image memory, 3M bytes of display list memory and 8K bytes of microcode memory, the vendor said.

The 3130 system is said to be useful for imaging and graphics applications. It includes a local graphics processor, 1M byte of display-list memory and quad-buffered 1,024- by 1,024-pixel by 8-bit image memory.

The image memory is software reconfigurable for 512- by 512-pixel full-color display with 256 overlay colors. Real-time video input is optional.

The 3140 system is designed for applications requiring real-time simulator display capabilities. It combines local graphics and transformation processors with a graphics generator module.

The 3140 is used with Adage's IDL2 software for display updates in response to changes in the simulator model, the vendor said.

The 3110 and 3130 systems, including Adage's FSS 3000 Fortran subroutine package and either its Seismic 3000 or Solid 3000 software, are each priced starting at $49,400.

The 3140, including IDL2 software, costs $58,200 and up.

More information is available from Adage, One Fortune Drive, Billerica, Mass. 01821.

Firm offers multiuser OA system

By Kathleen Sullivan
CW West Coast Bureau

SANTA CLARA, Calif. — Sensory, Inc., a fledgling company based here, has unveiled its first product, the Sensory Office System, a multiuser system said to provide voice, data and communications capabilities.

The Sensory Office System, which can support up to 32 users, is based on a proprietary operating system. At the heart of the system is the Sensory 5000, a network control unit built around two Intel Corp. 8086 microprocessors.

Sensory's workstations, which also include 8086 microprocessors, feature 512K bytes of random-access memory and 8K bytes of read-only memory. They can be attached to the controller via coaxial cable, the company said.

The system is said to include Sensory's

Hybrid process doubles speed of Hitachi chip

Hi-Bicmos method keeps chips from overheating

SAN JOSE, Calif. — Hitachi America Ltd. has announced a static random-access memory (RAM) chip that can hold 64K bits of memory — roughly 12,000 words — and has an access time of 25 nsec.

Previously, the company's fastest chip was the HM6287-45, with an access time of 45 nsec, a spokesman said.

The company integrated the bipolar process, which delivers high speeds but causes the chips to overheat, with the lower power Cmos process for what Hitachi is calling the Hi-Bicmos process. The process is said to operate at top speeds with power consumption of a few hundredths of a watt.

Hitachi expects the HM6787 static RAM chip to be useful in graphics workstations, computer-aided design and manufacturing systems, mainframe computers used in data base applications and computers used by banks, airline reservations and electronic publishing systems.

The HM6787 cost $68.50 each in quantities of 10,000, the vendor said.

The product will be available in fourth-quarter 1985.

More information on the static RAM chip can be obtained from Hitachi America, located at 2210 O'Toole Ave., San Jose, Calif. 95131.

Integration snags slow automation

SHOP TALK
George Allen

Although "factory automation" has become a common buzzword, the automated factory is almost nonexistent. This is because the heavy up-front costs and complex tasks that must be handled make automating factories a difficult and expensive proposition.

True factory automation involves many elements, including: robotics; computer-aided design, manufacturing and engineering (CAD/CAM/CAE); direct numerical control of machine tools; simulation of factory flows; material requirements planning (MRP); inventory management and distribution; and a host of other capabilities. The problem is integrating all of these elements, tying them into a centralized data processing environment. Communications, data base management systems and applications software hold these components together.

There are several major efforts under way that attempt to combine the powerful capabilities needed to approach factory automation. Many of the most significant advances are evolving out of CAD/CAM/CAE for use in such applications as automating the design and fabrication processes, which include sophisticated direct numerical control operations and robotics.

In order to become useful, factory automation will have to include richer and more complete product modeling, including solid modeling and the ability to store the geometry of the part fully in the computer. Other major trends will be the improvement in graphics devices and workstations and the emergence of telecommunications as a major component in the total system.

If automation is to work in a factory, the software community must adopt open systems architectures. If this happens, the death knell of closed turnkey systems will sound.

Closed turnkey systems, the hallmark of many second-generation CAD/CAM offerings, use special-purpose computers running operating systems dedicated to the CAD/CAM function. Such systems feature special-purpose terminals and closed data bases, making their use beyond the scope of the CAD/CAM environment ineffective,

See AUTO page 109

Allen is a computer-aided design and manufacturing specialist with the McDonnell Douglas Manufacturing Industry Systems Co., a network management products vendor.

IBM rolls out factory systems

BOCA RATON, Fla. — IBM has introduced the 7531 and 7532 industrial systems, based on Intel Corp.'s 80286 microprocessor.

The 7531 operates as a floor-standing unit, while the 7532 is a rack-mountable version. The systems are functionally identical and are said to provide protection against temperature extremes, vibration and shock, voltage transients and particulate contamination, IBM said.

The systems were designed for industrial applications, such as machine monitoring, production control and distributed numerical control.. Both models are equipped with a removable filter for dust collection and cooling fans said to protect the power supply and system components.

Standard features include 512K bytes of main memory, expandable to 3M bytes, a 1.2M-byte diskette drive and seven expansion slots.

Options include a double-sided diskette drive that permits exchange of 320K- and 360K-bit diskette media between the 7531, 7532 and the previously announced 5531 industrial computer and IBM Personal Computers, the company said.

The 7531 costs $6,145 and the 7532 costs $6,370, according to the vendor. Both will be available in the third quarter.

IBM, Manufacturing Systems Products division, P.O. Box 1328, Boca Raton, Fla. 33432.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

■ XYVision, Inc. has unwrapped Release 4 of its line of computer-integrated publishing systems.

The Release 4 line reportedly includes a Level 100 system for commercial and in-plant production for text editing and composition with pagination and file management.

The Level 100 system, including hardware and software, starts at $49,000. It includes two XYText terminals, 2M bytes of memory, a 70M-byte disk drive, a 1.6M-byte floppy drive, a typesetter interface and a single RS-232 communications port.

The Level 300 system provides interactive page make-up facilities, excluding batch processing. It costs $79,000 and reportedly contains one XYView terminal, a 70M-byte disk drive, 3M bytes of memory and a dot matrix printer.

The Level 1000 system for text handling costs $90,000 and provides an XYView terminal, an XYText terminal, 6M bytes of memory, a 70M-byte drive, a 9-track tape, a dot matrix printer and eight RS-232 communications ports. An optional laser printer costs approximately $15,000.

The largest system, the Level 3000, includes one XYGraphix terminal with tablet and puck and one XYText terminal, 8M bytes of memory, a 70M-byte disk drive for text and a dedicated subsystem 300M-byte drive for graphics, a 9-track tape, the laser printer, batch and interactive software, graphics editing software and a scanner interface. It costs $165,000.

XYVision, 52 Cummings Park, Woburn, Mass. 01801.

DATA STORAGE

■ Kennedy Co. has announced the Model 9600A tridensity ½-in. streaming tape drive. The unit is said to operate at 800, 1,600 or 3.2K bit/in. and can record data at 45 in./sec. in a start-stop mode and 100 in./sec. in a streaming mode.

The unit features an 8¾-in. profile, horizontal mount with front tape insertion, autothreading and autoloading to the beginning of tape marker, and the field engineering panel for diagnostics, the vendor said.

The 9600A incorporates capstan and tension arms for tape positioning. The unit costs $5,400 in single quantities, with discounts for OEM quantities.

Kennedy, 1600 Shamrock Ave., Monrovia, Calif. 91016.

TERMINALS

■ Daisy Systems Corp. has announced the Boardmaster design system, a workstation for designing printed-circuit boards. The unit runs on Intel Corp. 80286 microprocessor-based Daisy hardware.

The Boardmaster performs a range of printed-circuit board engineering and layout functions, a spokesman said. It includes general-purpose drafting facilities for the creation of final manufacturing drawings and performs component packaging, selecting components in a way that minimizes parts count.

Other features are an 86M-byte hard disk drive, a 19-in. color monitor and a bit-slice-based graphics accelerator. Boardmaster is compatible with the firm's Logician, Gatemaster and Chipmaster workstation lines.

The system is available as either the full-function, single-user Boardmaster or the dual-user Boardmaster-D, which houses two workstations in a single cabinet.

Th price for Boardmaster, scheduled for September availability, is $110,000. The Boardmaster-D costs $140,000, the vendor said.

Daisy Systems, 700 E. Middlefield Road, Mountain View, Calif. 94039.

■ Esprit Systems, Inc. has announced its ESP 6515 video display terminal, which emulates Digital Equipment Corp.'s VT220 terminal and is compatible with all DEC VT100 applications software.

The unit includes a 14-in. monitor, a tilt and swivel display, support of the VT100 Graphics and national character sets and 18 user-programmable keys that are shiftable to provide 36 functions.

The terminal costs $795.

Esprit Systems, 100 Marcus Drive, Melville, N.Y. 11747.

■ Xpoint Corp. has announced an IBM 3178-compatible terminal with an optional Ascii printer port for IBM 3287 emulation.

The Xpoint 178 is a 12-in. CRT that is coaxial plug-compatible with an IBM 3178 or 3278 model 2 terminal and an IBM 3278 typewriter-style keyboard. An Ascii printer port, which will allow any serial or parallel Ascii printer to perform 3287 emulation, is available on a model called the 178P.

The Xpoint 178 costs $1,295, and the 178P with printer support is an additional $1,495.

Xpoint, Suite 130, 5800 Oakbrook Pkwy., Norcross, Ga. 30093.

■ GTE Telenet Communications Corp. has released a network color graphics monitor for its Telenet system.

The Color Monitor views network operations with color graphics. Configuration, traffic levels, line performance and other operating parameters appear in a variety of geometric shapes and numbers as well as in solid, dotted and flashing lines, the vendor said.

The monitor costs $52,000 for the color CRT, keyboard and network management software.

GTE Telenet Communications, 12490 Sunrise Valley Drive, Reston, Va. 22096.

PRINTERS/PLOTTERS

■ CIE Terminals, Inc. has introduced enhancements to its currently offered CI-300 (300 lines/min) and CI-600 (600 lines/min) printers.

The CI-300+ and CI-600+ printers will retain the performance and features of the older models they are replacing. CIE will continue to support the CI-300 and CI-600 models.

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1983).
BIMSPOOR — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 80% of the I/O to heavily used POWER queue.
BIM-OCIS — Comprehensive problem analysis and display of operational CICS system. DOS and OS.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMWINDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMDIRY — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMCNSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available.
BIMMONITR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMSUBMIT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $800, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4381-2 system, on-site or remote.

Continued from page 106

Enhancements include a print head mechanism that employs fewer moving parts and is said to result in extended ribbon life. The CI-300+ and CI-600+ models also include an RS-232C data transfer rate of 19.2K bit/sec.; a serial receive buffer size increase from 448 bytes to 4K bytes; and RS-232C communications protocol compatibility. Synchronous data communications protocols are available as options.

The CI-300+ printer costs $4,495, and the CI-600+ printer costs $6,795.

CIE Terminals, 2505 McCabe Way, Irvine, Calif. 92714.

■ **General Business Technology, Inc. has introduced a 200 char./sec. matrix printer for IBM System/34, 36 and 38 CPUs.**

Called the 5222DP, the unit prints near-letter-quality output at 50 char./sec. It features an adjustable tractor feed with tear bar, an automatic single-sheet document feeder, bidirectional printing and user-programmable or host-selectable character fonts and styles. It also offers emphasized and/or double-strike printing and super- or subscripts.

The printer costs $2,995.

General Business Technology, 1891 McGaw Ave., Irvine, Calif. 92714.

■ **Kearsarge Industries, Inc. has released a serial/parallel version of its SX-60 multichannel switch/spooler which will connect four IBM Personal Computers to Centronics Data Computer Corp. parallel printers.**

The SX-60 serves up to four computer systems and feeds two printers. Any of the input systems can direct its output to either of the printers. Spooler buffer sizes of 8K, 32K or 64K bytes store from 2½ to 20 pages of dense, single-spaced text. Expansion boards can increase the spooler's buffer capacity to 512K bytes and 160 pages.

The standard configuration for the SX-60 is four serial computers in, two parallel printers out.

Prices start at $490 for an 8K-byte buffer size to $629 for 64K-byte buffer storage.

Kearsarge Industries, 12310 Pinecrest Road, Reston, Va. 22091.

■ **Spur Products Corp. has released an adapter that makes IBM 3211 or compatible impact printers and the Xerox Corp. 8700 laser printer compatible with IBM's System/34, 36 or 38.**

The USA/Twin-Ax Universal Subsystem Adapter gives the system the capability of printing up to 3,000 lines of shaped characters per minute with a 3211 or compatible printer or up to 9,240 lines of dot matrix nonimpact printing with a Xerox 8700 laser printer.

The adapter costs $6,000.

Spur Products, 13469 Beach Ave., Marina Del Rey, Calif. 90292.

■ **Dataproducts Corp. has introduced a shared resource, color dot matrix printer with 400 char./sec. draft mode speed, 100 char./sec. text-quality speed and 50 char./sec. near-letter-quality speed.**

Graphics on the Dataproducts 8250 are produced with a resolution of 240 by 240 dot/in. at a speed of 10 in./sec. Options allow users to store a combination of continuous forms, cut sheets and envelopes or labels within the unit and to switch from printing on one kind of paper to another within 30 seconds. A single bin paper cassette allows cut sheets to be fed automatically.

The basic 8250 costs $2,650 ($1,900 in OEM quantities of 100). Options cost $425 ($275 in OEM quantities) for the single bin paper cassette and $975 ($730 for OEM quantities) for the paper express feature.

Dataproducts, 6200 Canoga Ave., Woodland Hills, Calif. 91365.

■ **Optical Computer Systems, Inc. has announced the Model 928 Drafting Plotter, featuring an eight-pen carousel and capable of accepting drafting media up to E size.**

The Model 928 allows the operator to select roller ball, fiber-tip or liquid drafting pens in varying colors and line widths. Different types of media can be used.

The Model 928 uses RS-232 and IEEE 488 interfaces. The product costs $13,600.

Optical Computer Systems, 2880 Wilderness Place, Boulder, Colo. 80301.

They've earned their stripes.

The supplies that wear the IBM stripes must first prove themselves worthy of the distinction.

Before they can join the ranks of all those IBM supplies that have gone on to serve IBM customers so well, they have to meet some stiff standards.

Our IBM supplies have to pass a series of rigorous inspections and battle their way through a barrage of quality controls.

This means every time you buy IBM word processing or data processing supplies, you're assured of getting a supply product that's designed with the same advanced technology as IBM hardware.

Take our latest line of IBM Quiet™ Supplies developed for the IBM Quietwriter® Typewriter and Quietwriter® Printer. The "Quiet" electronic fonts,

FIRST

from page 105

proprietary Voicenotes feature, which allows users to embed voice comments in documents. Users insert voice notes into document files by speaking into a phone. A symbol then appears on the document indicating a note has been recorded.

In a standard configuration, Sensory's system includes Voicenotes, which can be used for standard voice messaging, and a variety of integrated applications, including telephone management, dictation, electronic mail and word processing.

Options include Microsoft Corp.'s Multiplan, a document processing program with form generating capabilities, a spelling checker and IBM's Binary Synchronous Communication 2780/3780 communications protocol. An IBM Personal Computer can be attached to the network through an RS-232 port, allowing users to transfer Ascii files between the Personal Computer and the Sensory Office System, the company said.

The Sensory 5000 controller is available in two basic configurations. A 16-user system with 56M bytes of formatted disk capacity, expandable to 112M bytes, sells for $22,995. A 32-user system with 150M bytes of disk capacity, expandable to 300M bytes, sells for $30,995. Each includes a 12M-byte cartridge tape drive for archiving, two asynchronous serial ports, two asynchronous/synchronous ports and two intercontroller communications ports, the company said.

The standard workstation costs $4,495, while a workstation with telephony equipment costs $4,995. Shipments are scheduled to begin in July.

Sensory is located at 2175 Martin Ave., Santa Clara, Calif. 95050.

AUTO

from page 106

inefficient and often impossible.

Open systems architectures, on the other hand, form part of a new generation of systems, which may become the building blocks for true factory automation.

Today's CAD/CAM/CAE systems rely on general-purpose computers and standard operating systems that allow specialized software to run alongside other applications. Terminals are usable for other applications because they are standard, off-the-shelf items or are provided with driver software.

One option that may improve integration of factory systems is compliance with the Initial Graphics Exchange Specification (Iges) and other exchange format standards to facilitate transfer of data between dissimilar systems without an uncontrolled proliferation of custom translators. Third-party access to a CAD/CAM data base can be supported through Iges or a direct subroutine interface. Access to workstation hardware and other utility packages can also be provided.

Telecommunications in CAD/CAM is growing in importance and will be increasingly essential to total factory automation solutions. With the advent of newer and better system architectures and the shrinking system footprint, it is becoming advantageous to distribute computer power for CAD/CAM and other applications.

Communications key

Communications with other data processing organizations and functions within the corporation is also a necessary requirement in maintaining open systems. CAD/CAM must be able to interface with a DBMS or management information system, as well as with MRP and bill of materials systems.

One means of assuring smooth integration of telecommunications — and thereby maintenance of an open systems environment — is adherence to the seven-layer Open Systems Interconnect model established by the International Standards Organization.

The nature of factory automation and its components will continue to be defined and refined throughout the '80s. As the vendor community pushes back the boundaries of automation with integrated systems, the equally forward-looking user will adopt management processes and select products and services that fit into his strategic vision of the future.

The convergence of these two efforts will produce the de facto automated factory as a logical extension of today's CAD/CAM systems.

printheads and thermal-transfer ribbons were developed and engineered together with the hardware to work as a team. The result is a unique print technology that "paints" ink onto the page.

We've made it our business to make supplies that inspire confidence day after day. So, the next time you're in the market for supplies, choose the ones that have earned the right to wear the IBM stripes.

More convenient ways to buy. To get the IBM supplies you need, contact an IBM supplies representative or visit an IBM Product Center or IBM supplies dealer. For the store location nearest you, or to place an order by phone, call IBM Direct 1 800 IBM-2468, Ext. 90.

Graham Magnetics' commitment is long term: to provide premium-quality permanent computer tape products to data processing managers worldwide. You know your data is a corporate asset worth protecting with the highest-quality, problem-free computer tape in the world. So if you're tired of "bargain" tapes with untimely, costly problems, call Graham.

Graham Magnetics: making sure that high-quality permanent magnetic media never becomes an endangered species.

COMPUTER INDUSTRY

The Yankee Group: Age and experience a plus

Market research companies are increasingly called upon to analyze the myriad product announcements and shifting business strategies of the computer industry. This week, Computerworld begins a five-part series profiling a handful of prominent market research firms.

By Peter Bartolik
CW Staff

BOSTON — Despite its relatively advanced age of 15, the Yankee Group, Inc. exploits an image of the brash, aggressive kid on the increasingly crowded block of market research and consulting houses.

Ignoring younger contenders, Howard Anderson's firm positions itself with the heavyweights of an earlier generation and sells itself as the provider of analysis and insight that adds value to factual data provided by others.

When he started out as a one-man operation in 1970, Anderson lied about his age, he said in a recent interview, because "who the hell wants to hear from a 25-year-old, a punk in pinstripes out of the Harvard Business School." Approaching age 41 in an era where young people with MBAs are a mainstay of the industries the Yankee Group covers, Anderson said he does not "have to put gray in my hair anymore," but he actively cultivates the image of the upstart competitor providing something more than the numbers that older firms crank out.

Commenting on the competition, Anderson positions his company with Dataquest, Inc. and International Data Corp. (IDC). Dataquest, according to Anderson, "has

Apple revamps for stability

By Kathleen Sullivan
CW West Coast Bureau

CUPERTINO, Calif. — With its recently announced reorganization, which included the demotion of its cofounder, Steven P. Jobs, Apple Computer, Inc. has taken a series of long-overdue steps to bring stability to its troubled operations, analysts said.

Industry observers applauded the company's moves. "John Sculley [Apple's president] and the board have moved to solidify the firm and make it more stable," said Tim Bajarin, an industry analyst with Creative Strategies Research International, a San Jose, Calif.-based market research firm. "It should have happened a long time ago."

Tandon wins first round

WASHINGTON, D.C. — Tandon Corp. has won the first round against three Japanese vendors that Tandon claims infringed on its patents for double-sided microcomputer floppy disk drives in products the Japanese firms imported into the U.S.

Administrative law Judge Sidney Harris recommended May 30 that Tandon be granted temporary relief from the impact of imports fr a Sony Corp., Mitsubishi Electric Corp. and Teac Corp. If the recommendation is upheld by the International Trade Commission (ITC), the three Japanese firms would be required to post a financial bond with the U.S. Customs Service on every shipment of floppy drive

See TANDON page 122

National Semi to cut staff 3.5%

By Clinton Wilder
CW Staff

SANTA CLARA, Calif. — In one of the most drastic work force reductions of the current semiconductor industry slump, National Semiconductor Corp. announced last week that it will lay off 1,300 U.S. and European employees during the next few months.

The company said the layoffs, its largest substantial work force cut of the current slump, will affect all levels of employees. The cut affects 3.5% of National Semiconductor's 37,000-member work force worldwide but a much higher percentage of its domestic and European employees. Approximately 600 people will be dismissed from the company's world headquarters, based here.

National Semiconductor also said it has scrapped plans to build a wafer fabrication plant in Portland, Ore. The company blamed both announcements on the lack of signs of recovery from the severe semiconductor industry downturn that began last year.

"The reality is that semiconductor market conditions have not shown significant improvement for the past year," said Charles E. Sporck, National Semiconductor's president and chief executive officer. "We now must come to grips with this fact and adjust the corporation's cost structures to reflect the current market conditions."

Sporck said layoffs were a last resort after the company had tried to cut costs over the past several months through plant shutdowns, a wage freeze and reductions in capital expenditures.

Earlier this year, National Semiconductor laid off 400 Salt Lake City employees and has been running a four-day workweek schedule at all European and North American facilities since mid-March [CW, March 18].

Good news and bad news from the industry grab bag

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

Although President Reagan's tax reform proposal contains generally good news for the computer industry, let's not forget that the ball now moves into the most divisive court of all — the U.S. Congress.

On the positive side, the proposal keeps computer depreciation schedules at five years, in contrast to an earlier proposal for writing off the expense in eight years; the capital gains provisions will maintain incentives for investing in new companies; and the R&D credit was extended for three years.

On the downside, some would say, is the proposed elimination of the investment tax credit. But good investments pay off, bad investments don't. Investment brings its own reward or punishment, depending on whether good or bad business decisions were made.

However, the White House has opened the doors to tinkering with the plan. By making certain concessions, such as to the oil industry, the proposal makes it that much harder for Congress to stand tall against "me too" demands from other industries. And a basically populist Congress is certain to shift more of the reform benefits to the middle class, further enhancing the climate for tinkering.

■

My, my, how forthcoming IBM is this year about earnings projections. At the end of May — for the third time in recent months — Big Blue issued a statement forewarning bad news.

The statement's missives, certainly out of character, hint of a damage control campaign. With the likelihood of two disappointing quarters under its belt and no indication as yet of an upturn in the industry, the prospect of IBM turning things around in the second half of the year seems to be fading.

■

Sterling Software, Inc. recently said that its data storage management system, DMS/OS, was selected as the standard disk management software system for all General Motors Corp. and Electronic Data Systems Corp. (GM's subsidiary) data centers. The contract gives GM and its subsidiary the right to install DMS/OS in all of their DP sites, Sterling Software said.

■

Genix Corp., the spin-off profit center and former part of National Steel Corp. [CW, May 20], recently announced it was granted an exclusive license to market the Programaster applications development package by Master Software, Inc. on a remote processing basis.

■

On the leasing side of things, privately held Capital Associates International, Inc. of Boulder, Colo., recently announced a $40 million revolving credit facility with the Mellon Bank, along with the participation of the First National Bank of Minneapolis and the Colorado National Bank of Denver. The credit facility will be used for working capital purposes and the short-term financing of equipment leases.

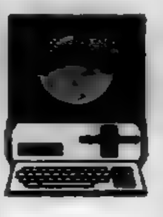
MART

from page 111

said the world is sand — silicon," while IDC takes the tack that mainframe computer installations are what is important. At the Yankee Group, according to Anderson, "we have said, being the new kid on the block, 'No. You're both wrong. The world is a communications link of which there are some interesting peripherals: [IBM] 3083s, memory, micros, minis, office automation, [computer-aided design and manufacturing].' "



Not mentioned was the fast-growing Stamford, Conn.-based Gartner Group, Inc. Locked in a bitter court battle with the Gartner Group over the hiring of a former Yankee employee and charging misappropriation of proprietary information, Anderson is seen by observers to be conducting a feud.

Anderson disdains to rank the Gartner Group in the same league. "We look at Gartner Group as primarily a Wall Street analyst; I mean, Gideon Gartner was a Wall Street analyst, Tom Crotty was a Wall Street analyst, and they know earnings projections or whatever," Anderson said, giving no mention to the technical staff at the Gartner Group.

It is a three-cornered ring in Anderson's view, with Dataquest dominating the semiconductor industry, and IDC dominating the numbers on processor installations. In the communications arena, he said, "we have probably, in our own minds, lapped the field; we have literally forgotten some things that [our competitors] are just discovering."

Anderson delineated a second tier grouping of Arthur D. Little, Inc. and the Stanford Research Center; on a third tier, he said, is the Gartner Group, along with Infocorp, "a growing company we have some respect for," and Quantum Science Corp..

In addition to U.S. offices here, in the Washington, D.C., area and in California's Silicon Valley, the Yankee Group has branched out internationally to the UK, Japan and Australia. The company has about 100 employees, including 10 sales representatives. Anderson claims 425 clients, including "every major vendor and the majority of smart large users."

Although the company is telecommunications focused, research is divided into an Information Processing Group and a Communications Industry Group, both of which offer four services, including a data communications module.

Each client is also provided with an on-line electronic mail and data base service, Yankeenet (also available separately), of which Anderson is particularly proud. "The biggest point that we are making now is that the smart user is going to extend his network to his suppliers and his customers," he said. "That's what we are doing with Yankeenet."

One client, Kerry Overian, director of Corporate Telecommunications and Office Automation for United Brands Co., said Yankee Group reports cover the full scope of a particular subject, and he values the option of phoning Yankee Group analysts, including Anderson, to elicit further information.

Additionally, he said, "the seminars in New York are generally good, and I get to meet a lot of other people in different industries." Also, Yankee Group analysts make presentations at annual meetings of United Brand's international managers, Overian said.

Mid-life transition

But there are signs that the Yankee Group is going through somewhat of a mid-life transition. Anderson said compound annual growth has begun to slow from the company's historic 60% rate.

Dale Kutnick, who said the firm became a two-man operation when he joined 7¼ years ago, earlier this year left his position as director of strategic services after a dispute with Anderson. Since then, he said, five senior people have also departed, including two IBM watchers who signed on with competing companies.

Kutnick said the Yankee Group historically was "able to bring relatively young, inexperienced people in and was able to [develop] them into decent analysts very quickly." With the departures of senior analysts, he added, the question is whether a young staff "can add enough meat" to standard research data.

Anderson countered that "there is a lot of body-snatching going on right now" and said he was in the process of hiring away an IBM analyst from a competitor.

Kutnick, while dismissing Anderson's brashness as a marketing ploy that gains attention, agreed that the firm's strength has been its attempts to find and define new markets.

Another former employee said the staff identifies with Anderson's image. "The corporate culture is very strong; they are somewhat the bad boys in the industry, always willing to offend anyone if the cause is right," said the former employee, who asked not to be identified. But he also said the Yankee Group "needs to put in mechanisms that are a little less Andersonian."

William Rosenberger, Kutnick's replacement and former director of product planning with Wang Laboratories, Inc., views his new company as an aggressive, leading-edge firm that provides crucial information before products are announced. "It is about like an early warning system of what's happening in the industry," Rosenberger said.

Distancing the Yankee Group from the competition, Rosenberger said, "Some players in this market are people who deal only in market data. Others deal with data and analysis. Yankee is the latter. We do primary research by survey and add a heavy dose of analysis."

The formula has apparently been successful. The *Inc.* 500 list, which has included the Yankee Group each of the past three years, in December estimated 1983 revenue at $10.1 million with profits of more than $1.6 million, estimates with which Anderson initially said he has no serious disagreements.

Kutnick, however, said 1983 revenue was more like $6 million, and 1984 revenue was about $7.2 million. Profits were more than $1 million in 1984, according to Kutnick, but he said revenue will probably be flat this year.

Anderson later said revenue estimates vary based on accounting assumptions. On a cash-in basis, he said, the company recorded $7.7 million in 1984 and expects to hit $10 million this year. May "was the best month we ever had," according to Anderson. Competitors, he charged, record as sales the fees that will be accruing in future years.

Another relatively new wrinkle is Anderson's creation of a venture capital firm, Batterymarch Ventures. Anderson said he sees no potential conflict of interest from owning equity in companies involved in the area the Yankee Group covers because the investments are relatively minute.

"We have said the reason for [the venture capital firm] is that we want Yankee Groupers attuned to new technology, and how you take that technology and incorporate it into a business strategy," he said. "My guys are just a lot smarter about new software, new hardware, new applications." Competitors have similar venture funds, he said.

Asked to pinpoint the company's greatest achievements, Anderson recalled a 1974 report, "The Unbundling of AT&T," predicting a successful U.S. Department of Justice antitrust suit and restructuring of the telecommunications industry and a second report, "The IBM Grand Design, SNA." He also pointed to early analyses of the OA market.

Anderson said he could not recall any major mistakes. "I think part of the reason that we've grown is we've been right; if you're constantly wrong, you don't stay in this business." Kutnick agreed, saying any

Stratus continuing to seek OEM pacts: president

By Clinton Wilder
CW Staff

BOSTON — Stratus Computer, Inc. has charted a new direction in the fault-tolerant computer market — a market that will change significantly in the coming year, according to Stratus President William E. Foster.

Foster, addressing shareholders at the company's annual meeting here recently, said Stratus will continue to seek OEM partnerships such as its unprecedented agreement with IBM, signed in January. He predicted that Big Blue's first foray into the fault-tolerant market would help Stratus not only because of its OEM sales to IBM but also because IBM's action elevates the status of the entire fault-tolerant industry.

"We have already seen some major potential end users who want to hear more about us since the IBM agreement," Foster said. "Anytime IBM enters a new market, people ask why."

Stratus, which had previously signed OEM agreements with major vendors such as Ing. C. Olivetti & Co. and Burroughs Corp. subsidiary Systems Development Corp., announced an OEM partnership with Digital Switch Corp. The multimillion-dollar deal calls for Digital Switch, based in Richardson, Texas, to incorporate Stratus/32 computers in its Network Control Center communications switching system. "Stratus has targeted the communications industry for aggressive marketing in 1985 and beyond," said John P. Morgridge, Stratus' vice-president of marketing.

"We feel the way you grow in the 1980s is by looking at different ways to leverage your sales force, primarily because of the increased cost of people," Foster said. "This summer, we will begin a major new campaign to develop third-party agreements."

Foster said alternative sales channels, such as OEMs and third-party software developers, currently account for 21.3% of Stratus' revenue. The only larger single-market segment is brokerage houses, which account for 24.1% of the company's sales. Stratus posted revenue of $42.1 million in 1984, making it the second largest fault-tolerant vendor, behind Tandem Computers, Inc.

Company officials refused to disclose the number of units that have been sold to IBM since the January agreement. "We have a very good working relationship with IBM," said Nicholas Bologna, Stratus' vice-president of product marketing, formerly an IBM employee for 13 years. "We're not involved in their marketing, but we expect they will move cautiously at first."

Stratus admits that the IBM agreement may not directly impact Stratus sales until 1986, and industry observers agree. "IBM has said [it] will not announce until the end of this year how [it] will utilize [its] sales force for the Stratus product," said Los Altos, Calif.-based analyst Omri Serlin, editor of "FT Systems," a monthly fault-tolerant industry newsletter. "The deal is a double-edged sword. It certainly enhances Stratus' reputation, but if IBM decides to market it aggressively, that could overwhelm Stratus' production capability."

Foster predicted that the demand for fault-tolerant systems will increase as the need for on-line transaction processing becomes greater. "Most new applications are on-line, which means the costs of system failures are much greater for the user," he said.

Stratus' first-quarter revenue of $15.2 million was double that of the year-earlier quarter. The company earned $1.5 million, or 9 cents per share, for the period ended March 31.

Disk vendors plan closings

Magnetic Peripherals, Inc. (MPI) will close a 450-employee disk drive plant, and Memorex Corp. will idle nearly all of its domestic operations for two weeks next month, it was announced recently. The two unrelated announcements signified the continuing slump in the computer peripherals business.

MPI, jointly owned by Control Data Corp., Sperry Corp., Honeywell, Inc. and Bull, will begin to close its disk drive assembly and test plant in Burnsville, Minn. Most of the 450 employees will be transferred to two MPI facilities in Bloomington, Minn. CDC, MPI's majority owner and managing partner, termed the move a "consolidation" and said CDC's Government Systems Division will move into part of the facility.

MPI also said most of its domestic operations will be shut down for two weeks beginning July 1. Many employees will be allowed to use the shutdown period as paid vacation time, the company said.

Memorex announced it will idle 90% of its U.S. operations for the same two-week period. The shutdown will close its large disk storage and communications peripherals manufacturing plant in Santa Clara, Calif.

MPI and Memorex said the actions were caused by sluggish demand for their disk drives.

TIME
is Money in Data Communications

☐ solve user RESPONSE TIME complaints
☐ analyze SYSTEM PERFORMANCE
☐ BALANCE DATA LINES in a user friendly environment

QUESTRONICS CPA/7 provides over 75 categories of line utilization and response time information in 11 different reports (hard copy and/or data based) in such areas as:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, the Data Com manager can make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for growth.

Terms of assurance: Lotus customer plan poses catch-22

OUTSIDE LINES
L. J. Kutten

A major problem in the computer industry is that small companies grow into big ones so fast that they forget the customer is the reason for their expansion and growth.

In the course of that growth, companies often develop something called "chutzpah." Chutzpah is a Yiddish word meaning gall. It is used to describe someone who does something so outrageous that it is unbelievable. Recently, Lotus Development Corp. did something that set a new record for corporate chutzpah.

Last month, I went to my local software store and examined Lotus' 1-2-3 package. The package was covered in shrink-wrapped plastic, and on the back was a page describing the program. At the bottom of the page was a paragraph titled "Conditions of purchase." It stated, in part, the following:

"This product is subject to limitations on warranty and permitted uses customary in the sale of microcomputer software for personal use. The details of such limitations are set forth in the Lotus Customer Assurance Plan which is available from Lotus or from your dealer."

Since 1-2-3 is an expensive program, and I am a cautious consumer, I felt it was reasonable to find out what these terms were before buying the program. I asked the dealer, and he examined his Lotus file. There was no copy of the plan in it. But according to my dealer, Lotus' Customer Assurance Plan stated in detail its policies on customer support and product upgrade.

It also explained the details of Lotus' "limited warranty." I then asked him to open up a shrink-wrapped package. He refused, saying that opened packages are harder to sell. If I really wanted to see it, I would have to buy the program.

Not wanting to be bound by an agreement I had not read, I declined his offer. I then tried two other authorized Lotus dealers and met with the same result; no one had a copy of the Customer Assurance Plan available for customer inspection.

Letter to Lotus

Taking Lotus' statement literally, I wrote a letter asking for a copy of the plan. One week later, a Lotus representative called and asked why I wanted the copy.

I replied that I had read the firm's conditions of purchase on the 1-2-3 package, none of the local dealers had a copy of the Customer Assurance Plan available for inspection and I wanted to know the terms of the agreement.

I was promptly informed that it was Lotus' policy not to mail out copies of its Customer Assurance Plan. While the representative would tell me its terms over the phone, the only way to get a hard copy was to buy the program.

This shocked me. Never before had any company refused to send me a copy of its product warranty. I do not know why Lotus refused. Maybe its Customer Assurance Plan is so one-sided that Lotus does not want me or any consumer to see it until we have made the emotional and financial commitment to buy 1-2-3.

All I can do now is speculate why Lotus refused and hope this policy does not spread to other software and hardware companies.

Editor's note: After completing this article, Kutten reported that on his fifth visit to a dealer, he was able to view a copy of the warranty.

Kutten is a frequent Outside Lines *contributor who specializes in computer law topics. He is a member of the Illinois and Missouri bars. His book,* Computer Buyer's Protection Guide, *was published last year by Prentice-Hall, Inc.*

Chip slump forces firms to cut staff

Two companies that sell capital equipment to semiconductor manufacturers recently announced work force reductions because of the continued slump in the semiconductor industry.

GCA Corp. of Bedford, Mass. laid off approximately 250 employees, or 7% of its U.S. work force, mainly from its Massachusetts-based semiconductor products division.

Fremont, Calif.-based Optical Specialties, Inc. (OSI), a maker of automated inspection and measurement systems for the industry, laid off more than 20% of its 240 employees. In the announcement of the 50 dismissals, OSI cited the recent cancellation of a $550,000 order and continued overall sluggishness in the semiconductor industry.

Industry recovery delayed

GCA President Richard D. Stewart said the company is scaling back its production rate of semiconductor-related components to 1984 levels.

According to Stewart, "GCA has recently seen mounting indications that the [semiconductor industry] recovery is being delayed and that substantial bookings of products [that] GCA had anticipated in the coming weeks are being delayed as well."

GCA announced the possibility of posting a second-quarter loss because of costs associated with the layoffs and the potential of shipping fewer DSW Wafer Stepper systems than originally planned.

The company expects to post profits in the third and fourth quarters, but not enough for 1985 results to match its earnings and sales of the previous year.

Sales to continue

Both GCA and OSI said they will continue with previously announced plans for selling to the semiconductor factory automation market. "Although most semiconductor manufacturers have temporarily postponed expansion plans, they are forging ahead with the next phase of factory automation," OSI Chairman and President Ken Snow said.

OSI said it expects sales in the third and fourth quarters to lag second-quarter revenue of $4.8 million.

In a related development, Wyle Laboratories, a maker of semiconductors as well as military and aerospace electronic components, reported a sharp drop in first-quarter revenue.

The El Segundo, Calif.-based firm said sales fell to $71.3 million from $93.1 million in the year-earlier quarter. Profits plummeted from $3.2 million, or 42 cents per share, in the first quarter of 1984 to $505,000, or 7 cents per share, for the period ended March 31.

AT&T, firms plan money services

NEW YORK — A joint venture to develop electronic banking and brokerage services was announced here last week by AT&T, Bank of America, Chemical Bank and Time, Inc.

The joint venture reportedly will develop, produce and market electronic banking and brokerage services as well as other electronic services to consumers and small businesses.

The services are expected to begin operation in New York and California this summer, after receiving regulatory approval, according to representatives for the companies.

Initially, the electronic banking venture will offer services to approximately 37,000 homes and small businesses that currently subscribe to Chemical Bank's Pronto service and Bank of America's Homebanking service.

Francis J. Heffron, executive vice-president of AT&T Technologies, Inc., was named chairman and chief executive officer of the venture.

Softech to sell micro subsidiary

WALTHAM, Mass. — Softech, Inc., a mainframe and micro software firm based here, recently announced plans to sell off its microcomputer software subsidiary, Softech Microsystems.

Softech has curtailed operations of the subsidiary, pending its sale. The company claims the decision will not affect continued product sales or sales support.

"Continuing this operation would involve a more intensive marketing effort and a greater degree of risk than Softech is prepared to undertake," said Softech President Justus F. Lowe Jr.

"We are exploring possibilities for selling or licensing our microcomputer product lines to a company which specializes in this market, such as a major brand-name supplier, publisher or catalog distributor," according to Lowe.

Softech said the decision would mean a loss of $4.1 million before taxes, or 48 cents per share, to be taken as a one-time write-off for the quarter ended May 31.

Anacomp reaches accord with creditor; loan reduced

INDIANAPOLIS — Anacomp, Inc. recently announced it had reached an agreement with its creditor banks, reducing its term-loan balance to $33 million.

Under the agreement, the maturity of the term loan was extended by 15 months to Sept. 30, 1987 and the interest rate was lowered by 1¼%.

Anacomp, which ran into severe financial difficulties in its attempts to develop a comprehensive banking software package, said the agreement will reduce its annual interest expense by more than $2 million.

Louis P. Ferrero, chairman and president, said the agreement demonstrates creditor confidence in the company and "enhances our prospects [for] continued overall earnings improvements."

Cullinet, M&D bout continues

NATICK, Mass. — Round 2 is under way betwen McCormack & Dodge Corp. and Cullinet Software, Inc. over M&D's proprietary G/L Plus general ledger software.

A counterclaim has been initiated by M&D after an original suit was decided in its favor. Cullinet, which had filed the original suit, is in the process of appealing the Massachusetts Superior Court's ruling. M&D is now seeking to cancel its entire agreement with Cullinet, an M&D spokesman said.

Cullinet originally sublicensed the G/L Plus software in 1981 from M&D, which provided them with version 1.7.1 of the system. M&D, however, only agreed to allow Cullinet to sell the system to users of Cullinet's IDMS system within the U.S. and Canada, according to Frank Dodge, M&D president and chief executive officer.

The dispute centers on Cullinet's practice of selling the software overseas, Dodge said. Soon after the complaints began, Cullinet sued for a declaratory statement against M&D, claiming the 1981 deal entitled Cullinet to promise international clients the G/L Plus software as of 1986 — five years from the date of the original pact. After the court's scrutiny of this agreement, M&D emerged victorious on the merits of its original pact with Cullinet.

What will happen to users who bought the G/L software from Cullinet? "They will not be affected," said Cullinet spokesman Bob Hughes. Furthermore, Hughes said, "We will have a general ledger available for the international market." Hughes refused to comment on whether Cullinet would invest or buy its general ledger.

accused of revolution.

The new Genicom 4000 offers revolutionary performance.

Fast, quiet and reliable, the Genicom 4000 offers 300 or 600 lpm with data processing and letter quality printing, bar codes, line and block graphics, plus more. The Genicom 4000 establishes a new standard by which other line printers will be measured. It is a standard of excellence never before achieved.

The new Genicom 4000 keeps things quiet.

With a standard cabinet that allows operation at less than 60 dB(A), you'll find the Genicom 4410 is quiet enough for virtually any office.

And since Genicom 4000 printers are built into their own standard sound suppression cabinet, you won't have to pay up to 20% extra for an additional quietized cabinet . . . often required with competitive printers that only appear to cost less at first.

Of course, if you have an especially demanding quiet application, Genicom also offers an optional 55 dB(A) sound deadening package that can be added to our standard cabinet.

The new Genicom 4000 refuses to break under pressure.

In a reliability test, the Genicom 4000 shuttle mechanism worked 24 hours a day non-stop for two and a half years without failure . . . the equivalent of 20 years normal operation.

This extraordinary reliability is the result of a totally new, patented resonant shuttle mechanism that's perfectly balanced, innovative in design and free of the moving parts that break down in other line printers.

The new Genicom 4000 offers you a big payoff.

The Genicom 4000 is so remarkably maintenance free, it can save enough to pay for itself. There's no preventive maintenance. Sources of costly service calls have been eliminated. And replacement parts like the print actuators are operator replaceable.

We feel the new Genicom 4000 is going to beat the competition.

But you be the judge. Call our Toll Free number for more evidence. And if you're interested in tabletop serial dot matrix printers for everything from personal computers to main frames . . . word processing to data processing, ask about our other Genicom printers.

You Be The Judge.

Dataserve announces 5% 1984 revenue dip

HOPKINS, Minn. — Dataserve, Inc., a lessor and marketer of new and used IBM equipment, recently announced 1984 worldwide revenue of $109.9 million, down 5% from $115.9 million in 1983. The company said the decrease was primarily due to a shift in recording revenue from leases.

Profits for the year were $2.1 million, or 8 cents per share, up from $1.3 million, or 7 cents per share a year earlier, according to Dataserve.

Dataserve said it shifted its leasing business from sales-type leases to operational-type leases, resulting in revenue being recognized over the term of the contract rather than at the inception of the lease.

Of the total revenue, $45.5 million was generated by European activities, where the company operates under the name of Premier Computer.

NICKELS AND DIMES

The Telex Corp. reported revenue for the fourth quarter ended March 31 of $172 million, compared with $94.4 million in the same quarter a year ago. Profits after income taxes were $15.7 million, or $108 a share, compared with $1 million, or 60 cents per share, in the corresponding period a year ago.

■

T-Bar, Inc. announced revenue for the first quarter ended March 31 of $9.5 million, compared with $9.8 million a year ago. Profits were $310,000, or 7 cents per share, compared with $624,000, or 15 cents per share in the same quarter one year ago.

■

Uccel Corp. reported revenue for the first quarter ended March 31 of $46.1 million, compared with $39 million in the like period last year. Profits were $1.5 million, or 9 cents per share, compared with $619,000, or 4 cents per share a year ago.

■

Kearney-National, Inc. announced revenue for the first quarter ended March 31 of $51.8 million, compared with $49.7 million in the prior year. Profits from continuing operations for the first quarter were $2.4 million, or 43 cents per share, compared with $2.6 million, or 46 cents per share in the comparable period last year.

■

Symbolics, Inc. reported revenue for the third quarter ended March 31 of $18 million, compared with $10.4 million a year ago. Profits were $1.2 million, or 6 cents per share, compared with $132,000, or 1 cent per share in the like period one year ago.

■

Protocol Computers, Inc. reported a net loss for the second quarter of $325,000, or 6 cents per share, on revenue of $2.7 million, compared with a net income of $420,000, or 8 cents per share, on revenue of $4.5 million for the comparable period of a year ago.

■

Boole & Babbage, Inc. announced the final unaudited results of operations for the second fiscal quarter ended March 31. The company reported a loss of $407,000, or 13 cents per share, on revenue of $7.3 million, compared with profits of $468,000, or 16 cents per share, on revenue of $7.5 million in the comparable period one year ago.

■

Ask Computer Systems, Inc. reported revenue for the third quarter ended March 31 of $19.1 million, compared with $17.5 million in the like period a year ago. Profits were $1.7 million, or 14 cents per share, compared with $1.7 million, or 15 cents per share last year.

■

Equitable Life Leasing Corp. announced revenue for the three months ended March 31 of $38 million, an increase of 52.9% over revenue of $24.9 million in the corresponding quarter last year. Profits were $2.9 million, a 23.3% increase over $2.4 million reported in the comparable period one year ago.

MART from page 112

failures were more a matter of wrong timing, such as predictions of growth in local-area networks. However, Kutnick said, "These things are so hedged by all the research companies that any major errors are somewhat blanched."

Anderson professed a degree of frustration with the speed with which vendors and users progress technologically but admired the development of microcomputers and related software. "We are always frustrated that the users aren't making the decisions as rapidly as it becomes obvious to us that they [should]," he said.

INSTALLING A SERIES/1
SNA, BSC OR LCC NETWORK?

Let SSCP do the job—the whole job—for a fraction of what it would cost you to do it yourself. We manage the complete installation of your Series/1 network by providing your application programming staff or end users with a development-ready or production-ready Series/1 operating environment.

SSCP offers:

- In-depth expertise in EDX, CF and the major communications protocols supported in the Series/1, including SNA, BSC and LCC
- Extensive experience in small- and large-scale Series/1 system and network installations
- Installation planning and site preparation assistance
- System and network validation, performance evaluation and tuning
- Complete Series/1 system and application software installation and customization
- In-house training
- Optional ongoing maintenance contracts
- System backup/recovery/maintenance procedures and utilities oriented toward non-technical Series/1 maintenance personnel
- Free fixed-price estimates

Honeywell adds systems service

SAN JOSE, Calif. — Honeywell, Inc. reportedly will provide nationwide service for the complete line of Convergent Technologies, Inc. computer workstations and multiuser systems, it was announced recently.

The companies signed a multiyear contract providing for on-site maintenance for all Convergent Technologies hardware products and toll-free user access to Honeywell's National Response Center.

Paul C. Ely Jr., president and chief executive officer of Convergent Technologies, said the pact will make his company's products more attractive to OEMs with limited service capabilities.

Honeywell's third-party service program has 3,700 service technicians in more than 250 locations.

Eikonex accepts Kodak stock bid

ROCHESTER, N.Y. — Eastman Kodak Co. recently announced that shareholders of Eikonix Corp. had voted to approve Kodak's proposed acquisition for $16.12 per share.

Eikonix, the Bedford, Mass.-based manufacturer of digital image processing equipment and computer-aided electro-optical systems, will operate as a wholly owned subsidiary of Kodak's Commercial and Information Systems Group. Saul Kurlat, president and chief executive officer, and Jack D. Finley, chairman and executive vice-president, will remain with Eikonix in those capacities, Kodak said.

AIM facilities shut down for two summer holidays

MILPITAS, Calif. — Applied Information Memories (AIM) recently closed its corporate offices and one manufacturing facility for one week and will close again for the week of July 1.

Donald Brosnan, president of the disk drive manufacturing company, said the action was triggered by the "need to get our expenses more closely in line with our revenues." Brosnan said that the shutdowns were an alternative to employee layoffs.

AIM's manufacturing plant, located in Round Rock, Texas, as well as the corporate offices located here were closed during the holiday week of May 27 and will close again the week of July 1 because of the Independence Day four-day workweek. Employees reportedly are being paid for the two holidays.

The three-year-old disk manufacturing firm employs 125 workers in the Texas plant and 68 workers in the offices located here. The venture capital-funded company said it has received contracts totaling more than $55 million in the past three months for its new 5¼-in. disk drive, the Dart-130.

ACM appoints Hespos director

NEW YORK — The Association for Computing Machinery (ACM) recently appointed Richard F. Hespos as executive director.

Hespos is a former vice-president of DP, strategic planning, real estate and administrative services for Continental Corp. Hespos had previously served as vice-president of technology at Dun & Bradstreet, Inc. and was a management consultant for McKinsey & Co. He is on the board of directors of Quotron Systems, Inc.

Hespos will replace Sidney Weinstein, who retired from ACM after 10 years of service.

New York-based ACM is an educational and scientific society comprised of more than 75,000 computer specialists.

TANDON

from page 111

products into the U.S.

The ITC must decide on Harris' recommendation within 90 days. Tandon said it expects the ITC to follow the judge and grant temporary relief, pending Harris' decision on permanent relief by the end of October.

In past patent infringement cases, the ITC has required accused firms to post bonds as high as twice the value of their import shipments.

The current case is the second international trade complaint filed by Tandon this year.

The Chatsworth, Calif.-based firm had earlier charged several Korean disk drive companies with misappropriation of trade secrets, industrial espionage and other unfair trade practices.

Harris ruled in April that he believed there were no grounds for the charges, but the final decision is still pending before the ITC.

Tandon has been hit hard financially in the last two quarters, losing a total of $36.3 million on sales that fell more than 20% from the six-month period a year earlier. The company has announced plans to lay off 370 employees, thereby decreasing its domestic work force 25%.

My, how printers

MOST EPSON PRINTERS HAVE BEEN RUNNING LONGER THAN MOST PRINTER COMPANIES.

In this age of rampant office automation, Epson® printers seem to be one of the few things that never break down. This reliable, worry-free performance has been characteristic of Epson ever since we developed the first low-cost printer 20 years ago. No other printer or printer company comes close to such proven, long-term reliability.

Which is why most of our printers have been operating longer than most printer companies. And will probably continue working after many of them have stopped.

The most forgettable printer you ever bought.

The main reason corporate MIS departments think so much of Epson printers is that once they're bought, they rarely have to give them another thought. With an estimated 5 million lines between failures. And 100 million characters between new print heads.

They're easy to use, many with simple push-button typestyle controls, so you won't be hearing those complaints or frantic calls for help.

The ribbon cartridge is very easy to put in and take out. No muss. No engineering degree required.

And Epson printers are famous for being able to take those odd little bumps and crashing falls that render other equipment useless.

As for our full year warranty, well it's reassuring to have. But nobody seems to need it.

FULL COMPATIBILITY WITH MANAGEMENT INTERESTS.

Not all printers work with all computers. Or all software.

This incompatibility can be avoided if you're just matching one printer to one computer. But it can cause real problems if you ever want the flexibility to hook that printer up to a different computer.

Since Epson is the world standard for printers, virtually all major hardware and software is designed to work with our printers. From IBM® to the newest name on the market—which means you can be sure you'll be able to put your Epson printer to use where you need it, when you need it.

NO

For most people, reading a printer manual is like hard labor. But it's important if you want to get the most out of your printer. We've been working to make our manuals as user friendly as our printers.

ASK shareholders file suit, cite misleading statements

LOS ALTOS, Calif. — Two shareholders have sued Ask Computer Systems, Inc., charging the company with releasing misleading statements about the company's financial condition.

In two separate suits filed recently in U.S. District Court in San Jose, Calif., the shareholders, Edward Fain and Stuart Wechsler, claimed that in a prospectus for a $1.6 million stock offering in February, Ask presented itself as a "healthy, growing company," and failed to include information about product shipping delays that reportedly contributed to a third-quarter revenue slip. Ask revealed in April that its third-quarter revenue would be lower than expected.

Revenue for the third quarter ending March 31 was $19.2 million, down from second-quarter revenue of $21.2 million. Third-quarter profits were $1.7 million, or 15 cents a share, compared with year-earlier earnings of $1.8 million, or 14 cents per share.

In a prepared statement Ask Chairman Sandra Kurtzig said, "The company intends to vigorously contest the action."

APPLE

from page 111

In a prepared statement released May 31, Sculley said Apple plans to streamline its operations and "create a more efficient organization" by merging its Apple II and Macintosh product divisions.

With the consolidation, Jobs, who founded Apple with engineer Steve Wozniak in the late 1970s, lost his position as general manager of the Macintosh division.

'A more global role'

Jobs, who remains chairman of the board, will take on "a more global role in new product innovations and strategies," Sculley's statement said.

Del Yocam, formerly general manager of the Apple II division, was appointed to oversee the firm's product operations worldwide. In his new position, Yocam will be responsible for manufacturing, product development, operations management and distribution for all Apple products.

Analysts predicted that the consolidation will help alleviate the negative competition that reportedly existed between the two divisions. "Obviously, anything that will take away from that internal strife is a big plus," Bajarin said.

In his announcement, Sculley said the reorganization would allow Apple to focus its resources on its two primary markets: the education market and small- to medium-size business market.

Peter Teige, an industry analyst with Dataquest, Inc., a San Jose, Calif.-based market research firm, said Apple appears to be downplaying its much-publicized attempt to break into the corporate market.

Teige said the decision is a sound one. "The reorganization is a really good move for Apple because it is pointing to its market strengths," Teige said. "The company hasn't given up on the corporate market, but at least in the short term it is emphasizing its strengths."

Company playing to its strengths

The company is also playing to its strengths by moving Jobs out of day-to-day operations, according to Teige. "I think he has shown himself to be a very able leader in managing innovative technology and bringing it to market," Teige said. "It's hard to know ego-wise what the change will mean to Jobs, but for Apple it could be very positive," he added.

Apple's recent announcement is the firm's latest move to cut costs and improve the company's management. In recent months, Apple has laid off more 1,600 workers, closed its factories for a week, discontinued its Lisa computer and closed the doors of its disk drive production plant.

In addition to coping with internal problems, Apple, like other personal computer companies, is struggling to survive the current industry slowdown, the analysts said.

"With the situation Apple is in, it needs margin and profit from wherever it can get it," said Ralph Gilman, an analyst with Infocorp, a Cupertino, Calif.-based market research firm.

"It has to get itself focused on getting its products out to market and getting its dealers selling the Macintosh Office. If this reorganization helps Apple do that, it's a positive development," Gilman said.

LAYOFF

from page 111

The company said it would furnish several services to help its dismissed workers find new employment.

James Barlage, a semiconductor industry analyst with Smith Barney, Harris Upham & Co., said the National Semiconductor announcement may bode ill for other chip companies that had also previously resisted layoffs.

"Many of the [San Francisco Bay] area companies have been reluctant to lay off people because the people tend to evaporate," Barlage said. "So this is really a lag response to what's been happening in the industry.

"I don't think we're going to see much improvement until the fourth quarter at the earliest, and we could well go through most of next year the same way," he said.

Epson *do* go on...

& *for* SPEED *readers*

With characters per second you're looking for, one of these five Epson printers is probably just your speed.

The FX series dot matrix printers. 160 cps draft. 32 cps Near Letter Quality.

The LQ-1500 dot matrix printer. 200 cps draft. 67 cps Letter Quality.

The SQ-2000 ink jet printer. 176 cps draft. 106 cps Letter Quality.

The JX-80 color printer. 160 cps draft. 32 cps Near Letter Quality (optional).

The HS-80 portable ink jet printer. 160 cps unidirectional draft. 32 cps Near Letter Quality.

HARD COPY
DECISIONS MADE EASY

Epson's on-going line of dot matrix, daisywheel, ink jet, and thermal transfer printers and plotters sets the standard for the entire industry. The more you know about them, the easier your printer decision will be.

The New Standard. The Epson FX series have set new standards as the workhorses of the industry. With print speeds of 160 characters per second in draft mode, easy access to Near Letter Quality, a 20% increase in throughput, and excellent graphics, they're the number one selling printers from the number one printer company. For spreadsheets and financial reports, there's a wide carriage model.

"So the question is: 'Which Epson?'"

The Complete Printer. For speed, versatility and quality, there's nothing like the *LQ-1500.* Featuring a 24 pin printhead, its type rivals an office typewriter, at four times the speed of the average daisywheel. In draft mode, the LQ-1500 flies at 200 cps. And its graphics are among the highest resolution of all dot matrix printers.

The Strong Silent Type. The Epson performance alternative for sound-sensitive work environments is the quiet new SQ-2000 ink jet printer. This state-of-the-art printer uses 24 ink jet nozzles to produce letter quality print on virtually any paper. It combines both high speed and high quality. It speeds through wide carriage spreadsheets at 176 cps, in draft mode. And produces beautiful letter quality originals at a remarkable 106 cps. As with all Epson printers, it offers a full year warranty.

Epson printers
are used
by more major
companies
than any other
printer
in the world.

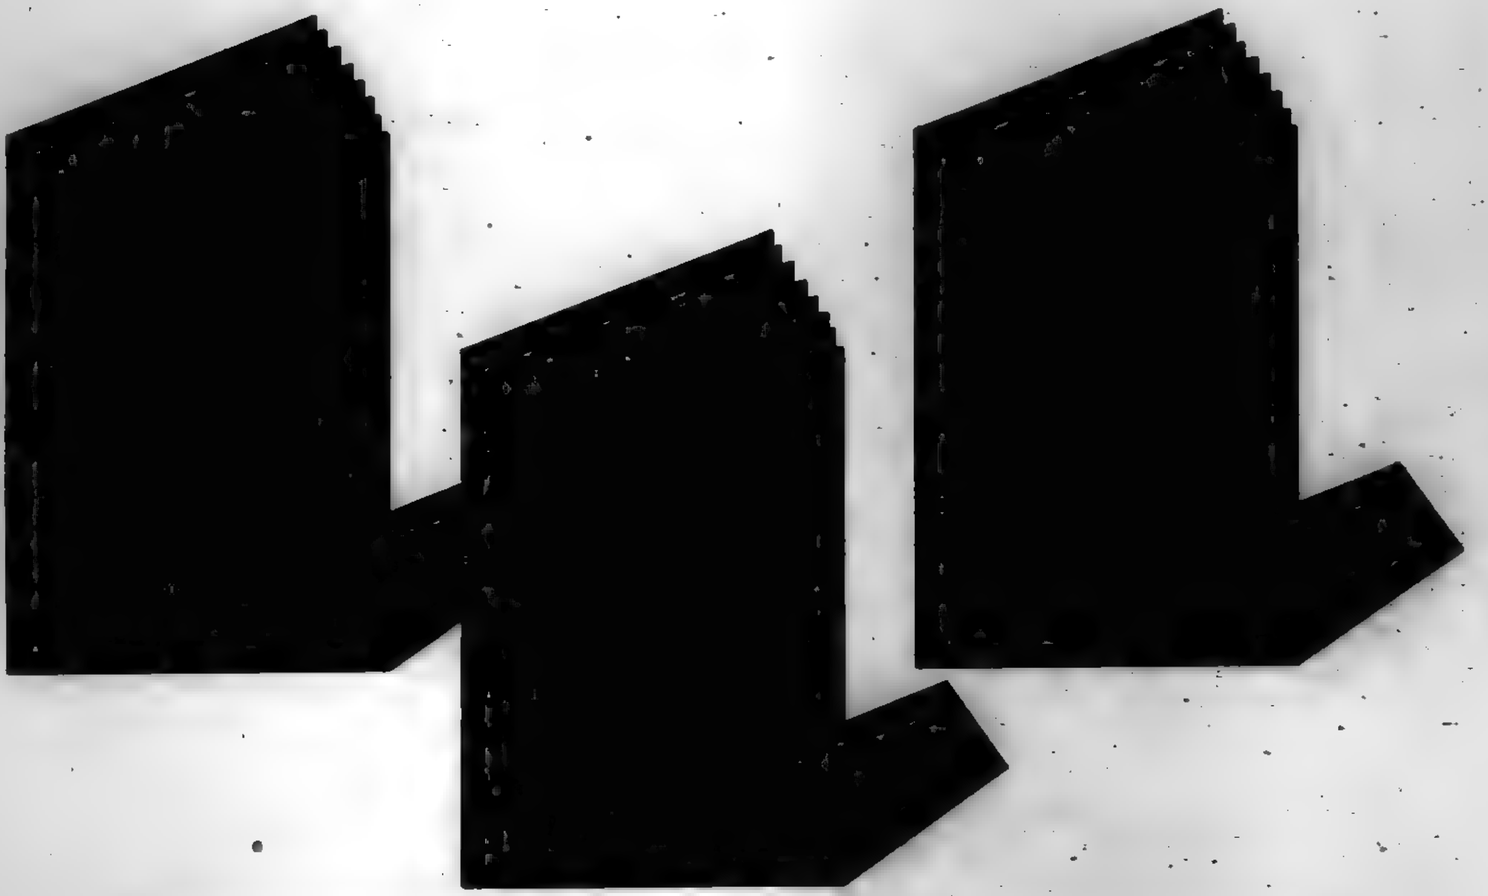
How to make NCC *really* work for you



Thousands of your customers and potential clients will go to NCC this summer (in Chicago, July 15-18). And hundreds of thousands more will follow the show by reading Computerworld.

We'll provide our readers with complete coverage of NCC in three special issues — the July 8th Preview issue, the July 15th Show issue, and the July 22nd Wrap-Up issue. Our editors will showcase the new products; report on the major speeches and seminars; and take a look at industry trends of interest to our readers.

Advertise in these issues now to keep your company and your products in front of more than 687,000 computer-involved professionals all during this eventful period.

And be sure to tell the attendees how to find you at the show. Advertise in Computerworld's *NCC Daily!* — NCC's most popular newspaper. We'll publish four separate daily issues, and distribute 25,000 copies each morning of the show. So you'll reach your target audience just as they're deciding which booths to visit.

Protect your investment in NCC. Call your local Computerworld representative today to reserve space for your NCC campaign. Or call Ed Marecki, Vice President of Sales, at (617) 879-0700. Call now. These issues will be closing soon:

Issue	**NCC Preview**	**NCC Show**	**NCC Wrap-Up**	**NCC Daily!**

ROBERT HALF
of Nashville
1101 Kermit Dr., Ste 407
Nashville, TN 37217
(615) 361-4000

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if...

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply CICS experience and for persons to apply MVS/XA knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS** Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS** Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.
- **Senior System Software Analyst—CICS** Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE.

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Central and South West Corporation

P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $3 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

Model 204 Data Base Specialist

Bring your career to refreshing Oregon.

Portland, Oregon is one of the most refreshing cities you'd ever hope to encounter. Clean air, a fine blend of architecture, and plenty of green, combined to make it an unusually inviting urban environment. It's here that Portland General Electric (PGE), an investor owned utility company, works at providing the most progressive energy programs to a growing community.

We have an immediate career opportunity for an individual with at least 2 years of current experience using Model 204. Our current environment is an IBM 3033 and 3032 running VM and MVS with CICS, VSPC and Model 204.

The Data Base Specialist, who reports to the Data Administrator, is in a technical position responsible for DBMS products (Model 204, PC/204, Dictionary/204, Developer, Painter and logical data design products). You will provide technical support for individuals who develop applications using data base products; new release evaluation, conversion and training; problem identification and resolution; vendor liaison on technical issues; and performance monitoring.

We offer competitive salary and attractive benefits. Please send your resume and salary history to:

the Cray style...

Starts With You.

Cray Research, Inc., the world leader in the design and manufacture of supercomputers, has immediate opportunities for highly motivated professionals in Minneapolis, St. Louis, Chicago, Champaign/Urbana and Detroit. Strong customer relation skills are critical for these positions, as are good oral and written communication skills.

SENIOR UNIX ANALYST

An opportunity exists for a Senior Analyst with 2-3 years Unix Kernel development experience to work on the Cray-2, the world's most advanced supercomputer at the University of Minnesota. Experience in migration of applications and networking is a definite plus. This position represents a unique opportunity for the right individual to play a key technical role within the central region.

OPERATING SYSTEM SITE ANALYSTS

These qualified candidates will be responsible for installation and maintenance of Cray software and will provide customer technical support. 3-4 years of experience in FORTRAN, Assembly Language, and Operating Systems Internals is required. Experience in vectorization and optimization of FORTRAN code is a significant plus. Experience in an IBM MVS/VM, CDC CYBER, or DEC VAX/VMS environment is preferred.

APPLICATION ANALYSTS

Responsibilities include installation, maintenance, and user support of application software on Cray machines. 3-5 years of FORTRAN experience is required with emphasis in any of the following areas: Finite Element Analysis (NASTRAN, ANSYS), Solids Modeling (CATIA, CAD/CAM), and Computational Fluid Dynamics.

Cray Research offers an excellent compensation package including profit sharing and salaries commensurate with experience. For confidential consideration, submit a resume outlining your qualifications and salary history to:

THE PLACEMENT PEOPLE

MOVE AHEAD WITH COMPUTERWORLD

More computer people read Computerworld than any other newspaper in the United States– more than half a million computer people every week. And, among our readers at user organizations, about half claim to look at recruitment ads at least every other week (only a small percentage say they never look at recruitment ads). No wonder Computerworld carries more recruitment ads for computer people than any other publication.

PLEASE DO NOT APPLY

unless you're looking for unique challenges

C.I.S., Inc. has immediate openings for highly qualified and motivated individuals who are ready to participate in the development of the next generation of software systems.

If you're one of the people we're looking for, you already know that hard work and dedication bring many rewards.

We are currently filling three staff levels:

PROJECT LEADER/SUPERVISOR

Experience: You should have a minimum of three years' experience as a project or team leader of a software development group. Some knowledge of networking and communications is desirable.

Duties: You will be responsible for the entire project, including all of the people working directly on the project. You will work with analysts to develop complete specifications for projects, and you will report directly to the head of research and development.

PROGRAMMER/ANALYST

Experience: You should have a minimum of two years' experience as an analyst, with some responsibility coordinating and supervising programmers. In addition, you should have a minimum of three years as a programmer working in 'C' language, although we will cross train you if you have Pascal or Assembler language experience. Some knowledge of networking and communications is desirable.

Duties: You will work with the Project Leader to develop systems specifications, supervise and provide technical support to the programmers, and do some programming yourself.

PROGRAMMER

Experience: you should have at least one year's experience as a programmer. Although all programming will be in the 'C' language, we are willing to cross train you if you have Pascal or Assembler language experience.

Our compensation packages will be designed to reflect the challenges and opportunities and to attract the qualified individuals wanted. To apply, please send your full resume, in confidence, to:

Get your money's worth.

Computerworld will lower your cost-per-hire.

When you're looking to fill MIS/DP positions, there's really only one place you need to advertise. Computerworld.

In every major market, Computerworld reaches more data-processing professionals than the local recruitment media. And we reach them for less.

Over 600,000 computer-involved professionals receive Computerworld every week. That's more than any other computer trade journal, business publication, or general-interest magazine.

Computerworld delivers quality readership, too. Fully 41% of our subscribers read Computerworld's recruitment section every week. And 95% of our subscribers read this section regularly.

That's why over 4,000 organizations ran more than 6,500 recruitment ads in Computerworld in 1984. The openings they advertised for cover the whole gamut of MIS/DP positions – including systems analysts, computer science & software engineers, directors of MIS/DP, programmers, sales managers, and systems managers.

As a matter of fact, recruitment advertising has made Computerworld the national leader in classified advertising among specialized business publications (according to *Business Marketing* magazine).

Compare costs and the people reached. You'll find that Computerworld is the number one medium for computer-related recruitment advertising.

Find out how we can lower your cost-per-hire. Get your copy of our "1985 Quick Reference Rate Card." Call toll-free (800) 343-6474. In Massachusetts call (617) 879-0700. Call now. We'll help you find the people you need.

ACCESS YOUR GROWTH OPTIONS

Transamerica Information Services is offering a wide range of challenging opportunities to individuals seeking a stimulating and highly progressive work environment. We're a subsidiary of Transamerica Corporation providing data processing and voice communications services to Transamerica affiliate companies. The following positions are available for professionals possessing strong interpersonal, analytical and communication skills:

SYSTEMS PROGRAMMERS—We have expansion openings for MVS, IMS, CICS and TPNS systems programmers. Besides a strong systems programming background in one of the above areas, successful candidates also need strong OS/JCL and utilities, SMP and appropriate debugging skills along with work experience in a large scale MVS environment.

SR. TELECOMMUNICATIONS ANALYST—Provide advanced analytical support on small to large scale voice telecommunications projects. Perform complex technical and financial analyses of telecommunication products/services recommending best product to users.

SUPERVISOR, INTERACTIVE SYSTEMS—Supervise a group of systems programmers with responsibility for installation, maintenance and problem resolution for interrelated products within Interactive Systems (e.g., CICS/DL1, DB2, ISC). Is responsible for planning, organizing and directing the group.

DATA COMMUNICATIONS TECHNICIAN SPECIALISTS—Coordinate installation of data communications equipment and facilities and utilize diagnostic tools for troubleshooting complex network problems. Substantial experience required, along with strong technical knowledge of data communications hardware/software.

Put your advancement on line with a company dedicated to the highest standards of performance. We provide an excellent compensation and benefits package as well as relocation assistance. Explore your growth options by contacting us:

DATA PROCESSING

Beautiful. Technology.

That's what we offer at Bear Creek Corporation in Southern Oregon. You'll work with advanced applications technology in beautiful surroundings, away from big city congestion.

We're a growing, quality-oriented company which markets fine mail order products (fresh-fruit, gourmet-food gifts, roses and garden products) directly to the consumer through two principal subsidiaries, Harry and David, and Jackson & Perkins Co. We're located in Medford, Oregon, a town which is still small enough that the trees outnumber the people in an area offering excellent skiing, hiking, fishing, sailing and swimming.

Currently, we're looking for:

PROGRAMMER ANALYSTS

You'll design and program computer systems and will be involved with gathering specifications, coding, testing and installing systems to user's satisfaction. 2 years' experience programming IBM 360/370 computers in ALC and working with IBM MVS operating system. JCL and utilities is required. You must also have excellent communication skills.

CICS SYSTEMS PROGRAMMER

You'll provide technical software support to applications programmers, users and operations and will evaluate new software. 3 years' experience with CICS assembler language programming, CICS data communications and excellent communication skills are required. IMS, DATACOMM or other DBMS experience desired.

TECHNICAL WRITER

You'll write and edit various applications documentation and other supporting materials for user, operations and programmers. 2 years' experience in technical writing specifically for large mainframe computer systems required. Other requirements include experience with popular IBM PC word processing software and excellent communication skills.

SYSTEMS ANALYST

Your primary duty will be translating user requirements into specifications for computer-based information systems. You must have two years' experience in systems analysis in a large organization using mainframe computers. Excellent communication skills are also required. A programming background would be helpful.

MANUFACTURING PROGRAMMER ANALYSTS

Responsibilities include programming and maintaining computer systems for manufacturing. To qualify, you must have knowledge of concepts associated with materials requirements planning, inventory accounting, work-in-process, purchasing, accounts payable and quality control systems. A proficiency in structured IBM/AMS COBOL is also required.

Bear Creek Corporation, a subsidiary of R.J. Reynolds, offers competitive salaries, excellent benefits and fully-paid relocation assistance. Please send your resume with cover letter and salary requirements to: VP Human Resources, P.O. Box 299, Medford, OR 97501. EOE.

BEAR CREEK CORPORATION

---

*P*olo, Lauren, Tuxedo, Chaps, Monogram ... Vanderbilt ... and Paloma Picasso, they're the scents that are on everybody's lips. As a result of the creativity and talent of our people, these products have made us one of the fastest growing companies in the cosmetic/fragrance industry.

Programmer/ Analyst

Right now, we're looking for a Programmer/Analyst who can handle the following responsibilities: defining requirements for improving or replacing systems, ensuring cost effectiveness of recommendations, guiding systems development, developing programs, documenting current systems operations, performing interviews and other data gathering, and much more. At least 4 years' DP experience is required, along with training in systems analysis and design with an emphasis on strong technical skills, plus efficiency in the following languages: COBOL, CICS, IMS, OS and MVS.

If your record in these areas is as impressive as ours in cosmetics, we will offer you an excellent salary, benefits to match, and plenty of room for career growth. To apply, please send your resume, with salary history and requirements, to: Human Resources Department, Warner Cosmetics, A Division of Cosmair, Inc., Dept. RFCW 610, 690 Cottontail Lane, Somerset, New Jersey 08873. We are an equal opportunity employer.

WARNER COSMETICS

A Division of Cosmair Inc.

EDP AUDITOR

NO TRAVEL REQUIRED

A data center seeks an experienced EDP Auditor with large IBM mainframe (MVS, CICS, TSO) experience to conduct EDP examinations and manage the EDP and non-EDP staff. A minimum of 3-4 years of EDP Audit experience required in addition to prior managerial responsibilities. Great Neck area. Send resume to: P.O. box 907, Great Neck, New York 11022.

Dynamic Control has made a commitment to lead in the development of advanced software for the healthcare industry. We're a division of Travenol Laboratories, a Fortune 500 NYSE company, and a recognized leader for both the development and installation of comprehensive software for the healthcare industry. Opportunities are currently available in Bethesda, Maryland, Orlando, Florida, Chicago, Illinois and our newest branch location in Glendale, California.

You'll work in a leading edge hardware environment; IBM System 38, and advance your programming experience in RPG II on the S/34, S/36, or RPG III on the System 38, in an interactive on-line environment. Positions are available in Systems Development, Customer Support, Client Services and Clinical Systems areas. In order to qualify, we ask for a minimum of 2-3 years experience.

Dynamic Control offers a nationally competitive salary structure, relocation assistance, a liberal benefits package, in-house technical training and every encouragement to advance professionally. For prompt consideration, call Julie Rea, Human Resources, TOLL FREE, at the number above, or submit your resume to: Human Resources Dept. CW0610, [illegible] Seminole Springs Dr., Longwood, FL [illegible]. An Equal Opportunity Employer M/F.

Salaried or Independent

Don't trust us to keep your classified information secret

Every week, we delivėr more of your target audience than anyone else. Over 600,000 computer-involved professionals. Including MIS/DP directors, systems analysts, programmers, and engineers – as well as corporate presidents, treasurers, and general managers.

And we deliver these readers for less. Compare costs and the people reached. You'll see that Computerworld is the number one medium for reaching MIS/DP professionals.

Our readers rely on Computerworld's classified section. In fact, 41% of our subscribers read the recruitment section every week. And 95% of our subscribers read this section regularly.

Readership like this means responses. Just ask some of the 4,000 organizations that ran more then 6,500 recruitment ads in Computerworld in 1984.

We make your ads work harder. Because we divide the classified section into logical categories: Position Announcements; Buy, Sell, Swap; Software For Sale; Time & Services; and The Bulletin Board. (Available on request: Software Wanted; Business Opportunities; and Real Estate).

So the people you want to reach will spend less time looking for your ad, and more time reading it.

We'll even typeset your ad at no extra charge. All you need to do is attach clean typewritten copy to your order. (Figure about 25 words per column inch, not including headlines). Or give us your order over the phone. We'll do the rest.

And since we're published weekly, we can offer you a fast turn-around from when you place your order to when your ad appears. As little as 10 days.

The next time you want results, advertise in Computerworld classified pages. Call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700. Call now.

THE
NATIONAL
COMPUTER
CONFERENCE

You've got 3 chances to take advantage of it with us— **the Preview issue** *(July 8th),* **the Show issue** *(July 15th) and the* **Wrap-Up issue** *(July 22nd).*

The NCC issues will have a readership over and above our usual 600,000+ readers. It's time to make one of your smartest advertising moves this year.

Give us your advertisement. We have the classification to cover it:

Position Announcements
Buy - Sell - Swap
Software for Sale
Software Wanted
Time & Services
Bids & Proposals
Auctions
Publications
Seminars
Business Opportunities
*** The Bulletin Board**

The open line rate is $10.35 per line and the minimum ad size is 2 column inches (1 column x 2" at a cost of $289.80). Send us camera-ready copy (*except for Bulletin Board) or copy to be typeset by us at no extra charge. Enclose any logos, artwork, or borders that you want to use in your ad. And if you are a first-time advertiser, please send payment along with your ad.

* Space in the Bulletin Board (used only for selling or buying pieces of equipment in a low-cost format) is bought in 1 column inch units ($140.00 each). The ad set-up usually consists of a headline, body copy, and a contact (name and/or number) – no logos or borders.

Send all materials to Classified Advertising, COMPUTERWORLD, 375 Cochituate Road, Box 880, Framingham, MA 01701.

MODEM SALE

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 126,000 this fall. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read. It offers classifications to solve a variety of problems:

Position Announcements,
Positions Wanted, Buy • Sell • Swap,
Software For Sale, Software Wanted,
Real Estate, Seminars & Conferences,
Publications, Bids & Proposals, Auctions,
Time & Services and The Bulletin Board

Our **BULLETIN BOARD** section is ideal for the smaller companies who want a low-cost way to sell pieces of equipment (hardware or software). The **BULLETIN BOARD** is laid out as a quick reference for potential buyers who know what they are after.

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

A number of special issues of COMPUTERWORLD are scheduled to run in 1985. Each of these issues will feature one aspect of the computer industry and give our advertisers a chance to reach a more select audience. These are some of the topics the issues will cover:

- June 24 - **DBMS**
- July 8 - **NCC Preview**
- July 15 - **NCC Show (closes July 3rd)**
- July 22 - **NCC Wrap-Up**
- August 26 - **Software Productivity Packages**
- September 30 - **Minis & Small Business Systems**
- October 28 - **Data Communications Terminals**
- November 25 - **Protecting The Corporate Information Resource**
- December 30, 1985 & January 6, 1986 - **Forecast '86**

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubset or camera-ready material (velox or negative) via the mail. We provide telecopier service and will also take ads over the phone.

Information concerning classified advertising rates, color costs, ad sizes, mechanical specifications along with more detailed information on the special issues is contained in the 1985 Rate Card #20 and Media Kit. Or from our offices.

IBM Value Added Remarketer

IBM 34/36

More than 8,000 companies use Para Research software systems to make their computer a more productive business tool. Quality and reliability have made Para Research software a standard among IBM users. It's proven in companies from the Fortune 500 to companies with 50 employees. It's backed by comprehensive documentation and responsive customer support.

Good program design and clear documentation make our systems user-friendly. No complicated procedures involved. With Para Research software you get quick response and timely and accurate reports to improve every area of your business. We also offer accounting software for the IBM System/38.

GENERAL LEDGER $3,500

A multi-company system for up to 99 companies and departments. Run different periods and different accounting years concurrently. Run each company in the GL independently. Create a unique chart of accounts for each company. Run different year-end closings. Print financial statements for each company. Design your own report formats. Out-of-balance and data entry errors are flagged to insure accuracy. Complete audit trails are provided. Allows for both fixed and variable recurring journal entries, accrual reversals can be automatically generated. Consolidates up to 49 companies into one. Strategic Ratio creates 30 different financial ratios to analyze assets, liabilities and equity.

ACCOUNTS PAYABLE $2,200

Handles every facet of accounts payable—from invoicing through issuance of checks. Various management reports provide up-to-date information on all payables plus complete audit trails. Cash requirement reports help you set payment priorities and take advantage of cash discounts. Displays open-payables for each vendor on your CRT. Allows you to take a discount amount after discount date, select a single batch of vouchers for updating to open payables file, and report status of every vendor on a vendor analysis report. Multiple line distribution for up to 19 accounts. System flags vouchers for payment.

PAYROLL $3,000

Payroll provides up-to-date costs of specific tasks for every department in your company. Employee master files for salary, hours and other payroll items are easy to maintain. User-friendly prompts provide the customer with complete instructions for each procedure. Up to nine deduction types for each employee. Multiple payroll data reports including check register, W2 forms, QTD 941s and 10 other reports. Runs payroll for 99 companies and for any combination of companies. Provides void check register. Stores YTD and QTD data.

FIXED ASSETS $2,500

A complete depreciation scheduling program that produces two-year projections. Figures depreciation over user-specified fiscal periods based on either the 1982 Economic Recovery Act using the Accelerated Cost Recovery System, the 1983 Reduced Basis ACRS or twelve other standard depreciation methods. Separate depreciation for federal tax, state tax and book. A series of management reports track depreciation schedules, report changes in those schedules, give projections over a two-year period. Complete tracking of assets including identification labels.

ACCOUNTS RECEIVABLE $2,500

Improves bookkeeping efficiency and reduces administrative tasks. Available in either open item or balance forward methods. For both methods, the system has cycle billing capability and allows printing of all statements on file or statements for specific customers. You can obtain up-to-date status of customer records, including current balance, all aging information and credit status checking.

It's about the biggest step forward you can take toward solving your business problems.

Move ahead with COMPUTERWORLD

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's
Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

MSA WE ADD THE GENIUS TO COMPUTERS.™

The Software Company

FINALLY.
THE TECHNOLOGY THAT OPENS THE DOOR TO BORDERLESS RETRIEVAL.
INFORMATION EXPERT™ FROM MSA.

Retrieval. ■ Until now, that meant manual. Because each different application system had different reporting. Which you had to learn. ■ But MSA has changed that forever. With Information Expert (I.E.). The mainframe software tool that lets you retrieve information from multiple systems in one step. At one time. Even if they aren't MSA systems. ■ I.E. is built around the data dictionary concept. So there's only one reporting facility to learn. ■ Then there's friendly, step-by-step reporting for the first-time user. Powerful, more than fourth-generation language and full-screen editing for the data processing professional. And more. ■ To find out, contact Robert Carpenter at (404) 239-2000. Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326. ■ One-step retrieval with Information Expert. It's advanced. It's simple. And it's here today. ■

MMA to seek publishers' support on site licensing

By Edward Warner
CW Staff

NEW YORK — The Microcomputer Managers Association today plans to call officially upon personal computer software publishers to provide corporate users with software site licenses. The MMA said these agreements could free the micro managers from concern about software piracy.

In a press conference at PC Expo, a personal computer trade show here, the MMA will define what it calls a "negotiated license agreement" as an "unbundled agreement negotiated individually between the vendor and the [user] company," according to MMA President Allan Gross. Such agreements are often called site licenses because they permit corporate software users to license a package for use on multiple personal computers within their firms.

The MMA, which includes members from 85 New York-area Fortune 1,000 firms, will propose that three types of software licenses be made available: volume purchase agreements; limited licenses, under which the user would be able to make a specified number of copies; and unlimited licenses, under which copying would not be restricted.

Gross, a personal computer manager with an investment banking firm, said one of the micro managers' goals is to eliminate the software retailer from corporate software buying, leaving only direct vendor sales. Referring to what he called the lack of support that retailers give corporate users, Gross claimed, "We get very minimal service for such a chunk of the price [that we pay]."

In issuing a formal call for site licensing, Gross said, the MMA was also expressing frustration with the effort required to

Uccel tools integrated under MVS

By John Gallant
CW Staff

DALLAS — Uccel Corp.'s Systems Software Division last week harvested the first fruits of a strategic development push aimed at tying together its complete line of systems software packages for IBM MVS shops. The product introductions came one day after rival Computer Associates International, Inc. announced the integration of its MVS systems software into a single product offering [CW, June 10].

Announced to more than 1,300 users at the company's Systems Software Conference users group meeting here, Uccel's Synova series is aimed at helping users integrate Uccel systems products and in-house-developed data center management tools through common logon, communications and command facilities. A spokesman said that when it is completed, the Synova series — whose name is a hybrid of the terms synergy and innovation — will consist of four tiers of products.

The first level is a generalized logon/logoff facility, which Uccel unveiled last week in the form of its Nova:Log package, that allows for common access to all the company's systems packages. The second is a common command language for use across Uccel's product line. The third level is a standard communications facility for data exchange across the firm's product line.

The remaining level consists of what the spokesman labeled "high-level components" handling specific data center man-

Demand low for smart buildings

By John Dix
CW Staff

WELLESLEY, Mass. — Building developers are rushing to construct smart buildings, despite a lack of user demand and their own belief that services will not attract tenants, according to a study conducted by Telematics Resource Group, a market consultancy here.

Intelligent buildings typically enable tenants to share telephone switches, long-distance telecommunications services and computers. They may also provide for shared use of security, climate and lighting control systems.

According to Telematics, roughly 60% of building developers are currently considering, planning or implementing so-called shared tenant services, although these services are still part of a fledgling industry. "The majority of developers are planning to implement these services while admitting it won't do anything for them," according to Telematics President Marc Rudov.

Telematics contacted 55 real estate developers and asked them, among other things, where they thought tenants would rank shared services on a list of demanded features. "[More than] 90% of the firms ranked shared tenant services on the bottom of the list," Rudov said, behind concerns like price of the lease, building location, free parking and proximity to modern conveniences.

"Developers told me that even though they were installing shared tenant services, they did not believe they would gain new tenants by doing so," Rudov said. "Most of the developers considered the services an amenity."

Prospective tenants are also lukewarm toward shared services.

Of the 245 users who responded to Telematics' mail survey, 70% said they

Akers predicts IBM profit dip

By Peter Bartolik
CW Staff

YORKTOWN HEIGHTS, N.Y. — IBM President and Chief Executive Officer John F. Akers said last week the company now expects profits for the first nine months of this year to be less than profits for the first three quarters of 1984.

Akers' comments to securities analysts here last Wednesday included a downward revision of earlier projections and sent IBM stock plummeting by more than $5 per share in two hours of trading on Wall Street the same day. Earlier, the company said it expected second-quarter profits to be down slightly from the year-earlier period but that it expects the second half of the year to produce solid growth for the fiscal year.

Akers said customers are still carefully evaluating the announced 3090 mainframe products and that intermediate-size systems shipments are below expectations; Personal Computer product shipments will continue to increase for the remainder of the year but not at "the torrid pace of last year," he noted. Akers added that the company had moved up the general availability of the 3090 Model 200 from November to early October.

Charles Greco, a vice-president with Framingham, Mass.-based International Data Corp., said a recent survey of 816 sites using 3080 series machines revealed that more than 370 of the Model 200s will be installed this year, with more than 300 of those installations coming in the fourth quarter. During the next 18 months, he said, those 816 sites will accept 1,055 of the new mainframes.

IBM now projects that the rate of all shipments this year will increase by 20% over last year, Akers said, compared with earlier projections of a 30% increase. He said IBM still expects total revenue this year of more than $50 billion, up from $45.9 billion in 1984.

In the first three quarters of 1984, IBM had profits of $4.4 billion. In the first quarter of this year, the company posted profits of $986 million.

Akers said economic growth in the U.S. is "in a lull," primarily owing to massive increases in imports. "The combination of high imports and [an] unprecedented upsurge of capital spending [in recent years] has caused customers to pause [and] reassess the pace of their individual company growth and investments," Akers asserted. "It therefore has had a direct impact on our industry."

Regarding earlier projections, Akers said he had also qualified previous comments with the observation that an economic downturn would have an impact on IBM.

"That slowdown has come, and achieving the solid growth we expected then for 1985 is now unlikely," he said.

Visicalc, 5, was top spreadsheet

By Edward Warner
CW Staff

A chief catalyst of the boom in corporate personal computing died last week at the age of 5.

Announcement of the passing of Visicalc, the first popular electronic spreadsheet, was low key: a paragraph in a press release from Lotus Development Corp., Visicalc's new owner. Lotus said it would discontinue the product but would support users for two years.

For some of those who remembered Visicalc, though, its passing was regarded with a touch of regret. The spreadsheet, introduced for the Apple Computer, Inc. Apple II in late 1979, sold 600,000 copies in its lifetime and was said to have been the first to make business aware of the power of personal computing.

It was foremost, according to one user, "an easy product to use." That user, Norm Dewitt, director of the Personal Computer Industry Service at San Jose, Calif.-based market research firm Dataquest, Inc., said that when he first encountered Visicalc in 1982 — as an employee of IBM's Personal Computer Group — Visicalc was the only spreadsheet for the IBM Personal Computer.

Other users, though, had no love for Visicalc. Though he mourns the loss of the magic of the Visicalc name, senior analyst Chris Christiansen at the Yankee Group said he "never liked [Visicalc] very much, especially after [Lotus'] 1-2-3 came out."

Visicalc had been ailing ever since the introduction of 1-2-3, largely due to its failure to match the improvements in the Lotus product, Dewitt observed. Lotus' 1-2-3, for example, offers menus that spell out functions; Visicalc used letters to symbolize its commands, and "you had to know what each one of those letters meant," Dewitt noted.

To worsen its troubles, Visicalc's developer, Software Arts, Inc. of Wellesley, Mass., became embroiled in a legal dispute with Visicorp, the firm that marketed Visicalc. Software Arts eventually won rights to Visicalc but was weakened by the battle. The firm was acquired by Lotus in April.

In what may be a token of memoriam, Lotus said it will offer users of the IBM Personal Computer version of Visicalc the opportunity to upgrade to 1-2-3 for $250.

MAN'S PRODUCTIVITY HAS ALWAYS BEEN LIMITED BY THE LANGUAGE HE USES.

"Do you spell that with a bird or a tree?"

And no one knows it better than a programmer.

With this in mind, we at ADR® realize the best way to make programmers more productive is to provide them with more efficient programming languages.

ADR/IDEAL® our 4th generation application development system, automates programming, so it makes the computer help programmers be more productive.

ADR/IDEAL applies a 4th generation language to all phases of an application's life cycle, which makes the entire programming process more productive.

And ADR/IDEAL's easy to understand language lets non-programmers develop their own applications. And that gives programmers more time to be more productive.

ADR/IDEAL is complete enough to be the only true replacement for COBOL. But since most of your applications are COBOL-based, you just can't abandon COBOL. So we won't. In fact, ADR is the only software company that offers an enhanced COBOL language as well as a 4th generation language.

ADR/DL™ our high-level extension of COBOL, significantly reduces the amount of coding and maintenance necessary, which makes programmers more productive.

ADR/DL brings the active dictionary support and the powerful data manipulation language of a relational software system to the COBOL environment. Which also helps programmers be more productive.

ADR/DL can produce whole sections of COBOL code with a single command. And that certainly makes programmers more productive.

Both ADR/DL and ADR/IDEAL use intelligent editors to generate bug-free code. So, with an ADR programming language, programmers work faster and better.

Man's productivity may indeed be limited by the language he uses. But by significantly reducing the time it takes to create and maintain an application, ADR programming languages are helping productivity reach new heights.

For more about ADR programming languages, mail us the coupon. Or call 1-800-ADR-WARE and discover that, at ADR, increasing productivity is more than just talk. It's language.

Wangnet users exploring net's broadband applications

By Paul Korzeniowski
CW Staff

Many customers of Wang Laboratories, Inc.'s Wangnet purchased the product to solve one specific problem, and only recently have they begun to explore other applications available on the broadband local-area network.

The capacity of Wangnet is divided into five bands, each of which has a different function: the Wang Band permits communications between Wang systems at speeds up to 10M bit/sec.; the Peripheral Band connects Wang workstations and peripherals to IBM 3270 series devices; the Interconnect Band can be used to support multiple types of devices working with standard protocols; the Utility Band supplies video applications; the Professional Computer Service connects Wang Professional Computers to the network.

In 1983, Ethicon, Inc., in Somerville, N.J., attempted to determine how to add 50 terminals to its five Wang minicomputers. Rather than purchase additional systems, the company decided to install Wangnet. This enabled the company to use its existing hardware to support the additional terminals efficiently.

"If we hadn't purchased Wangnet, we would now have seven or eight minicomputers," noted Robert A. Richard, lead communications analyst at Ethicon. "Also, the network helped to reduce cable costs through our two-story complex." Another benefit is that document and file transfers are supported on the Wang Band.

While connecting Wang devices over the Wang Band was relatively simple, using the Peripheral Band to connect Wang users to Ethicon's IBM 3081 Model K mainframe has proven to be difficult. "For a month, we tried to attach a modem to the network, but it never worked," Richards said. Wang sells its Cmux DS270 modem that can be used to attach an IBM 3270 communications controller to the network's Peripheral Band.

Problems arose because the Cmux DS270 did not support Ethicon's IBM 3274 Model D controller. "I've been told that other controller models run fine," Richards stated. Ethicon expects a model of the modem to arrive in two weeks and plans to field test the unit.

The University of Wisconsin was one of the early users of Wangnet [CW, May 16, 1983]. Today, the network supports 47 Wang Office Information Systems, seven VS minicomputers, 1,200 Wang terminals and 500 other terminals on the network.

Rather than connecting IBM mainframes to Wangnet through the Peripheral Band, the University connected them through fixed-frequency channels on the Interconnect Band. Thomas Scott, manager of data communications, reported no problems attaching the users to the mainframe.

Scott is very satisfied with the network but listed a few problems. "It would be helpful if there was compatible system software across Wang's product line," he said. "Often, the microcode for some of the systems is incompatible."

Scott is not satisfied with Wang Band's transmission speed. "I don't think it works at a speed of 10M bit/sec.," he said. Also, he would like to allocate ports dynamically. Devices on some bands have to be assigned to specific ports. "We could have more users on the system if we could dynamically allocate ports," he explained.

General Foods Corp. in Rye Brook, N.Y., was most interested in Wangnet's videoconferencing capability. When the company constructed a new building in 1982, it wanted to include network wiring in the building plans. "It was a perfect time for us to lay the wires down," noted Michael Greco, manager of office systems at General Foods.

Greco stated that a baseband network would not have enough bandwidth to support a video system. "Also, we couldn't wait for a product that was being developed," he added. "Wangnet was really the only product that was available when we needed it."

Today, General Foods works with seven television channels on the Utility Band. There are 28 conference rooms and a television studio attached to the video network.

Greco concluded, "We bought the system for its video capability. Any other applications it provides [are] a bonus."

Wang reaping benefits of unclear IBM net strategy

By Paul Korzeniowski
CW Staff

Wang Laboratories, Inc. appears to be a primary beneficiary of IBM's unclear network strategy.

"IBM and AT&T are touting network schemes that may be the dominant future architecture," stated Mark Stahlman, an analyst at Sanford C. Bernstein Co., a New York investment firm. "But if a company wanted a comprehensive network today, it would probably require a broadband network. Who would a company turn to? [Sytek, Inc.? Ungermann-Bass, Inc.]? Probably not." Stahlman predicted that a company would probably have some Wang equipment and a relationship with that vendor, so it would be inclined to purchase Wangnet.

Wangnet, announced in 1981 with first shipments in 1982, created a great deal of interest. "There was a lot of hype about the product because it was billed as a cure-all," Stahlman noted. "That has not turned out to be the case."

When it was announced, Wangnet was perceived as an alternative to baseband Ethernet networks. Wang and Ethernet proponents debated the virtues and vices of the two network approaches. "The broadband vs. baseband debate has been settled," noted William Rosenberger, director of strategic planning at the Yankee Group, a Boston market research firm.

"Companies realize that both approaches are suitable for specific applications. If there is a large installation base that has to be tied together, then broadband is appropriate. However, broadband will cost more than baseband," Rosenberger said.

Rosenberger added, "There are probably more Ethernet networks sold, but there are more terminals on Wangnet. The Wangnet customers tend to have elaborate networks with a large number of terminals." Wang estimated that there have been between 300 and 400 Wangnets and an equal number of Fastlans, a scaled-down version of Wangnet, sold.

Despite the impressive number of installations, analysts listed some product shortcomings. "The network works well for Wang-to-Wang connections, and it makes sense for a company with a large number of VS or OIS systems to install Wangnet." said Kim Myhre, director of communications industry research at International Data Corp., a Framingham, Mass.-based market research firm.

"However, most large companies have substantial investments in IBM. It was only recently that Wang opened the network up so it supports capabilities in addition to simple IBM 3270 [series] terminal emulation."

Recently, Wang announced gateways to IBM's Systems Network Architecture, Distributed Office Support System and Professional Office System. The company may also add support for IBM PC Network and for a maximum of five Ethernets to the network, according to a company spokesman. The spokesman stated that only 65M bit/sec. of the product's 390M bit/sec. bandwidth are currently utilized.

Another drawback cited by analysts was Wangnet's high cost. "Wang products traditionally have been high priced," said Linda O'Keeffe, associate director of office system industry service at Dataquest, Inc., a San Jose, Calif. market research firm. "If Wang would drop the price of Wangnet, it would sell much better."

IDC's Myhre added that the introduction of Fastlan helped to spur sales of the product. "Companies would rather look at the product in a controlled way, rather than installing a complete system," he noted. Initially, Wangnet was the victim of a number of delays and product snafus. "Some early adapters had to wait to receive the product, and sometimes the parts didn't work."

How would IBM's announcement of its token-ring local-area network and evolution of its cabling plan affect Wangnet? O'Keeffe predicted, "Wang will incorporate the IBM network into Wangnet and attempt to offer superior network management facilities to stay a step ahead of its competitors."

O'Keeffe concluded, "This year represents a watershed year for local-area networks. Wang should be able to profit from an increase in these sales."

Sortland Yard warns against "Rafflles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

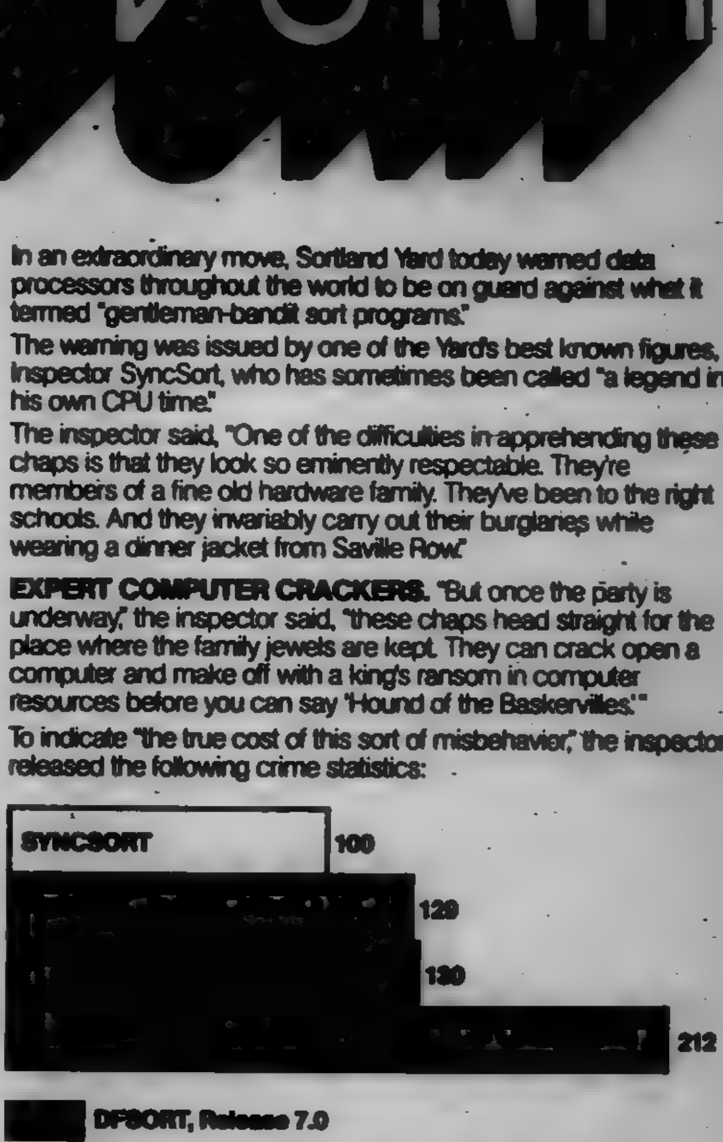
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied. "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

Homegrown benchmarks key to system purchase

By [illegible]
CW Staff

PROVIDENCE, R.I. — Faced with the need for a system, the American Mathematical Society here designed and conducted benchmark tests pitting a machine from IBM against one from Digital Equipment Corp.

After reviewing test results, the society chose a DEC 8600-based computer system to meet its needs for the next five years. According to Samuel Whidden, director of computer services, the society developed benchmark tests from its applications for several machines, including an IBM 4381 Model 2 mainframe computer. The society runs mostly Cobol business applications and performs scientific typesetting functions, Whidden said.

The benchmarks consisted of having the machines run a version of the society's typesetting software, Cobol and Fortran compiles and one of the society's Cobol applications.

The society's search — originally encompassing eight vendors' systems — narrowed to the three following possibilities:

- A DEC 8600-based system that called for two 8600s, one to be delivered by December 1985 — with a DEC VAX-11/785 serving as a temporary fill-in until then — and the second one to be delivered in 1987.
- An IBM plan that contained an initial 4381 Model 1, to be upgraded in two years to a 4381 Model 2 and upgraded again in 1989 to a 4381 Model 3.
- An IBM option that called for a 4381 Model 1 that would be upgraded to a 4381 Model 2 in 1987 with no further upgrades.

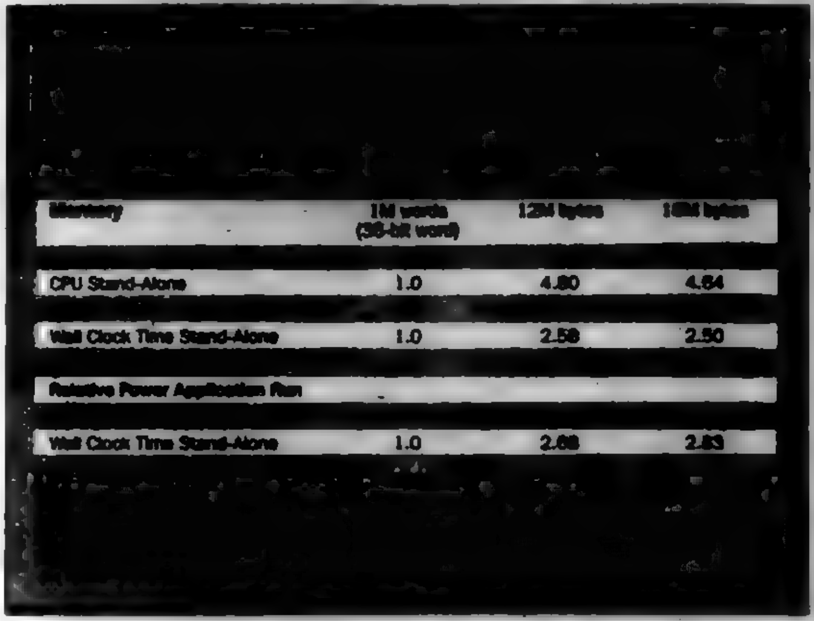
A stand-alone VAX 8600 with a floating-point processor that ran the society's benchmark tests was 4.8 times more powerful than the society's present DEC Decsystem-2060 running the vendor's Tops-20 operating system, the planning committee's final report stated. The IBM 4381 Model 2 was 4.64 times more powerful when the machines were compared in a stand-alone mode, that is, running one test at a time, according to the society's "Planning Group Report on Computer Systems Evaluation."

When loaded with several jobs in batch mode or several users in interactive mode, the DEC 8600 tested at 5.11 times more powerful than the Decsystem-2060 and the 4381 Model 2 showed that it was 4.73 times more powerful.

DEC provided Fortran Whetstone and Cobol U.S. Steel benchmarks as well, the report stated, but IBM did not include such tests for its system. "There is a lot that [benchmark tests] lack," Whidden said. "They may not be relevant to anyone else, and may not forecast well for us, but they are all we could devise to work for us."

Overall ratings (see chart above), which were calculated from the typesetting run and the Cobol application run, weighted 12:1 in favor of the application to give an accurate reflection of the society's current Cobol/typesetting load mix.

IBM was unwilling to run the benchmark tests on a 4381 Model 3 configuration, which is a tightly coupled pair of 4381 Model 2 machines, Whidden said, because the company felt the results would not be valid. The vendor said — and the society accepted as true — that a Model 3 would provide 1.7 times the performance of the Model 2, he said.



Memory	1M words (36-bit word)	12M bytes	16M bytes
CPU Stand-Alone	1.0	4.80	4.64
Wall Clock Time Stand-Alone	1.0	2.58	2.50
Relative Power Application Run			
Wall Clock Time Stand-Alone	1.0	2.68	2.83

IBM machine not as fast as 8600

The IBM system would not run as fast as the 8600 configuration, the report said. The planning group also found the IBM machine more difficult to use because of the complexity of the VM operating system.

The society's benchmark tests did not confirm the planning committee's expectation that the IBM 4381's throughput would be superior.

The stand-alone 8600 showed a 94% proportion of CPU time to real time when running the typesetting program as opposed to the 4381 Model 2's 89%, the report said. When running the same program loaded, the machines showed 58% and 49% proportions, respectively, it said.

The IBM machine showed a better throughput time in the loaded application run test, with 16% proportion; better than the 8600's 12% proportion, the report showed. In stand-alone mode running the application program test, the 8600 achieved 26% efficiency over the IBM machine's 22% proportion.

As part of the benchmark, the vendors had to do whatever conversion work was necessary to get the benchmark programs running on their hardware, the report said. The machines that were tested were configured similarly to those the society would buy, the report said.

Tandem pledges long-term network standards support

By Jeffry Beeler
CW West Coast Bureau

CUPERTINO, Calif. — In addition to introducing five software packages that promote the interchange of documents within its own network [CW June 10], Tandem Computers, Inc. recently disclosed its long-term intention to support a broad assortment of communications standards.

On the local network side, the company promised to support the IEEE 802.3 standard, which would permit Tandem networks to be interconnected with Ethernet-type networks. On the gateway side, the firm promised support of IBM LU6.2 protocol, which would enable Tandem mainframes to link to IBM hosts running IBM's Distributed Office Support System and X.400, the interface for hooking systems into public electronic message nets recommended by the Consultative Committee on International Telephony and Telegraphy.

Tandem also announced the start of internal projects to develop support for IBM's Document Content Architecture and Document Interchange Architecture, which translate the format differences between dissimilar word processors and thus enable them to exchange information.

In addition, the company disclosed a recent agreement that makes it a licensee for AT&T's Digital Multiplexed Interface standard, which enables host processors to be connected to private branch exchanges.

Tandem also announced it had signed licensing agreements with Sytek, Inc., a Mountain View, Calif.-based supplier of broadband local networks. One of the agreements calls for Tandem to support Sytek's protocols for IBM's Personal Computer Network, providing for interconnection of IBM micros with Tandem's mainframes or workstations. Another accord will result in Tandem's support of Sytek's open-architecture LocalNet product line.

About half the planned communications support will be made available by the summer of 1986, with the rest slated for readiness sometime within the following year, according to Kathryn Weiner, a Tandem product management director. However, Weiner declined to reveal any additional details about the firm's expected delivery timetable.

Announcement of Tandem's planned communications support coincided with the christening of the company's Information Management Technology (IMT) strategy, which calls for the use of the vendor's existing facilities to interconnect various incompatible machines and nets.

With the recent introduction of five electronic mail and filing programs, Tandem has already accomplished part of its objective by permitting information to be exchanged among selected multivendor terminals and micros. At present, however, the interconnection scheme applies only to devices that are connected directly to a Tandem net.

The next logical step in the evolution of IMT will be to widen the interconnectivity to ensure that information can be transmitted, not just between users in the same network type but also between different, incompatible networks. Here is where Tandem's plans for supporting a broad range of communications standards enter the picture, according to a company source.

Once support of the 802.3 standard becomes available, for example, a user whose device connects directly to a Tandem network will be able to communicate transparently with someone in an Ethernet or Starnet scheme, Weiner said.

Uptime

Provide 24 hour CICS access
CICS Dynamic File Allocation is a must for effective CICS scheduling. It is the gateway to non-stop, round-the-clock CICS systems. It eliminates batch update constraints. It guarantees bullet proof restarts. It allows you and your batch jobs to add and remove CICS files at will, without disrupting your user community. Site license $4,000.

Browse CICS dumps on-line
The CICS Dump Display Facility provides immediate access to CICS dumps. CDDF is a no overhead "monitor" for production failures and test system abends. Selective dumps are completely formatted for CRTs and, the dumps can be printed immediately. Site license $3,000.

Add-on unit solves firm's need for voice/data support

[illegible]

There is more than one way to skin a cat. Some users are finding it makes economic sense to add hardware to existing analog voice switches to obtain data support rather than buying a digital switch.

Gould AMI Semiconductors, a Santa Clara, Calif.-based division of Gould, Inc., did just that. After serving as the beta test site for the first product from Sunnyvale, Calif., start-up David Systems, Inc., the semiconductor development firm purchased the Information Manager.

The Information Manager is a device about the size of a two-drawer file cabinet that can be used to provide integrated voice/data support over twisted-pair wire when used with analog private branch exchanges or Centrex services.

Gould AMI is using the Information Manager with its AT&T Dimension 2000 PBX, installed in September 1981, according to Don Ohler, department manager of communications. The David Manager, the heart of the system, is located in a PBX wiring closet and is connected to the Dimension — which supports nearly 1,500 extensions — through a David Gateway over twisted-pair wire.

Roughly 120 of the Dimension users are supported through the David Manager. Of these, nine are voice-only users, 40 are voice/data and 70 are data-only users, Ohler said.

Voice-only users have David telephone sets that emulate AT&T 1A2 key systems, telephones that support multiple lines that are typically used by secretaries to monitor departmental phone groups. These sets provide multiline support over a single twisted-wire pair instead of the 25-pair cable that 1A2s typically require.

Voice/data and data-only users are supported with David Links that operate at 2M bit/sec. over a single twisted-pair wire. The capacity of a David Link is divided into four channels: a 1M bit/sec. packet-switched channel, a 64K bit/sec. channel for pulse-code-modulated digitized voice, a 64K bit/sec. circuit-switched channel for data and a 64K bit/sec. channel for signaling.

For its data-only connections, Gould AMI uses David interfaces called dual asynchronous device adapters. These adapters provide two RS-232C interfaces and are connected to the David Manager through existing twisted-pair PBX wire, Ohler said.

Voice/data connections are provided through David Links and David telephone sets. The sets digitize voice to be carried over the 64K bit/sec. pulse-code-modulated voice channel and provide Gould AMI with an RS-232C interface for terminal support. The David Manager converts the digitized voice signal into analog and routes the circuit to the Dimension PBX. The data channel is routed to the desired computer resource.

Gould AMI is using the circuit-switched data channel of the David Links to support asynchronous terminal devices, Ohler said.

The David Manager is installed in Gould AMI's design center. Gould AMI customers send system engineers to the center to design custom-integrated semiconductor circuits. The engineers, who have their own soundproof offices, own their workstation devices but can access Gould AMI computer resources through the David Information Manager, according to Barbara Kalkis, a Gould AMI spokeswoman. Engineers can switch between Gould AMI computers using the Information Manager and software bridges developed in-house.

> *The Information Manager is a device . . . that can provide integrated voice/data support over twisted-pair wire when used in conjunction with analog private branch exchanges or Centrex services.*

Ohler said the Information Manager system took roughly a week to install and that few problems have been experienced from the time the system was installed for beta test.

The company reportedly briefly considered installing a digital PBX instead of the David Systems equipment, Ohler said. However, at today's average cost per station, Ohler estimated it would have cost about $2 million to replace the company's Dimension 2000.

Ohler would not divulge the cost of the Information Manager, but David Systems claimed the system costs roughly $800 per port.

David Systems is located at 701 E. Evelyn Ave., Sunnyvale, Calif., 94086.

WHAT DOES THIS REPORT MEAN TO YOU?

Space occupied by data sets inactive for 30 days
Savings over full volume dump

This report means that ABR puts you in control of your system whether it drives 16 or [illegible] disks.

WITH ABR YOU:
- Identify and free-up inactive data sets
- Save by dumping only data sets which change
- Track and recall backups automatically
- Provide the security of current backups
- Install program in minutes with a simple linkedit

SEND FOR YOUR FREE DASD MANAGEMENT REPORT PROGRAM
(Contains tape and brief easy-to-follow guide.)

The only thing more convincing than seeing your own data produced in report form with such ease and accuracy is the factual measurement data you can provide to those whom you would influence and persuade.

ABR provides an efficient and easy-to-use method of managing the space on direct access volumes, regardless of the size of your system. And this report will help you prove it.

INNOVATION DATA PROCESSING
[illegible]

Adapso making progress on software protection device

By Paul Korzeniowski
CW Staff

The Association of Data Processing Service Organizations, Inc.'s (Adapso) Software Protection Committee is expected to announce within two months progress in its attempt to design a software authorization mechanism.

The Adapso mechanism consists of three parts: lock, key and key ring. The lock is code that is embedded in a program that prevents it from running. The key is a microprocessor stored on a key-like device that plugs into a key ring, opens the lock and allows a program to run. A key ring has a number of key slots and uses an RS-232 port to communicate with one or more programs.

The committee has made progress on the problem of how a key would fit into a key ring. The design is based on work by Apple Computer, Inc. engineers, a spokesman said.

"Adapso was searching for an inexpensive key, and the work at Apple helped to provide that," said Marv Goldschmitt, committee chairman and vice-president for business development at Lotus Development Corp., in Cambridge, Mass.

Apple's approach differs somewhat from the original Adapso design. The software protection committee was thinking of connecting a key to a ring through an eight-prong connector. Although this type of connector could have been used, it would have been expensive, Goldschmitt said.

The Apple design is based on a three-pronged connector much like the one used with a Sony Corp. Walkman. David Christensen, project engineer at Apple, estimated that the connection would cost $3 to $5, much less than the connector the committee was considering.

"Apple used a Walkman connector as an audio port for the Apple IIc," Christensen noted. "I don't think that any other computer manufacturer has used the connector for its products." He added that Apple has not yet chosen a connection and is considering other devices along with Sony's.

> *'Adapso was searching for an inexpensive key, and the work at Apple helped to provide that.'*
>
> — Marv Goldschmitt
> *Adapso committee chairman*

Apple had begun working on a software protection device before the Adapso committee was formed. "Apple wanted to help software companies develop a method of copy protection," Christensen said. "We were aware of the problems [that] some copy protection methods created for hard-disk system users."

A few months ago, Apple presented its work to the Adapso group. "We thought a number of manufacturers were addressing the problem of software protection," Goldschmitt said. "We were afraid that they would all build various models, and none would be compatible. The committee has helped to alleviate this problem."

Although the committee was impressed with Apple's design, it did recommend changes. "The committee thought that the Apple design limited the transmission speed from key to key ring," Goldschmitt said. "Although it would work fine with current products, it could create problems in the future. We also made other recommendations so it could support multiple-line protocols and data streams."

Christensen and Adapso committee members are modifying the design. "We should be left with one design that all manufacturers can work with," Goldschmitt said. He said he expects the modifications to be completed and placed in the public domain within two months.

Once the design is completed, vendors can manufacture software protection products. "There are a number of third-party companies interested in supplying software protection products," Christensen said. He expects these products could be available in the first quarter of 1986.

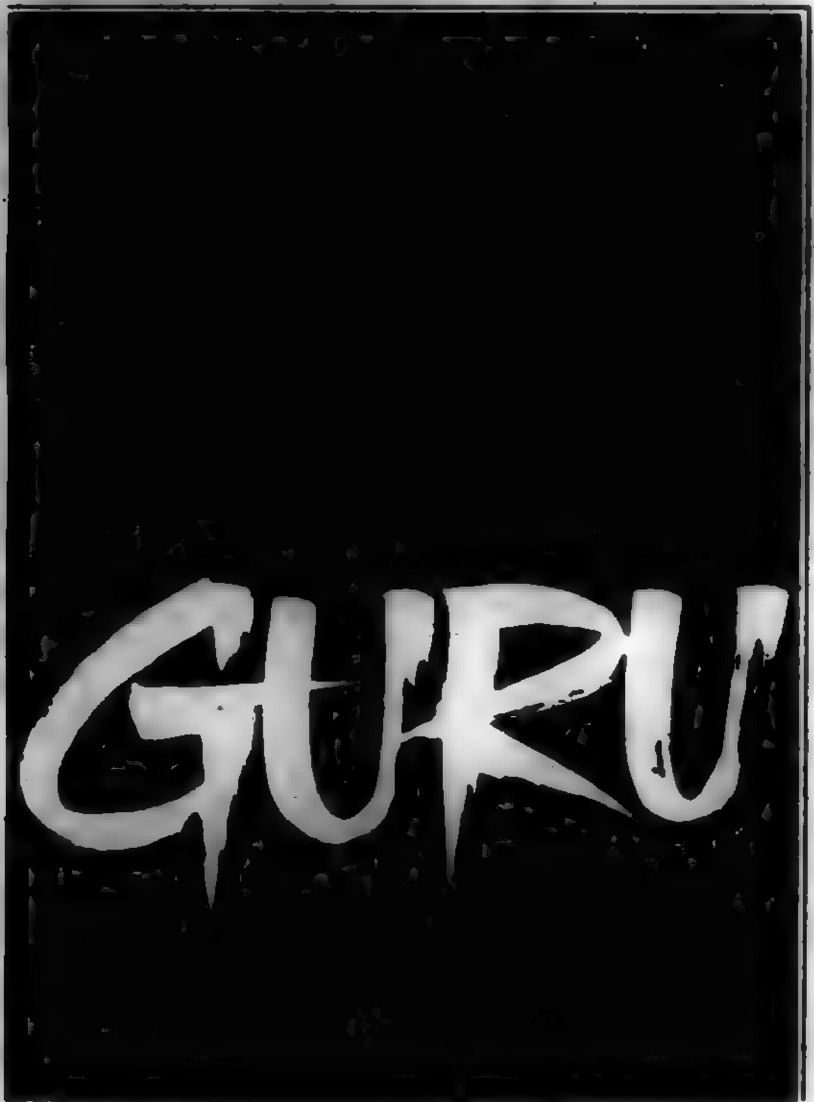
LICENSE

from page 1

police existing software licenses and the red tape that micro managers face when placing a software purchase order. The organization's proposal, Gross explained, is the result of a recent MMA poll in which members noted the items they felt would make up an ideal license. The following are items from the poll to be included in the position statement:

- The right to modify software for internal use, including serialization and the embedding of employee identification numbers. Such a feature would help MMA members keep track of software.
- The right to incorporate the vendor's software into a package that the firm is using internally.
- The right to receive regular notification of enhancements, service, product bugs and fixes. The membership, Gross said, was unanimous on that stipulation.
- The right to have source code held in escrow. This, Gross explained, would benefit users in case the vendor went bankrupt.
- The right to documentation updates for all users on site.
- An end-to-copy protection for software sold to corporations, which is another issue that Gross said had received complete support in the MMA poll.

The MMA decided to go public with the stipulations, Gross argued, because those are the points on which software vendors most often failed to act. Gross said he could point to no software vendor that performed adequately in all categories.



SIA files against Japan

WASHINGTON, D.C. — The Semiconductor Industry Association (SIA) last week charged that illegal barriers into the Japanese semiconductor market violate free trade rules, and the organization filed a complaint with the U.S. trade representative. The complaint charged that Japanese policies have continuously thwarted U.S. manufacturers in their efforts to penetrate the $8 billion Japanese market.

The SIA complaint, filed under the 1974 Trade Act (Section 301), gives the Reagan administration, and specifically the U.S. trade representative, 45 days to decide if the charges have merit and if a formal investigation should be initiated. The complaint said that for 10 years, U.S. semiconductor manufacturers have tried to penetrate the Japanese market and have failed. It also said that U.S. market share has never climbed to more than 10%.

The SIA asked the Reagan administration to negotiate immediately with the Japanese government to obtain "prompt and dramatic improvement in U.S. sales in Japan," as well as to take steps to "prevent current and potential Japanese dumping of semiconductors in the U.S. market."

The SIA complaint renews U.S. industry pressure on the Reagan administration to take concrete action against the Japanese and reflects continuing frustration over the failure to establish a foothold in the Japanese market. It comes at a time when the Japanese are capturing a large portion of the depressed U.S. market for high-technology products (see story page 12) and a large trade imbalance exists between the two countries.

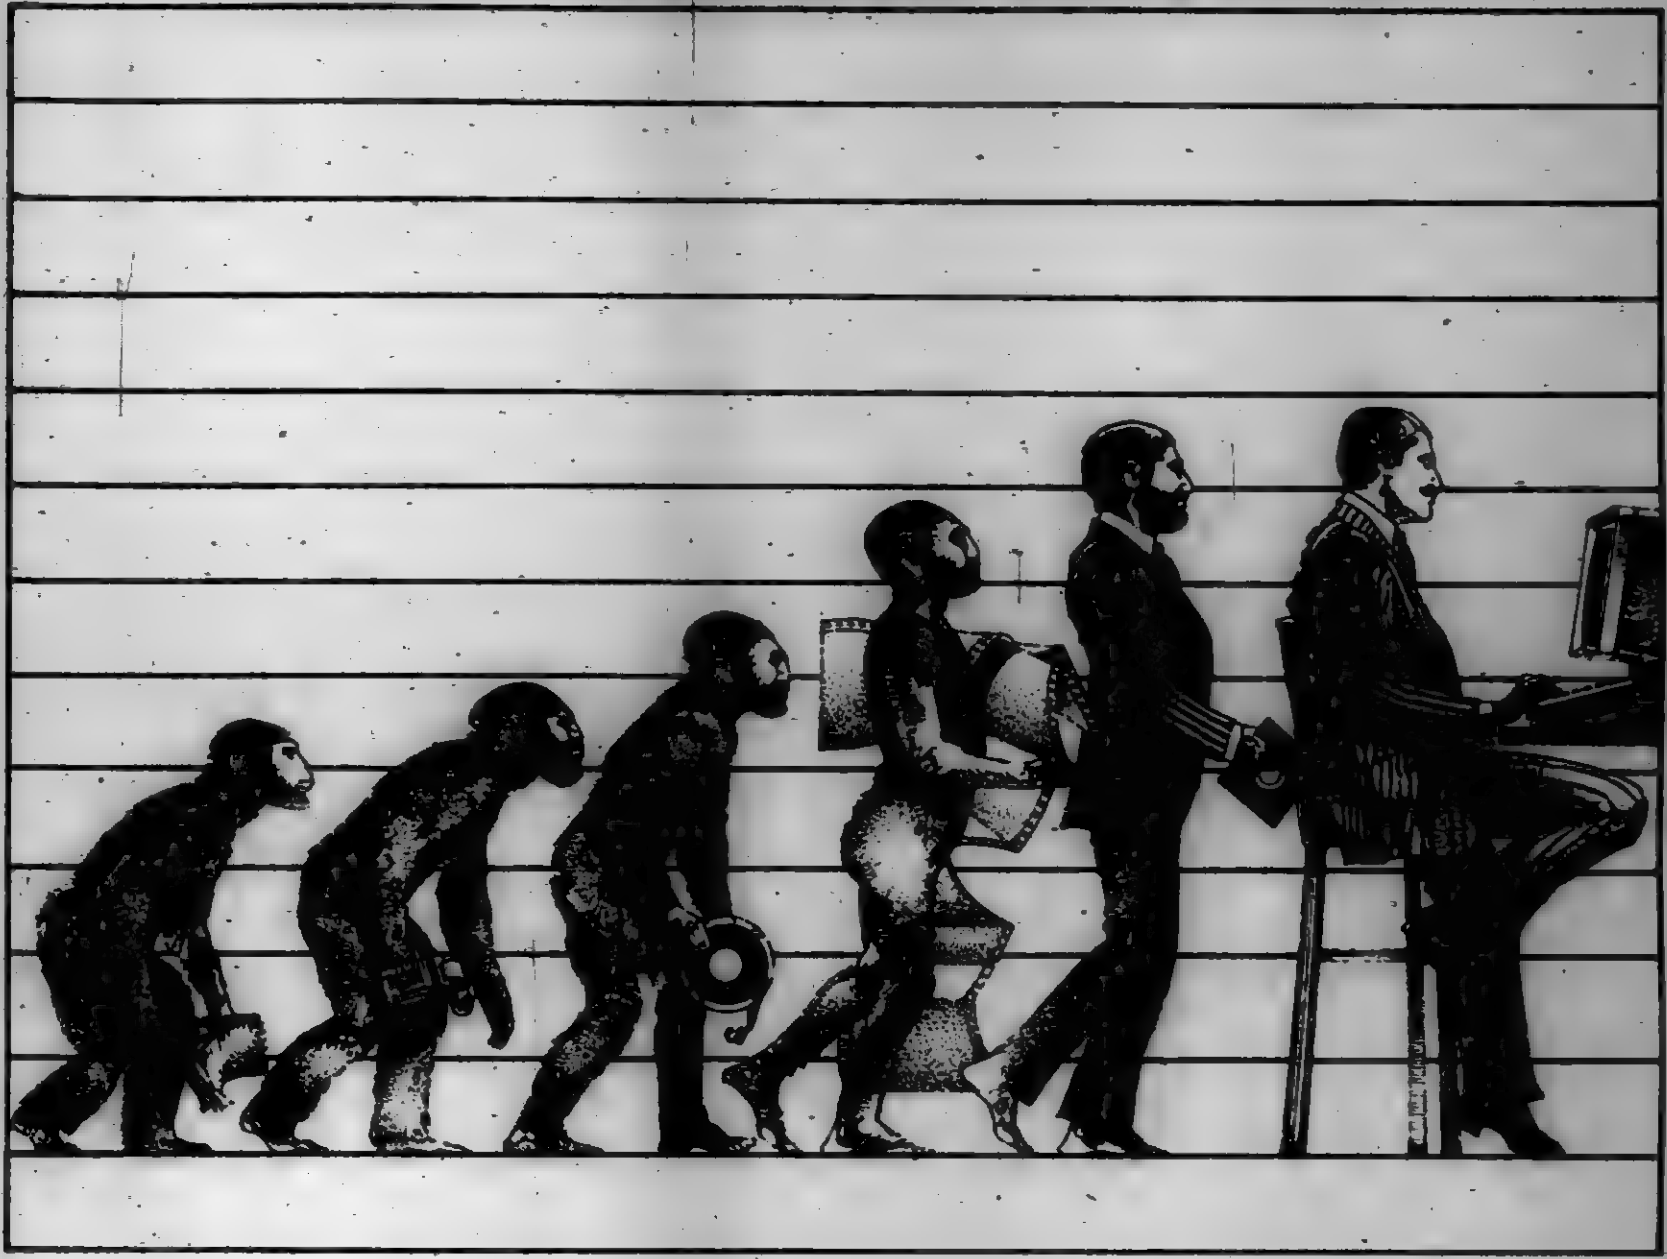
The SIA said the U.S. held a 54% market share worldwide in semiconductors, which accounted for $14 billion in sales in 1984. In Japan, U.S. market share was 11% and amounted to $960 million in sales, while the Japanese held an 89% share and had $7.1 billion in revenue. Worldwide, Japan accounts for 36% of the market, and its 1984 sales reached $9.9 billion, the SIA said.

SIA's charges describe the dominance of a few large Japanese semiconductor firms — NEC Corp., Fujitsu Ltd., Toshiba Ltd., Hitachi Ltd., Matsushita Electric Industrial Co. and Mitsubishi Electronics Corp. — in the market, and the organization accuses these companies of engaging in "Buy Japan" policies.

The SIA said that policies of the Japanese government have contributed to U.S. difficulties in making sales by encouraging protection of Japanese firms.

The SIA cited a recent internal memorandum of Hitachi's that urged its U.S. distributors to "quote 10% below competition. If they requote, bid 10% under again. The bidding stops when Hitachi wins," (see story page 91).

A HISTORY OF DECISION SUPPORT SOFTWARE



Comshare's System W goes beyond up-to-date.

A 1970's business modeling system with bolted-on data management capabilities is as up-to-date as a wax tablet and a stylus. And about as effective at lightening DP's workload.

Comshare has put $10 million and 18 years DSS experience into the extraordinary System W. And along with System W, we've also provided the software facilities you need to do a professional job of servicing your end-user needs.

For example:

With System W's integrated data management and File Power, you can set up data acquisition sequences including interfacing to corporate and external data in a variety of forms. File Power is the built-in response to the user's most often asked question, "How do I connect to the data?"

And with Distributed W, you have compatible micro DSS software with integrated telecommunication that sends files and models both ways asynchronously or synchronously. And System W operates on IBM mainframes with VM/CMS and MVS/TSO giving you flexibility as your operating system plans change.

Our Commander Learning Station gives end-users the latest in computer-based training on an IBM PC. Courses are available for System W as well as generic courses on how to model and use VM/CMS.

There's more. But System W is, simply, the best choice for decision support on IBM computers for excellent ease-of-use and integration. It's popular with end-users. Plus, it's easy to install, operate and interconnect with your DP architectures.

We started from scratch. System W is engineered to take full advantage of new technology. It's not an upgrade of an old product straining to keep up with the times. System W is as up-to-date as tomorrow.

For more information, call Chris Kelly at Comshare toll-free: 1-800-922-SYSW (in Michigan call: 313-994-4800). Or simply mail your business card to: Comshare, P.O. Box 1588, Ann Arbor, Michigan 48106.

SYSTEM W DECISION SUPPORT SOFTWARE

COMSHARE.

For decision makers who need to know their options now.

Smart buildings hold little or no interest for tenants

Tenants express little or no interest in shared tenant services, according to real estate brokers, but some service operators claim they have signed up most residents in their smart buildings.

"Shared tenant service is a buzzword more than anything else," said George H. Keller, a partner for Jones, Lang, Wootton, a real estate consulting operation in New York. "People aren't overwhelmingly inquisitive about it, but it is a topic of discussion."

In Boston, inquiries about shared services are not even on the list of questions prospective tenants ask about real estate, said Christopher Tosti, an agent with Leggat, McCall and Werner, a commercial/industrial real estate broker with offices in Boston and Washington, D.C. "They wouldn't think to ask about the services because they're not familiar with them."

Chicago is reportedly a major center for shared services. But Edward A. Laing, a senior associate with the real estate broker and development firm of Bennett and Kahnweiler, said, "I rarely have a request for that kind of facility. Tenants are primarily concerned with location, then price. Location is by far and away the No. 1 consideration."

Where there is a scarcity of office space, price can even outweigh the importance of location. "The big problem for your average tenant who is looking in the market in New York . . . is finding space he can afford," said Jeff Bernstein, an agent with Newmarket and Co., a brokerage firm in New York.

All of the brokers contacted agreed that shared tenant services were simply a building amenity and, by themselves, would do little to attract tenants.

Companies that operate shared tenant services for building developers concede this fact. "I don't know of anyone that has signed leases simply because of shared tenant services, but I know the services have served as a final kicker to bring people into a building," said Bob Dammeyer, executive vice-president of management with Lincom Corp. Lincom is a subsidiary of Lincoln Properties, the second largest real estate developer in the country, and operates shared tenant services in eight of its parent company's buildings.

Dammeyer claimed 86% of the tenants in those eight buildings are using the shared services after a year of operation.

Tenants share telephone switching systems and long-distance telecommunications services. Lincom does not offer computer services or energy management support.

A spokesman for Sharetech, a company in Parsippany, N.J., formed by United Technologies Corp. and AT&T Information Systems to market and provide shared tenant services, admitted, "There has been slowness on the part of tenants to catch on to the idea of shared services." Sharetech reportedly operates systems in 29 buildings and anticipates the addition of 30 more buildings by the end of the year. "I've heard it said that there is yet to be a tenant that will move into a building just because of shared tenant services," the spokesman said.

And while some tenants may inquire about shared services, there is no guarantee they will use them. "Some users look to see if a building may have these capabilities, but when they get into it, they realize it might be better to have their own switch and not rely on the landlord," said Keller of Jones, Lang, Wootton.

Idea must be marketed

Tosti of Leggat, McCall and Werner thinks that the market will have to be driven by developers. "I don't think you're going to find tenants suddenly wanting to move into smart buildings which developers then start building. I think developers will have to market the idea."

Developers themselves will shy away from actual involvement with the systems, preferring to bring in third parties like Sharetech, according to Keller.

"The business of most developers is bricks and mortar. If they feel they will have a better chance to sell or lease their space by putting in more embedded plant [such as equipment tenants can share], they will do so, but they will try to get an outside vendor to do it for them," he said.

— [illegible]

SMART

from page 1

would not use shared services if they were available in their building. The most frequently mentioned reason — cited 62% of the time — was that they already own equipment. Other reasons users cited were that shared services offer inadequate cost benefits (26%); alternative services that telephone companies offer are more appealing (21%); and shared service operators cannot match the reliability of the telephone company (15%).

While users and developers are equally tepid about shared services, they differ in how they would like these services provided.

There are three basic ways to offer shared services. With the in-house method, the developer buys and installs the necessary equipment and markets the service to tenants. Some developers prefer diluting their responsibility by entering joint ventures with independent service operators. Still others farm the task out to a third party that takes on the risk and expense of the venture.

"Most users would prefer shared tenant services to be provided by their landlords," Rudov said, whereas the developers Telematics contacted said they are leaning toward the concession or third-party approach. "The concessionary approach is the most popular with developers because it affords the least involvement, the least risk and the least money up front," Rudov said.

A financial albatross

The risk can be substantial. Developers willing to shell out the capital for the necessary equipment have no way of knowing how many tenants will subscribe to the service. If fewer tenants opt for the service than are needed to cost-justify it, developers cannot make up the difference by raising their prices because this would encourage other users to jump ship, Rudov explained. It is thus impossible to calculate whether the investment will become a financial albatross.

While economically safest, the third-party approach to shared tenant services does not mean smooth sailing for the landlord. "Even though the [service operator] doesn't usually have a formal relationship with the landlord, if he makes tenants angry, the landlord is responsible," Rudov said. Developers that Telematics contacted noted the risk of getting involved with a third-party operator who later goes out of business, leaving subscribing tenants high and dry.

"The biggest problem with this whole business is that vendors suffer from 'technologica erotica,' " Rudov said. "They assume that because the technology is there, the customers are going to turn cartwheels."

The Telematics study, called the U.S. Market for Shared Telecommunications Services in Multitenant Office Buildings, costs $3,950.

Telematics is located at 277 Linden St., Wellesley, Mass. 02181.

sive partner in a merger, as might be expected since the February announcement that its merger talks with ITT had been terminated, the union with Burroughs could mark the end of an era. Since 1951, the Univac product name has survived the merger of Remington Rand into Sperry Rand, Inc. in 1955 and the evolution to Sperry Corp. in 1979.

Analysts and users contacted by *Computerworld* expressed confusion about how the divergent product lines would eventually be merged. None of those contacted believed that any immediate steps will be taken to halt any product lines, and users said they hope the alliance produces a broader user base for the products of each company.

Although rumors of the discussions had surfaced earlier in the week, analysts and users reacted with surprise. "This is one [merger] that doesn't make a lot of sense," said Tom Linkas, an analyst with Goldman Sachs & Co. "The best both companies can hope for is to keep their installed base."

Dave Moschella, an analyst with IDC, noted the differing philosophies of the two companies. Sperry has actively sought a merger with other partners and was a major investor in Trilogy Ltd.'s effort to develop wafer-scale integrated semiconductors for a new generation of mainframes, he said. Burroughs, Moschella added, has been a "stalwart independent" that has resisted cooperative ventures, although it did acquire Memorex Corp. in 1982.

The two companies have established divergent strengths, Linkas said. Sperry is heavily involved in government contracts and, according to IDC figures, its share of the mainframe market has been slipping. Burroughs, however, has gained strength by revamping its high-end processor line in the past year, Moschella said.

AT A GLANCE

[illegible]

1984 revenue — $4.87 billion

Employees — 65,000

[illegible]

Large-scale 1984 shipments* and market share — 339; 9%

Stephen T. McClellan, author of *The Coming Computer Industry Shakeout* and a vice-president with Merrill Lynch, Pierce, Fenner & Smith, declined to comment on the specifics of the merger but said it was an example of the trend to consolidate in the industry. A technological glut, the need for systems integration and a shift in emphasis from hardware to software "has produced a lot of upheaval, a lot of turmoil in the industry," according to McClellan.

One MIS manager operating equipment from both companies said he was "amazed" by the news of the potential merger. "The two companies have totally different philosophies, especially in the operating systems area," said Jerry Allen Poe, MIS director with Hall's Motor Transit Co. in Mechanicsburg, Pa., which operates a Sperry 90/80 and a Burroughs B3900. "The Sperry philosophy is to run very close to IBM, but Burroughs' operating system is more user-friendly, though not as flexible."

Poe said he doubted there would be any immediate impact on product lines and that it could result in combined maintenance of both companies' products. He said his company has been considering replacing the Sperry machine with an IBM product but may reconsider if the merger goes through. "We might stay with them and become, essentially, a one-vendor shop," he said.

AT A GLANCE

[illegible]

1984 revenue — $5.68 billion

Employees — 77,000

[illegible]

Large-scale 1984 shipments* and market share — 119; 3.1%

Howard Dix, manager of data services with the Orange County, Calif., administrative office in Santa Ana, Calif., operates three Sperry 1100/70 mainframes and said he would be concerned if the merger resulted in elimination of any Sperry products. On the positive side, he said, "We might be able to get equipment more quickly if the merger expands Sperry's manufacturing facilities."

Similar concerns were expressed by Burroughs' customer Donald Silva, a data services manager with Sun-Diamond Growers of California in Stockton, Calif. "If they try to force us to change equipment or move to Sperry products, it could be a real problem," said Silva, who operates a Burroughs A-9 and a B6810. He added, "If they say convert, or [if] they introduce a new product line more closely linked to the Sperry philosophy, we will certainly explore further than Burroughs and Sperry; we may even go to Big Blue."

Silva said the move could be positive, "depending on who becomes the controlling force."

Similarly, John Jervinis, DP manager for the city of Waltham, Mass., said he would feel more confident about Burroughs after a merger. "It would make Burroughs more secure as a company and allow [it] to offer more service and expertise," said Jervinis, who operates a Burroughs B1900.

This report was compiled by CW staff members Peter Bartolik, John Gallant and Tom Henkel.

IBM Entry Systems to split base between N.J., Fla.

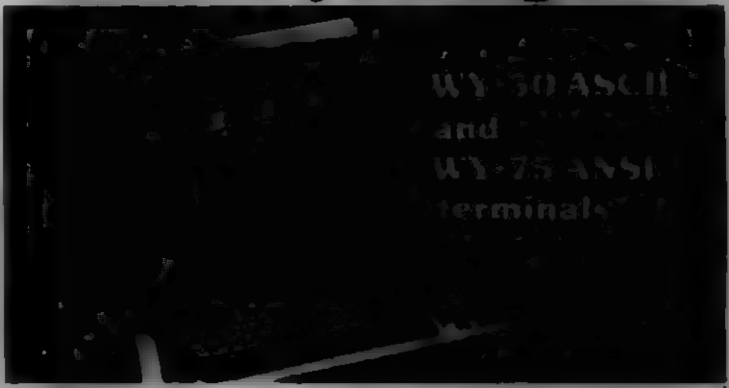
BOCA RATON, Fla. — IBM announced last week that its Entry Systems Division (ESD), based here, will move a portion of its headquarters to Montvale, N.J., in July 1986 "to work closely on a day-to-day basis with other IBM headquarters."

Some 200 members of the ESD headquarters staff will be involved in the move, which signals continuing efforts to tie ESD's operations into overall IBM product strategy. ESD is the division that produced the successful Personal Computer.

ESD President William C. Lowe made the announcement and remarked that the division "has grown from a small business unit with a stand-alone product to a large division with products that are strategically significant to IBM's future."

Since midway through last year, IBM has taken several steps to bring ESD activities more in line with those of the rest of the company. Earlier this year, IBM reassigned ESD founder Philip D. Estridge to a corporate staff position [CW, March 18].

Smart Wyse Bargains



Buy, lease or rent from MTI today.

These are low-cost, smart editing alpha-numeric terminals with 14" tilt-and-swivel non-glare screens and a footprint of less than a square foot. They display 24 rows by 80 or 132 columns, have 16 programmable function keys, and feature soft set-up of terminal parameters from the keyboard. WY-50 compatibility: WY-100, ADM-31, TeleVideo 910 & 925, ADDS Viewpoint, Hazeltine 1500. The WY-75 is fully software compatible with the Digital VT100.

Consultant prescribes cure for medical center's DP ills

CW AT UCCEL

By John Gallant
CW Staff

DALLAS — The diagnosis was simple: The Queen's Medical Center Information Services Department in Honolulu had sacrificed control for productivity.

The bad news was not entirely unexpected, according to the department's director, Gordon Bruce, who had contracted with Uccel Corp. Systems Software Division's Consulting Services for a data center checkup.

Bruce, speaking at Uccel's Systems Software Conference users group meeting here last week, knew his department was understaffed. He was also painfully aware that his 42 staff members were working in a less-than-palatial environment, jammed into the basement of the 500-bed hospital. Queen's Medical Center, which has a staff of some 1,000 doctors and 2,000 other employees, was founded 125 years ago by Queen Emma and King Kamehameha IV of Hawaii.

But the department's past failures and the downturn in the health care industry had made it difficult for Bruce to get much sympathy, let alone increased funding, from the Queen's Medical Center board of directors, which tightly controls Information Services, he said.

In 1975, the board had mandated the implementation of a fully on-line patient management system. But by 1979 the system was still incomplete. That, Bruce said, prompted a restructuring of Information Services. Since 1981, a variety of major systems, including patient management, financial, information center and physician business applications, have been implemented. Work on nearly 20 other applications was also undertaken. But the speed with which Information Services transformed its operations exacted a toll in inefficiency and control.

Sought suggestions, analysis

Bruce asked Uccel's consultants for suggestions on trimming unnecessary costs and obtaining the resources to meet business plans. He also wanted an analysis of the strengths and weaknesses of the department and a comparison of Information Services performance with other data centers.

"Failures in the past had made it very difficult for us to get money from the board," Bruce said. "We were hoping the Uccel study could help us swing the pendulum in the other direction."

The Information Services department operates an IBM 3083B mainframe under MVS that supports 150 terminals and 100 linked micro workstations. Its on-line systems handle roughly 300,000 transactions and 500 batch jobs daily. Over a span of 2½ days, Uccel consultants conducted a variety of studies on the data center's operations.

According to a Uccel representative, the one-CPU data center checkup cost roughly $9,000. It included a review of such objective measures as hardware utilization and performance, Dasd performance, production and test work loads and exception handling. Consultants also reviewed the department's standards and procedures and conducted personnel interviews and work flow analysis, among other things.

At the conclusion of the checkup, which also gave Bruce a look at how his shop's performance measured up to other data centers across the U.S., Uccel consultants outlined more than 30 major problems and recommendations for solving them. The problems ranged from poor tape management to understaffing to the need for IBM CICS tuning.

"I was certain they would not tell me anything I did not already know," Bruce said. "But there were surprises. The data center checkup provided me with the information I needed to restructure our organization."

Bruce is currently at work implementing Uccel's recommendations, and he said he feels he has greater support from upper management. "The third-party objectivity gave us more leverage with management," he said. "In addition to helping me manage better and address new issues, it has helped us get more money and more recognition for the work we do."

Now that he has seen how Uccel conducts a data center checkup, could Bruce undertake one of his own? "We already do parts of the checkup on our own. That helps us stay on track," he said. "But you really need that objective opinion and the interpretation of the findings."

UCCEL

from page 1

agement functions. One such component, the Nova:Save PC Data Protection Facility, was introduced along with the Synova series concept and Nova:Log last week.

Product-level integration

According to the spokesman, most of Uccel's current line is integrated at the product level, meaning that packages have certain limited, predefined interfaces. The Synova series reportedly is designed to allow for full integration of the packages by providing a layered architecture through which all commands and requests for data are controlled.

The spokesman said Uccel is currently developing the remaining modules that will allow its current products to operate within the Synova environment.

The first layer of the architecture, Nova:Log, scheduled for September availability, will provide for a single logon point to all systems products. It is said to manage multiple product sessions without intermediate logon/logoff and it preserves the context of an incomplete session while other sessions are being conducted.

The spokesman said it provides a single point of access to any IBM Vtam application and allows users to move easily between applications. Nova:Log has an introductory price of $18,500.

Facilitates backup

Nova:Save is designed to facilitate the automatic backup of data stored on an IBM Personal Computer hard disk. The micro must be equipped with Digital Communications Associates, Inc.'s Irma board and must be connected to an IBM mainframe under MVS/CICS.

Nova:Save automatically saves micro data to a mainframe disk on a timed basis, the vendor said. The product is available immediately at an introductory price of $9,500.

According to Maria Smith, vice-president of marketing with the Systems Software Division, "Synova represents a new approach to a controlled environment for IBM shops.

"Systems software products, whether from one vendor or many, have always had unique features, such as different command structures. They were automated but not integrated. Synova is the architecture that will integrate all our products into a total environment."

According to Paul Newton, senior vice-president of software products, the first Synova products are the result of a nearly two-year research and development effort.

Future announcements

He said other components of the Synova series, such as the command and communications facilities, will be announced later this year and in early 1986. He said Uccel's own offerings will be augmented by upcoming product acquisitions, some of which are currently in the works.

"We have been building an integrating techpology," Newton said. "The real world is demanding integration and we are launching products based on that demand."

Uccel is located at Uccel Tower, Exchange Park, Dallas, Texas 75235.

Intel eyes further cost cuts, layoffs

SANTA CLARA, Calif. — Intel Corp. confirmed last week that it is considering further cost-cutting actions, including additional layoffs, due to the continued sales slump in the semiconductor industry.

According to Intel spokeswoman Glynis Kaye, the semiconductor manufacturer is "looking at all kinds of options," including layoffs, temporary shutdowns and plant closings.

The company is "drafting contingency plans" in the event that the slump continues. "Business still is definitely down," she explained.

'A lot of rumors'

Asked about reports that within the next two weeks the company will announce layoffs of from 12% to 15% of its work force, Kaye said that "a lot of rumors are going around" and that final plans have yet to be formulated.

Earlier this year [CW, Feb. 25], in its first layoff since 1974, Intel said it was dismissing 900 workers, or 4% of its work force.

That action included dismissal of 500 workers at Intel's systems and components division in Hillsboro, Ore., and 100 at its Phoenix manufacturing plant.

Test facility phased out

Also included was the phasing out of a components test facility in Santa Cruz, Calif., and workweek reductions for wafer fabrication plant employees.

Also last week, the Semiconductor Industry Association (SIA) revealed that average monthly orders for semiconductor sales in March through May were down 57% from the same period in 1984 and down 9% from the February through April period.

Shipments of semiconductors in 1985 will be 20% below the 1984 level, the SIA predicted.

User warns against using multiple data dictionaries

CW AT UCCEL

By John Gallant
CW Staff

DALLAS — When David James asks other users how many data dictionaries they have in place, they are often puzzled by the question.

After pondering for a moment, those users are likely to reply, "Why, one, of course."

To that, he responds, "Are you sure?"

According to James, data administrator for Riggs National Bank, the largest bank in the Washington, D.C., area, users often have a variety of dictionaries operating — even though they may think all their data is under the control of one central system.

Speaking on the future of data dictionaries at Uccel Corp.'s Systems Software Conference users group meeting here last week, James said many software products, especially fourth-generation or information-center-type systems, contain their own dictionaries.

James listed Information Builders, Inc.'s Focus, Martin Marietta Data Systems' Ramis, Applied Data Research, Inc.'s Roscoe and Artificial Intelligence Corp.'s Intellect as examples of software boasting built-in data dictionaries of one type or another.

"Those dictionaries come in many guises," James said. "But they all specify a file definition in front of a file. What you wind up with are a lot of dictionaries in a lot of different products. You end up with many dictionaries, whether you want them or not."

To ensure data control and integrity in an environment of multiple dictionaries, James cautioned, users should centralize their "metadata" — the data about their data. The primary data dictionary, he said, should be linked to all others so it can act as a central directory of data definitions and their locations. At Riggs National Bank, James said, Uccel's UCC-10 dictionary under IBM's IMS performs that task.

"The [central] dictionary should interface directly or via a link to each and every information resource," James said. "There should be one source of control over all the data dictionaries. The main dictionary needs to know what other dictionaries do and what is contained in them. Without that control, you will have multiple data definitions and may be required to do multiple updates."

Cautioned against overloading

James said no new application or information-center-oriented data base extract should be brought online without a link to the main data dictionary. But he also cautioned users against overloading the central dictionary.

"There is no sense in trying to load all other data dictionary information into the main dictionary," he said. "The central dictionary should just point to where the definitions lie in the other dictionaries. Make the main dictionary your reference library."

According to James, data dictionaries in software products fall into six main classes:

- The active dictionary, which ensures that programs and the data base management system will not function unless data definitions are recorded in it.
- The passive dictionary, which maintains data descriptions and usage information but does not drive programs or DBMS.
- The dependent dictionary, which relies on other software, such as a DBMS or operating system, to run.
- The independent, or standalone, dictionary that is able to run on many systems.
- The logical dictionary, in which the business functions of a corporation are defined from a user perspective. This dictionary provides a business view of data, James said.
- The physical dictionary, in which program I/Os and DBMS controls are defined. This class of dictionary provides an applications view of data.

In the future, James said, many organizations will migrate to what he called a "human data dictionary," which will maintain data definitions in common user terms. "The dictionary of the future will know what users are saying," he said. "It will be driven by another data dictionary that links the user definitions with the required DP definitions."

[illegible]

CW AT UCCEL

Ramblings from the floor at Uccel Corp.'s Systems Software Conference users group meeting last week:

- Was it just coincidence that Computer Associates International, Inc. (CAI) unveiled its CA-Unicenter [CW, June 10] system just one day prior to Uccel's introduction of its Synova series software? The announcements appear to signal a convergence of strategies on the part of systems software vendors.

Paul Newton, senior vice-president of software products with Uccel, said CAI's strategy of linking users through CA-Unicenter to CAI's Jericho, N.Y., headquarters was a good idea but one that Uccel was not, at least for the time being, planning to embrace.

Asked about the earlier availability of the full CAI system, Newton responded, "They are saying, 'Here it is right now.' We are saying, 'Here is this portion for right now, and there will be a lot more to come in the future.' "

Newton said that, despite the moves toward product integration on the part of the leading systems software vendors, there will always be a place for exceptional, standalone systems packages. But, he added, those vendors that want to remain major players in the industry will have to integrate their products eventually.

- Prior to the press briefing on the Synova series software, one senior Uccel official commented that applications pricing is something the Dallas-based software and services company is monitoring carefully. The remarks came in the context of a discussion on rumored price wars between applications vendors that, some industry observers claim, are cutting prices by as much as 75% to outbid competitors. In many cases, the official said, software prices are artificially high and may change dramatically in the future.
- General session speaker Jack Jackson, a noted lecturer on strategic planning, chided Uccel about the hoopla surrounding the company's announcement of its Synova series software to the more than 1,300 users in attendance. Actually, Jackson's good-natured jabs were aimed at software vendors in general that, he said, tout their products as panaceas that can transform even the most problem-riddled manager into a "leading-edge executive."

Jackson also took more than a few whacks at airline companies for failing to prepare for the forces currently restructuring that industry and for neglecting to use DP resources to get immediate feedback on the implementation of their strategies.

DP security course set for July

SANTA CLARA, Calif. — A three-day course, "Recent Advances in Computer Security," is scheduled for July 16-18 at the University of California Extension Conference Center here.

The course is intended for security managers and others interested in computer security issues. It will provide an overview of computer technology and discuss recent advances in security products.

James Arlin Cooper of Sandia National Laboratories will conduct the course. He is adjunct professor of electrical engineering with the University of New Mexico at Albuquerque.

The registration fee is $645.

University of California Extension Center is located at 2223 Fulton St., Berkeley, Calif. 94720.

Technology advances to propel AI into micro arena

CW AT FUTURE COMPUTING

By Eric Bender
CW Staff

DALLAS — As artificial intelligence technology spreads from research and development into the real world, what role will be played by the personal computers now found on millions of desktops?

"If AI is going to happen, the bulk of the applications will be on personal computer-type machines," predicted David Squire, AI program manager at Tektronix, Inc.

Speaking last week at the Future Computing, Inc. Forum on AI and Personal Computers here, Squire said that near-term hardware advances, including microprocessors optimized for AI applications, will accelerate AI's move into the micro arena.

"AI-optimized general [microprocessors] will exceed the performance of customized AI processors now," Squires forecast. "We think that will happen within 1½ to two years."

As one example, Squire said, during a recent trip to Japan he saw a demonstration of a Motorola, Inc. 68000 coprocessor plugged into a NEC Corp. personal computer "that runs Smalltalk with about the same performance as a [Xerox Corp.] Dolphin."

AI-optimized chips will begin filtering into personal computers as add-on boards within about a year, said Future Computing chairman Egil Juliussen. "In the 1987-1988 time frame, we see them built into the product," he said, speculating that about half the personal computers shipped might be so equipped.

However, "It's a lot easier to have [personal computers] embedded inside AI machines," said Beau Shiel, product development manager at Xerox Artificial Intelligence Systems.

Optimized to handle resource-intensive tasks, such as function calls and "garbage collection," AI machines may keep standard micros off their turf longer than did dedicated systems for other uses such as computer-aided design, according to Shiel.

Current AI machines typically offer at least 2M bytes of internal memory, high-resolution graphics, "a reasonable amount of raw speed and a significant size of virtual memory," Shiel said. "Some of this is just luxury, but not all of it," he said.

While many expect widespread use of microcomputers as AI delivery vehicles, Shiel pointed out that "a lot of AI applications are as demanding in their machine resources as the development effort [is]."

Although personal computer hardware is evolving rapidly, "It's clear today that the power isn't there," said Jim Spoerl, group manager for product marketing at Symbolics, Inc. in Cambridge, Mass.

However, Spoerl added that he considers personal computers a "major factor in continuing the advance of AI into the real commercial world." Suitable roles will include training, delivery of small AI applications as stand-alone machines and acting as workstations on distributed networks, he suggested.

Meanwhile, other vendors insisted that AI software can do useful work on personal computers today. Paul Robertson, president of Artelligence, Inc., claimed that his firm's implementation of Digital Equipment Corp.'s OPS5 language allows applications to run as quickly on an IBM Personal Computer XT as they do under OPS5 on a DEC VAX.

"The barrier is not the computational power," Robertson said. "With improvements we see in the pipeline, I don't think that's critical."

CW AT GOVERNMENT COMPUTER EXPO '85

Ramblings from the floor of last week's Government Computer Expo '85 in Washington, D.C.:

■ The exposition's keynote speaker urged government DP managers to be more cost-conscious when buying computer hardware and software to avoid the bad publicity on overpricing that has been hitting the Pentagon and its contractors. Maj. Gen. John T. Stihl, the U.S. Air Force's assistant chief of staff for information systems, said that if government managers can build up their credibility with the public, Congress and the White House, the problem of overregulation of computer procurement will be reduced.

■ Stihl also strongly urged government DP managers to evaluate user requirements for information before acquiring computer systems, in part to avoid giving decision makers a case of information overload. "In this world of ever-expanding requirements, we should think about what psychiatrists tell us: Decision makers, under pressure, discard information, avoid bringing in more information and stop exploring new alternatives," he said.

Consequently, he noted, "Information technologies that tend to inundate decision makers with useless data are not a positive influence."

■ The use of integrated software for microcomputers apparently is popular among bureaucrats. In a special program, the 500-member Integrated Software Federal Users Group sponsored workshops on government-oriented applications of integrated packages and in-depth discussions of such products as Lotus Development Corp.'s Symphony.

■ U.S. Rep. Charles Rose (D-N.C.) was one of four people awarded the *Government Computer News* Annual Award for Excellence at the exposition. Rose, who reportedly uses an Apple Computer, Inc. Macintosh, was cited for encouraging other members of Congress to use microcomputers in their offices. He is chairman of the House Subcommittee on Office Systems and founder of the Policy Group on Information and Computers.

Other award winners were James H. Burrows, director of the Institute for Computer Sciences and Technology; Donald J. Herman, executive vice-president of NCR Corp.; and Joseph R. Wright Jr., deputy director of the U.S. Office of Management and Budget.

■ The exposition had a long list of sponsors, all with long names: the Federation of Government Information Processing Councils, the Graduate School of the U.S. Department of Agriculture, the National Association of State Information Systems and the Information Resources Administration Councils. In a letter from the White House, President Reagan sent best wishes to them all.

EMA conference slated for Sept. 4

WASHINGTON, D.C. — The Electronic Mail Association (EMA) has announced that a conference, "Electronic Mail and Messaging: A Preview of the Next Decade," will be held Sept. 4 at the Mayflower Hotel here.

Discussion will include the X.400 international standards, which have been ratified by the Consultative Committee on International Telephone and Telegraph. Speaking will be Sen. Patrick J. Leahy (D-Vt.), a congressional leader on computer privacy and security issues.

The chairman of both the conference organizing committee and the EMA is Richard W. Coughenour.

The registration fee is $175. EMA is located at Suite 300, 1919 Pennsylvania Ave. N.W., Washington, D.C. 20006.

Firms in 'embryonic' AI mart pin hopes on growth

CW AT FUTURE COMPUTING

By Eric Bender
CW Staff

DALLAS — Although real-world applications of artificial intelligence technology are increasing rapidly, "the business is extremely embryonic," said Ralph Kromer, president of Intellicorp in Menlo Park, Calif.

"We're really in the technology transfer business," Kromer remarked at a Future Computing, Inc. conference on AI and personal computers here earlier this month. "We have to provide a considerable amount of training, consulting and applications support, and we can't tolerate very many failures."

No AI software firm has reached $10 million in annual sales, and "we're all fighting for survival," Kromer commented.

Other speakers at the Future Computing meeting also underlined the industry's immaturity. "Most of us in this market are in a cascade of vendors, all selling to each other," said Beau Shiel, product development manager at Xerox Artificial Intelligence Systems in Palo Alto, Calif.

"This isn't an industry so much as a bunch of hardware and software technology trying to get to the market," said Tim Williams, senior analyst at Future Computing. Among Fortune 1,000 firms, "even those who are spending hundreds of thousands or millions of dollars are just beginning to come out of the prototype stage."

But the conference presentations emphasized the AI market's tremendous long-term growth potential as well. Kromer noted that the installed base of system licenses for Intellicorp's Knowledge Engineering Environment product, which stood at only 40 last September, has doubled or better in each succeeding quarter.

Art Beane, manager of product management at Digital Equipment Corp.'s Artificial Intelligence Group, estimated that the value of the AI market will rise from $30 million in 1983 to between $190 million and $300 million this year and between $720 million and $11 billion in 1990.

"I can count over a thousand applications being developed by companies for vertical markets," said Larry Geisel, president of Carnegie Group, Inc., a Pittsburgh-based software vendor. The aerospace, automotive, electronics and defense industries "are all making major, major commitments to AI," he said.

Among hardware advances that will help to drive the market for resource-hungry AI applications, executives said, are 32-bit general-purpose microprocessors, multiprocessor architectures, 1M-bit random-access memory chips and very large-scale integration processors customized for AI applications.

One example of upcoming AI silicon is a 32-bit chip being developed by Texas Instruments, Inc. that executes Common Lisp, designed as a functional replacement for the company's Explorer machine and funded by the U.S. Department of Defense's Defense Advanced Research Projects Agency, noted Joe Watson, TI's vice-president for digital systems.

The experts also sounded a general note of caution against raising customer expectations too high. "What I fear the most are exaggerated product claims," said Future Computing Chairman Egil Juliussen.

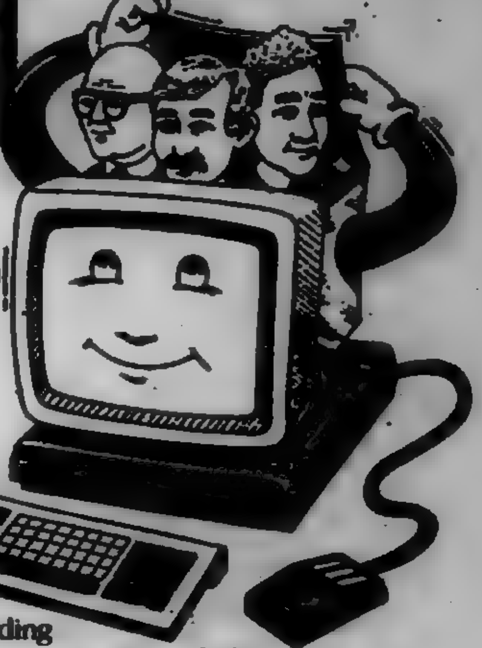
Simulation meet planned for July

CHICAGO — The Society for Computer Simulation is sponsoring the Summer Computer Simulation Conference July 22-24 at the Westin Hotel here.

The keynote address, "Computer Simulation and the Demand Reality," will be given by Edward E. David Jr., president of Exxon Research and Engineering Co. in Annandale, N.J. There are a number of full-day sessions scheduled on several topics.

Registration for the conference costs $175 for society members and $200 for nonmembers. Additional fees are $400 for the expert system seminars and $150 for the panel discussions. The Society for Computer Simulation can be reached through P.O. Box 17900, San Diego, Calif. 92117.

Learn Artificial Intelligence From The Greatest Minds In The Field



The Institute of Artificial Intelligence has assembled the leading AI practitioners in one place this summer, to transfer their knowledge to you.

People like Dr. Peter Hart, Founder, Syntelligence; Rick Hayes-Roth, Chief Scientist/Co-Founder, Teknowledge; Dr. Tom Kehler, Executive VP/GM, Intellicorp; John McDermott, Associate, Computer Science Dept., Carnegie-Mellon; David Elliot Shaw, Director of NON-VON Supercomputer Project at Columbia U.; and more.

Our hands-on, practical curriculum will turn computer engineers into qualified AI/Knowledge Engineers, able to apply their training to solving real-world problems.

Select from a series of over 25 courses including Managing AI Projects, LISP, Logic Programming, AI Programming, Knowledge Engineering, and numerous special topic seminars such as Machine Vision and Natural Language Programming.

Corporations: send us a group of engineers and managers, and we'll send back a functioning AI team, in 8 weeks.

Engineers: this may be the best move you've ever made to enhance your career and your value to your company.

Sign up for the Summer Session, which runs from June 24 through August 16, 1985, held at Harvey Mudd College, the outstanding Engineering and Science School of Claremont Colleges in California. Classes are filling quickly, so call today.

Kurzweil introduces word recognition peripheral

KVS 3000 vocabulary includes 1,000 words

WALTHAM, Mass. — Kurzweil Applied Intelligence, Inc. last week announced a programmable computer peripheral, or board-level device, that reportedly recognizes up to 1,000 spoken words with an accuracy of approximately 96%.

Marketing Director Robert Joseph said the Kurzweil Voicesystem 3000 (KVS 3000) can be used in data entry applications, for command of financial and word processing software and for medical and insurance form reporting.

Joseph said Xerox Corp. and Wang Laboratories, Inc., both investors in the Kurzweil speech recognition enterprise, may market the KVS 3000 along with their own systems. No final agreement, however, has been reached with the two companies, he said.

Compares words with speech tokens

The KVS 3000 is said to compare words spoken into a microphone with a memory of 3,000 sample speech tokens. To program the memory, a user types in 1,000 chosen words. In response to prompts, one or more users then repeats each word into the machine three times.

At that point, the programmed memory will contain 3,000 speech tokens, three for each word. The machine displays the utterances in its memory that most closely match the spoken words. The word recognition process takes an average of 50 msec, the vendor said.

The KVS 3000 is scheduled for third-quarter availability. Shipments to beta users are scheduled for this month, a spokesman said.

Increments of 3,000 tokens

The KVS 3000 reportedly can be expanded in 3,000-token increments to a total of 15,000 tokens by adding more memory boards. The expanded configuration offers a total of 5,000 words of speaker-dependent recognition, enough vocabulary to support limited text dictation applications, according to the vendor.

The KVS 3000 is available either as a board set for use with host systems compatible with Intel Corp.'s Multibus or as a self-contained 18-lb desktop package with RS-232 output, a spokesman said. The KVS 3000 will also be offered with Microsoft Corp.'s MS-DOS software for standard microcomputer systems, Kurzweil said.

The product includes three boards: an audio processor for handling analog signal conditioning and analog-to-digital conversion, a pattern processor that stores acoustic patterns and provides real-time recognition processing and a speech processor for coordinating the activities of the audio and pattern processor.

The hardware is said to include a Motorola, Inc. 68000 microprocessor, 640K bytes of random-access memory for program and data storage and the company's programmable digital filter chips, which aid the signal processing and conditioning task, according to Kurzweil.

Adapts to user speech patterns

The system's software is designed to adapt itself to a user's speech patterns, with improved performance over time. The system reportedly continues to collect samples of speech during actual work.

The company refers to the KVS 3000 as a building block for a 10,000-word speech-to-text system, which is scheduled for delivery in the fourth quarter of 1986. The company said that there are distinct differences between voice recognition and speech recognition systems.

A voice system discriminates between words but not homonyms. A speech system, however, has linguistic software that recognizes homonyms and punctuation, Joseph said.

Word recognition vs. speech recognition

The 10,000-word Voicesystem will be a word processing system, but the KVS 3000 is a word recognition system and not a speech recognition system. Joseph said the average executive can meet 98% of letter- and report-writing needs with a 10,000-word vocabulary. Shakespeare, he said, used 39,000 words in all his writing.

The KVS 3000 is sold as a self-contained package with RS-232 interface for $6,000. With the IBM Personal Computer XT or AT interface, the price of the package is $6,500. As a Multibus-compatible board set, the system sells for $5,000, with discounts for OEMs.

Additional memory boards with a 3,000-token capacity each will be sold for $2,000 each, or $3,000 each in a package with RS-232 output. The additional boards are scheduled for fourth-quarter delivery.

Kurzweil is located at 411 Waverly Oaks Road, Waltham, Mass. 02154.

Poll finds DP hiring up

CLEVELAND — Job seekers in data processing should expect their chances to improve moderately in the second half of this year, according to a recent poll by Management Recruiters International, Inc., a recruiting firm here.

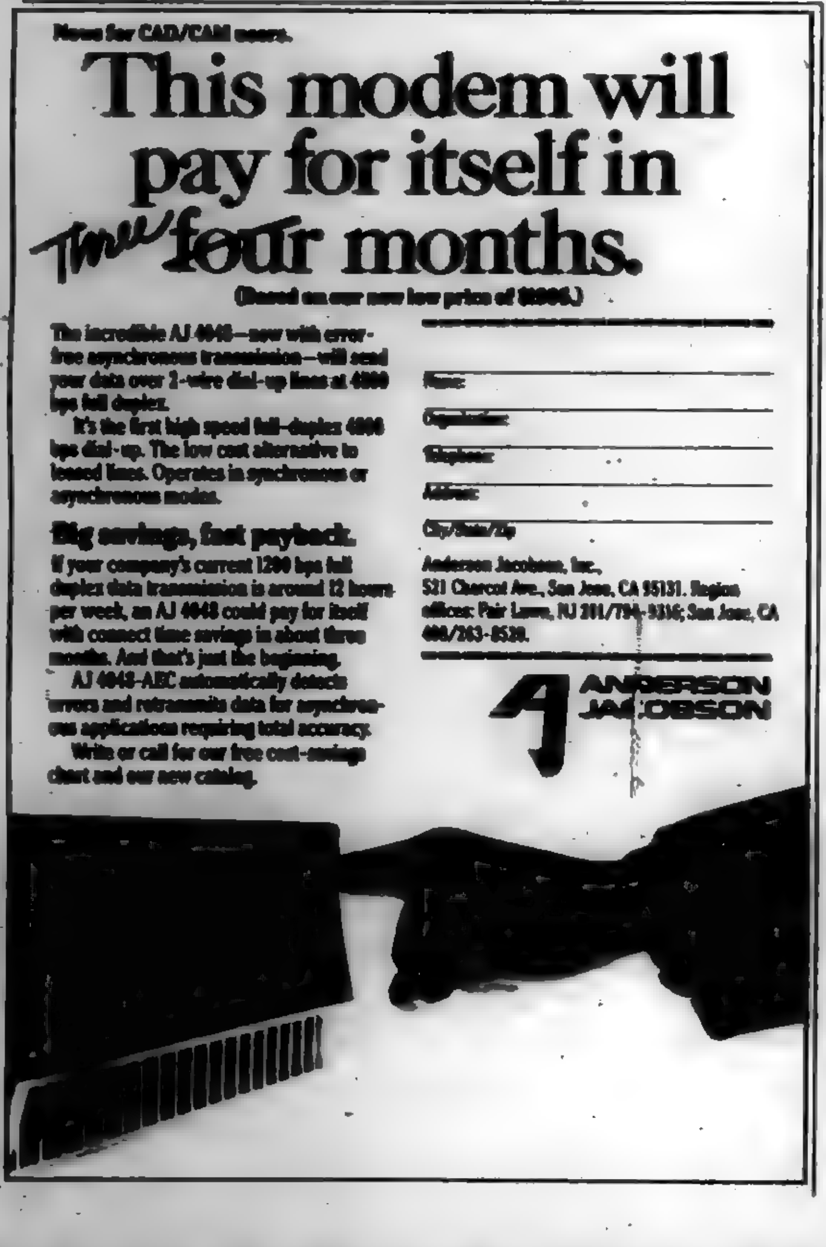
The survey found 41.7% of the 436 firms polled would increase their hiring in the next six months. For the first six months of 1985, an earlier poll taken by the same firm had found 35.8% of respondents expected to increase their hiring, a projection 5.9% less than the current one.

Only 7.1% of the latest poll's respondents said they would decrease hiring, while 50.7% said they would maintain their current levels, Management Recruiters said.

As for which areas of the country will do best, the poll singled out the South Central states, including Georgia, Alabama and Tennessee, and the North Central states, including Illinois, Wisconsin, Ohio and Michigan. Fifty percent of the companies responding from the South Central region said they would increase their data processing staffs.

When the responding firms were grouped by industries, the winners — those firms that would increase their hiring — were the electrical industry and the transportation and communications sectors.

The losing firms were the construction, lumber and wood, fabricated metal products and machinery industries.



News for CAD/CAM users.

This modem will pay for itself in Three ~~four~~ months.

(Based on our new low price of $[illegible].)

The incredible AJ 4048—now with error-free asynchronous transmission—will send your data over 2-wire dial-up lines at 4800 bps full duplex.

It's the first high speed full-duplex 4800 bps dial-up. The low cost alternative to leased lines. Operates in synchronous or asynchronous modes.

Big savings, fast payback.

If your company's current 1200 bps full duplex data transmission is around 12 hours per week, an AJ 4048 could pay for itself with connect time savings in about three months. And that's just the beginning.

AJ 4048-AEC automatically detects errors and retransmits data for asynchronous applications requiring total accuracy.

IDEA IS SHIPPING A 5250 TWINAX EMULATOR WITH A UNIQUE FEATURE.

IT WORKS.

Last Fall, two major companies announced a twinax board for PC-to-IBM System 34/36/38 communications. Today, only one company is shipping a product that's fully functional: IDEA.

Unlike our competition, the IDEAcomm 5251 twinax board comes complete with software. This may explain why the thousands of units shipped since December are making IDEAcomm 5251 the industry standard worldwide.

You'll also find many third-party software packages for the System 3X supporting our board: Decisionlink™ and Interlink,™ for example.

But our customers have found lots of other reasons to choose IDEAcomm 5251.

We provide a "hot key" capability, hard disk access, printer support, four concurrent host sessions, and data transfer. Plus, our customers who benchmark IDEAcomm 5251 tell us that it's incredibly fast.

And IDEAcomm 5251 does all this and still requires only 30K of memory on your PC.

So if you want a 5250 twinax emulator with performance rather than a promise, call IDEA at 800-257-5027.

U.S. agency faces probes, boosts security after audit

Interior questioned lottery procedures

By Mitch Betts
CW Washington Bureau

Computer security is being strengthened at the U.S. Bureau of Land Management's (BLM) computer center in Denver, following an internal investigation that indicated inadequate controls could jeopardize the integrity of the BLM's computerized lotteries for oil and gas leases.

In March, the inspector general of the U.S. Department of the Interior issued an audit report citing the Denver Service Center for inadequate controls over passwords, a lack of audit trails and faulty operating procedures.

Because of the inadequate security, the Office of the Inspector General reported that it could not vouch for the integrity of the BLM's computerized lottery and could not determine whether the lottery had been manipulated to favor certain energy companies, the audit said.

In response, Bobby Hooker, the BLM's computer security officer in Denver, said, "We're developing stricter management features to better control access to the system." He indicated that the stricter controls cover audit trails, passwords and access to the system.

Questions about BLM's computer security surfaced last October when the BLM awarded drilling rights on federal land tract W-698 in northeastern Wyoming to Seco Energy Corp., the same firm that had requested that the tract be included in the lottery. The bimonthly lottery is supposed to pick winners at random.

The Federal Bureau of Investigation, the Interior Department and the U.S. House of Representatives' Committee on Interior and Insular Affairs reportedly are investigating the lottery to determine whether Seco's win was a coincidence or not.

The inspector general's audit concluded that, "because of poor internal controls and the lack of audit trails in the automated process, we could not prove that the [lottery] system was manipulated to the benefit of one or more applicants. However, because of the same weaknesses and other deficiencies, we do not have confidence that the [lottery] was not manipulated."

The audit, conducted in November and December, cited the following problems:

- Passwords for most leasing programs and data were changed only once in the past year. Also, passwords, when entered at a VDT, were not automatically deleted or rendered illegible, thus allowing unauthorized persons to obtain them through observation.
- Keywords used to access the most sensitive computer programs also were not changed frequently or periodically. "Responsible personnel informed us that the last date of change was unknown but estimated the keywords had not been changed in the last two years," the audit said.

> *Because of weaknesses and other deficiencies, we do not have confidence that the [lottery] was not manipulated.*
>
> — U.S. Department of the Interior audit report

- The computer center did not use the system's activity log as an audit trail, and no one was assigned to monitor the activity log for irregular or suspicious activity. The random number assigned to the lottery winner was not kept for confirmation.
- Computer programs and subsequent changes to them have not been documented. Also, there was no validation testing of the random-number algorithm in the last five years, prompting doubts about the randomness of the numbers generated.
- The "computer files were accessible and could easily be displayed by any user of the BLM computer system. This feature of the system further reduces confidence that the [leasing] programs and data files are free from unauthorized use or manipulation," the audit said.
- Computer programmers develop and test computer programs for the lottery in the same working area as the computer running the lottery. This could result in the wrong computer program being executed in the lottery, the audit said.

Hooker said the BLM is implementing the security improvements recommended in the audit report. He declined to discuss the additional security measures.

Other BLM officials said the reforms include changing the password at least four times a year, ensuring that passwords are not displayed on the VDT screen and monitoring an audit trail. However, documenting the computer programs will be difficult, according to Delmar D. Vail, director of the Denver Service Center, because of problems in recruiting qualified workers to do the job.

No other Conference can touch it for Quality...Depth...Scope.

TWO SPECIAL TRACKS

Special Theme Track—
Tying It All Together
The first public discussion of work at NBS and elsewhere aimed at permitting the exchange of data, text and graphic information in a multi-vendor environment — that could ultimately lead to tying together computer systems throughout the Federal government.

3rd Year Special DOD Track—
Going Beyond the State-of-the-Art
Focusing on the cooperative efforts of government, industry and academia, this track will cover how major Consortia are working to bring about the next-generation of computing capabilities necessary to meet DOD's goals for the 1990's.

This year's Conference is the most comprehensive yet!

PLUS— Full 3-day Seminar program with over 150 speakers and 50 sessions on microcomputers, software, networks, management issues, products and new technologies.

PLUS— Washington's largest Exposition of computer and communications equipment, systems and services representing every leading company in the industry.

"The Exposition is an education in itself."

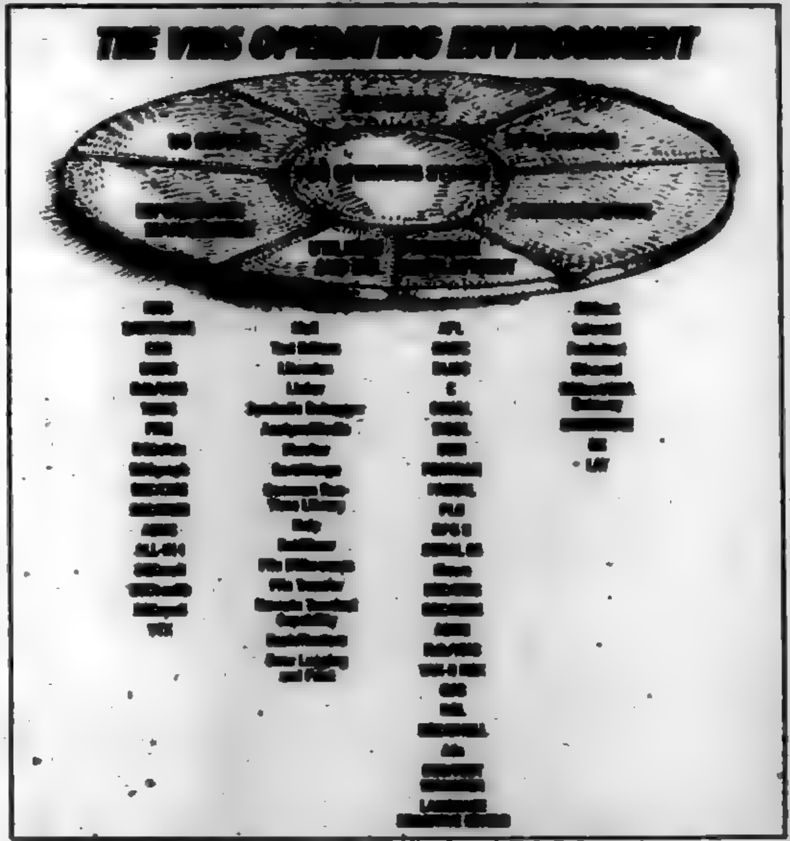
"I WANT IT NOW."

VMS. WHEN THE ONLY THING YOUR USERS WANT IS EVERYTHING, NOW.



If "I want it now" seems like the only thing you ever hear from your users – and if your applications backlog is telling you that "now" is going to be a long way off – you need to know about our VMS™ Virtual Memory System software.

Our VMS software, which was designed exclusively with VAX™ computer systems, is far more than a mere operating system. It is a complete operating *environment*. One that can encompass all the ways you use computers. To get it done, now.

The VMS operating environment provides you with the industry's most complete set of utilities and software products for program development and system management. Interactive, realtime, even background batch applications can be developed with ease and speed.

Everything you need for corporate-level applications is included. Advanced office automation software. Proven transaction processing capabilities. Comprehensive CODASYL-compliant and relational database managers. User-friendly query tools and an integrated data dictionary. Plus the industry's most complete set of local and wide area networking facilities, allowing you to exchange data files and cooperate with systems made by IBM – via SNA gateway – as well as many other vendors.

VMS PUTS YOUR PROGRAMMERS IN THE FAST LANE.

You've heard a lot of promises about increasing programmer productivity over the years. After all, the application backlog in most companies has reached 18 months to 2 years. And the demand for new applications is increasing by some 50 percent a year. So there's hardly a more important subject.

Digital's VMS software does more to increase programmer productivity than any other system can. Because it combines everything you need for application design, development and maintenance into a single, integrated operating environment.

You'll have the industry's best symbolic debugger to work with. A command language so flexible it lets you stop application execution and enter new commands at any point, and even develop your own commands through its macro facility. A common runtime environment that lets you reuse code instead of rewriting it. And more advanced languages than any other system – some 16 in all, including Ada,® C, COBOL, FORTRAN, and Lisp – all of which you can combine in a single program through the common calling standard.

This gives you a distinct advantage in team development projects. Each developer can use the language best suited to his or her talents and to the task. The end result – better code in less time.

The point is, the VMS environment simplifies development not only for small, ad hoc projects – but also when your applications reach highly sophisticated, complex levels.

And with more than 2,000 applications now available from Digital and independent vendors, you begin to know why our VMS environment does more than any other system to give your company satisfied, productive users at every level.

WITH VMS, FLEXIBILITY IS BUILT IN.

You get another big advantage when you develop your applications with the VMS operating environment: the range of hardware you can run them on. Namely, our VAX computer family, the industry standard for 32-bit computing.

The VMS environment spans the entire VAX systems family, from the smallest MicroVAX™ system to the largest VAX 8600™ and multiprocessor VAXcluster™ systems. This is the biggest software-compatible growth path in the world. And with the data security mechanisms built into VMS software, increased access doesn't mean compromised security.

What's more, if you need UNIX® software capabilities, the VMS operating environment can readily provide them through the VNX™ option. Your choices are never limited when you start with the VMS environment.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

Digital's VMS operating environment, like all Digital hardware and software products, is engineered to conform to an overall computing strategy. This means that our systems are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy direct from desktop to data center.

For more information about how our VMS operating environment can help you cut your applications backlog, contact your local Digital sales representative. Or call 1-800-DIGITAL, ext. 219.

THE BEST ENGINEERED COMPUTERS IN THE WORLD.

Congress ponders ban on sales to South Africa

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The U.S. Congress is on the verge of passing legislation that would ban the sale of computers, computer parts and software to South Africa's government. The legislation is part of a package of economic sanctions against that country's apartheid policy.

The U.S. House of Representatives and the Senate Foreign Relations Committee already have passed slightly different versions of the legislation. Sometime before Congress' July 4 recess, the Senate is expected to approve the committee bill, according to Claude Allen, spokesman for the Senate panel.

Section 7 of the House bill (H.R. 1460) states: "No computers, computer software or goods or technology intended to service computers may be exported, directly or indirectly, to or for use by the government of South Africa or any corporation, partnership or other organization which is owned or controlled by the government of South Africa."

Certain exemptions

The provision does not apply to donations of computers to primary or secondary schools. The bill levies stiff penalties on violators, including a $1 million fine for businesses and a five-year jail term for company officials.

The House legislation, which also bans new investments in South Africa by U.S. businesses, was approved June 5 by a 295 to 127 vote.

Rep. Howard L. Berman (D-Calif.) is the author of the computer export ban in the Anti-Apartheid Act of 1985. Berman said U.S. companies supply 70% of the computers sold in South Africa and argued that these computers help the government to enforce its racial policies.

Take computers out of their hands

"The only way that we can ensure that no American computers are used to enforce apartheid is to take computers out of the hands of all South African government agencies," according to Berman.

Berman said that detailed dossiers are kept on South Africa's blacks to monitor their movements and activities. "Computers are used to collect, retrieve and employ this information in the repression of those who fight to eliminate apartheid," he asserted.

The Senate Foreign Relations Committee's bill (S. 995) has a somewhat more limited scope than does the House bill. S. 995 bans the sale of computers and software to those agencies of South Africa's government that enforce apartheid. The committee approved the bill on June 4 by a 16 to one vote.

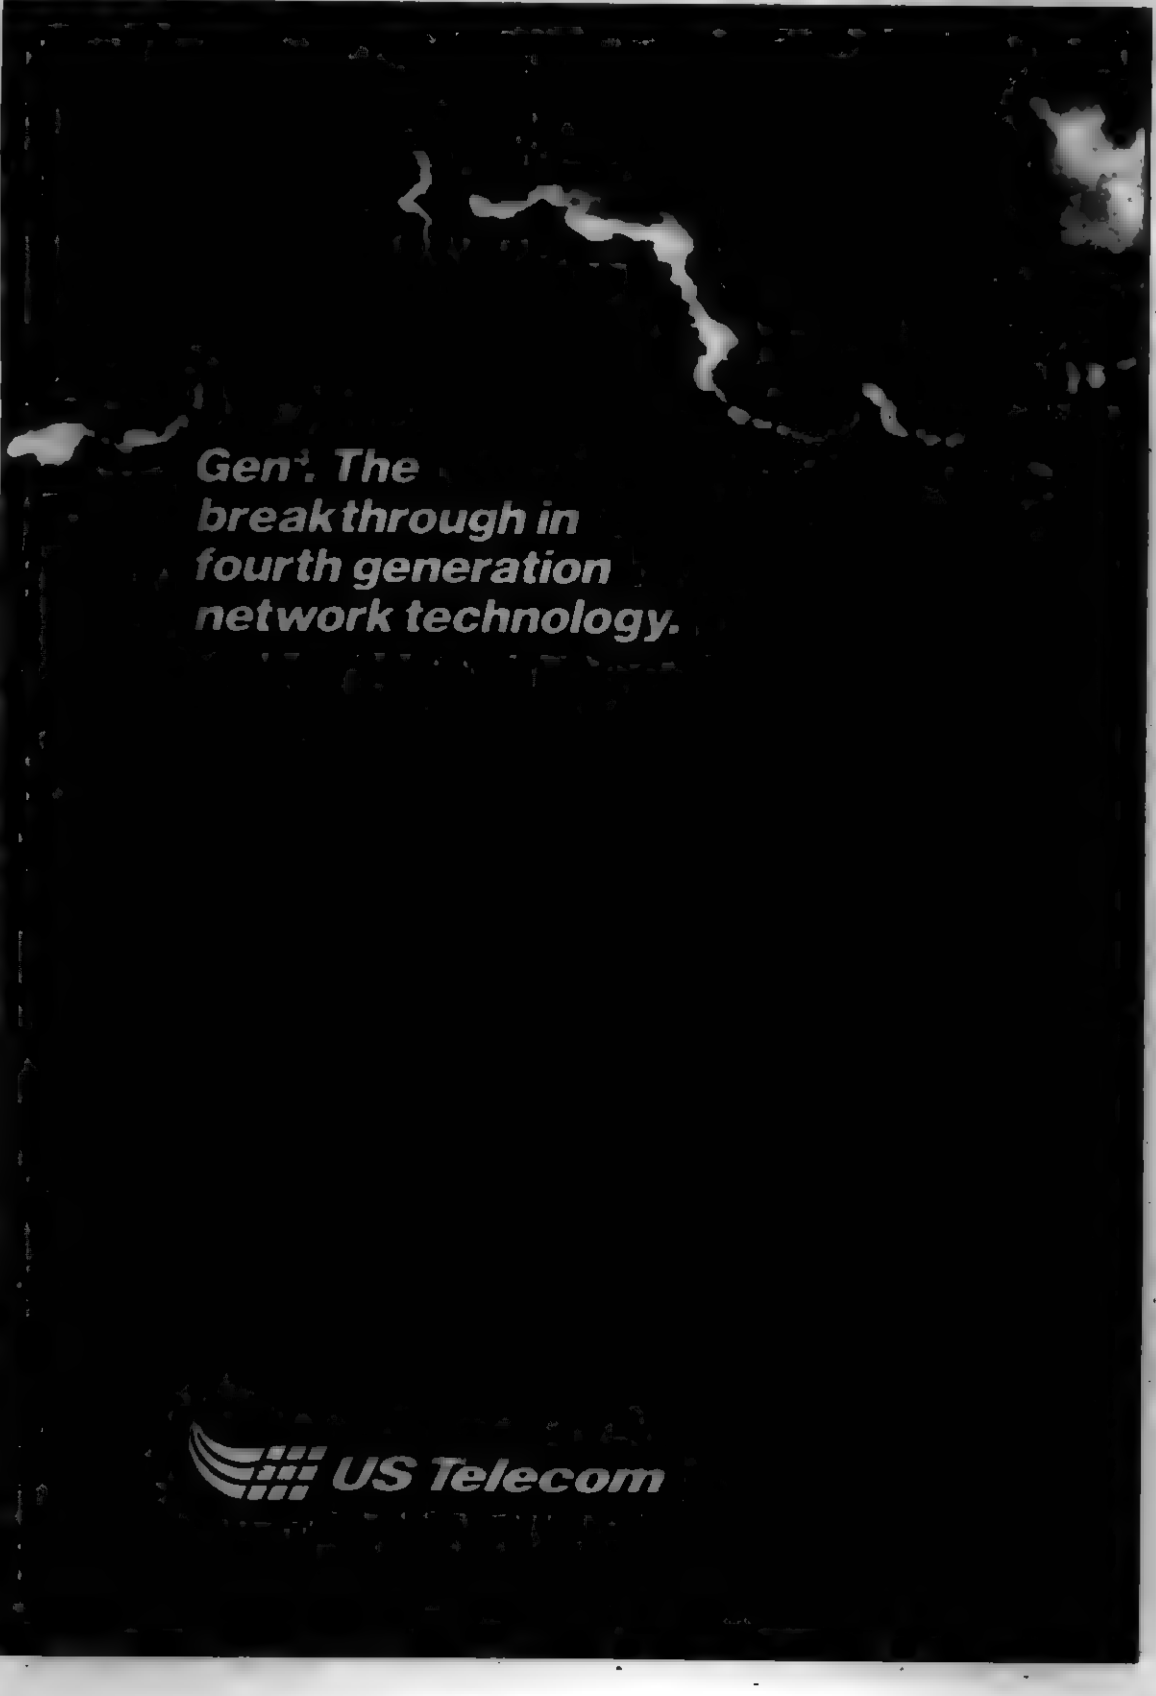
Rep. Berman, opposing this approach, said it would be fruitless to try to distinguish between "good" and "bad" agencies. "Many [computers] have been purchased through the government's central purchasing agent, the State Tender Board. It is all but impossible to track the use of an American computer once it has been sold to the central purchasing office," he said.

Cbema supports Senate bill

The Computer and Business Equipment Manufacturers Association (Cbema), based here, supports the Senate approach and strongly opposes the broader House bill, according to Cbema spokeswoman Charlotte LeGates.

She said that S. 995 correctly limits the ban to the apartheid-enforcing agencies that need to be sanctioned. The House bill, on the other hand, is too broad, will have no effect on apartheid and will allow U.S. competitors to jump into the market, LeGates said.

The Reagan administration opposes both versions of the legislation, raising the prospect of a possible presidential veto. Administration officials said the legislation would discourage U.S. businesses — some of which provide jobs to South African blacks in desegregated workplaces — from remaining in that country.



Gen^4. The breakthrough in fourth generation network technology.
US Telecom

Feedback '85 fall meet set

TOPEKA, Kan. — Feedback '85, the 10th annual conference for users of the Ken Orr and Associates, Inc. Data Structured Systems Development method of software and systems design, will be held Oct. 8-10 at the Holiday Inn Holidome here.

The conference theme will be computer-aided software engineering. Speakers will discuss trends, problems and the potential future of automated software engineering and knowledge engineering tools.

Master of ceremonies will be Nastec Corp. President Jim McGuire, whose company has developed a computer-aided systems development environment, the Nastec Design Aid.

Cost of the conference is $500 before Sept. 6 and $550 after that date, according to the sponsor.

For additional information, Ken Orr and Associates is headquartered at 1725 Gage Blvd., Topeka, Kan. 66604.

Copyright council formed

WASHINGTON D.C. — Several trade organizations and businesses recently announced formation of the American Copyright Council, which will begin a public education campaign about the importance of copyright protection for creative works, such as computer software.

Charter members include the Association of Data Processing Service Organizations, Inc., the Computer and Business Equipment Manufacturers Association and the Information Industry Association, as well as publishing, entertainment and art organizations.

Council officials said that without copyright protection many creative industries could disappear, hurting the economy of the U.S. "Copyright is the wellspring of a $141 billion industry," said Stanley Gortikov, chairman of the council. "Yet copyright is more and more at risk these days. It is becoming an endangered species," he said at a recent meeting here.

Copyright is threatened by new methods of duplicating copyrighted works, such as photocopiers, tape recorders, videocassette recorders and personal computers, officials said. "The revolution in computer and telecommunications technology provides storage and instantaneous transmission of copyrighted works on a scale not previously known," a council statement said.

The council's Declaration of Mission and Principles stated that copyrights provide the marketplace with creative works at reasonable prices, compensate creators for their efforts, encourage creativity and induce public dissemination.

Copyright principles are neither outmoded nor are they obstacles to advancement in technology, the statement said. "Copyright can, as it has in the past, coexist with technology," it said.

The council is located at 1300 New Hampshire Ave. N.W., Washington, D.C. 20036.

N.J. court strikes down law banning Sunday system use

By Charles Babcock
CW New York Bureau

PARAMUS, N.J. — Companies that want employees to operate computers on Sunday are no longer breaking the law in here.

The borough's blue law prohibiting "worldly employment" on Sunday has been struck down by an appeals court.

"This decision will relieve the stigma on Paramus. It will help us fill some of our office space," said Ralph Henig of Mack Co., an office building developer who challenged the law.

Paramus Mayor Joseph Cipolla, a defender of the blue law, said, "It isn't a dead issue," and has directed attorneys to petition the N.J. Supreme Court to review the case.

While conceding that the blue law hurt office space rentals, Cipolla said the borough allowed exceptions. The American Bureau of Shipping, a sea freight company, was told by the mayor and council prior to the court decision to move into a Paramus office building. It would be allowed to have an employee work on its computers on Sundays by notifying police when doing so, he said.

Paramus' interpretation of worldly employment was so strict that its police once arrested a lawyer for writing a brief at his office on Sunday and a graduate student for working on her degree at her place of employment, an IBM Product Center.

Cipolla said the blue law was never intended to single out computer work but was construed in the strictest sense possible to keep retailers closed. Paramus is a crossroads community a few miles from the George Washington Bridge leading into New York's borough of Manhattan, and the residents wanted a day's relief from traffic, the mayor said.

MIT's Rockart to address SIM conference slated for Sept. 8-12

BOSTON — The director of MIT's Sloan School of Management will be the keynote speaker at the Society for Information Management's (SIM) annual conference here Sept. 8-12.

John F. Rockart will speak on management strategies of end-user computing, SIM said. Also scheduled to speak is James Martin, an author and lecturer.

The conference will focus on managing the end-user computing explosion and will include coverage of such topics as managing the marketplace for end-user computing, integrating office automation with other systems and investigating the emerging software technologies.

The conference will feature eight workshop sessions and the national SIM research paper presentation. Conference and workshop registration costs $1,175 for members, $600 for faculty members of SIM and $1,295 for nonmembers. Conference-only registration is $895 for members, $450 for faculty members of SIM and $995 for nonmembers. Workshop-only registration is $350 for members, $250 for faculty members and $395 for nonmembers.

The SIM Conference Office is located at Suite 600, 111 E. Wacker Drive, Chicago, Ill. 60601.

Japanese chip designs granted protection by U.S. patent office

WASHINGTON, D.C. — The U.S. Patent and Trademark Office recently granted copyright-like protection for Japanese semiconductor chip designs.

The Semiconductor Chip Protection Act of 1984, which provides special legal protection against the copying of original chip designs, also makes foreign chip designs eligible for protection in the U.S. under certain conditions.

"The record supports the conclusion that the Japanese government is making good-faith efforts and reasonable progress toward enacting legislation that would be in compliance with the U.S. law," according to Donald J. Quigg, acting U.S. commissioner of patents and trademarks.

The order was the first one that involved chip protection for another nation since enactment of the U.S. law in November (CW, Oct. 10, Jan. 21).

The law provides a 10-year term of protection for original "mask works" either from the date of registration with the U.S. Copyright Office or from the date of the first commercial exploitation.

The order is retroactive to Nov. 8, 1984, and it terminates on June 6, 1986.

VDT-related laws pass in two states

Two more states recently added laws pertaining to the use of VDTs.

In Rhode Island, the nation's first VDT bill to become law this year requires the state's Department of Labor to produce a brochure on VDTs in the workplace and to conduct workshops and training sessions on VDT operation.

Although not directed specifically at VDT workers, a new Maine law now mandates 30-minute rest breaks for every six hours of work for all state and private employees. The bill applies to all workers in the state, including VDT operators.

This year, VDT-related legislation was filed in more than 20 states.

BECOME A CICS CONSULTANT IN JUST TWO WEEKENDS!

We know that it's tough for consultants to fit a weekday course into their hectic schedules. That's why SysEd offers special CICS training courses for consultants that you can complete in only two weekends.

Our intensive weekend courses in Command Level, Macro Level, Internals, Application Design and VSAM are designed to make even non-CICS programmers immediately productive in a CICS environment. Each SysEd course provides a true-to-life learning experience with "hands-on" use of the computer; up-to-date, practical information, a solid foundation in CICS fundamentals and insights into advanced materials; and individual attention from highly qualified instructors.

SysEd's special weekend courses for consultants are held regularly at our classroom/computer facilities in New York City, Chicago, San Francisco and Dallas. Because class size is limited, applications are on a first come, first served basis.

AUSTRALIA

CANBERRA — Promises made were promises kept when the federal government approved a 150% tax write-off for research and development efforts here. The legislation delivered by Australia's Ministry for Industry, Technology and Commerce goes into effect July 1.

•

SYDNEY — The first system crash happened at the New South Wales Health Department before the agency even switched on its brand-new Digital Equipment Corp. VAX 8600. After delivery to the site, the VAX 8600 system crashed through the floor of the computer room and narrowly avoided plunging out a window, sources reported. The department, which had the computer room built by a third party rather than DEC, fortunately had opted for DEC's insurance plan. DEC Pty. Ltd. replaced the damaged machine within a week, a spokesman said. The embarrassed health department is presently conducting an investigation into the cause of the accident.

•

SYDNEY — A newspaper publisher here is so confident of Facom Ltd.'s reliability that it will upgrade its current dual system with a single M3800 mainframe. "We've never had a reliability problem where the whole show is off the air during the six years we've been using the two smaller Facom M160s," said Frank McMahon, DP manager for John Fairfax and Sons Ltd. The paper had used one system for on-line processing and the other for batch purposes and for backup in emergencies, but an emergency never occurred, McMahon said.

BELGIUM

BRUSSELS — Europe will capture roughly 30% of the world market for new technologies, which translates to 10 million new jobs, according to industry guru Etienne Davignon.

The European Economic Community, which will consist of twelve member countries as of January 1986, can combine in an open market 25% larger than the U.S. market, Davignon claimed. It is not the technology that will spell success for the European high-tech community, Davignon argued, but rather Europe's political infrastructure.

•

BRUSSELS — Belgium's Postal Telephone and Telegraph (PTT) agency is planning to extend its videotex service to up to 10,000 subscribers this year. The system runs on Videogate front-end computers, which are manufactured by British Microscope, and has a current user base of 5,000, a spokesman said.

The network conforms to European videotex standards and is able to support French Teletel and the UK's Prestel videotex services. Belgian videotex subscribers reportedly have access to public and private information services and to international networks. The Belgian PTT's videotex service is expected to improve its financial standing. The agency posted profits of $5 billion for 1984 and losses of $500 million in 1983.

ENGLAND

LONDON — Japan's biggest micro manufacturer has turned its back on IBM, vying to become the No. 1 alternative supplier here. NEC Corp. has launched the APC III in the UK, with a promise to work closely with British software houses to develop products for its micro. The product is a single-user, stand-alone system priced at $3,300 for a monochrome

The IBM family of personal printers just got more versatile...

IBM Proprinter

Spreadsheets or mailing labels. Legal memos or movie scripts. Wiring diagrams or seven-color pie charts.

No matter what you do with your personal computer, one of IBM's family of personal printers is built to meet your needs. And now our family has two new members.

First, the IBM Proprinter. A full-featured dot-matrix printer that combines exceptional reliability with a surprisingly low price of under $550. It has three printing speeds for fast first drafts and near-letter-quality correspondence. It takes perforated computer paper for long jobs and—without removing the paper—will easily print one sheet of [illegible]

Second, [illegible] highly [illegible]

screen and $3,800 with a color screen. It comes with the NEC Foundation Package, a system with word processing, telecommunications and calculator/clock functions, the vendor said.

■

LONDON — Dealers who guarantee the systems they sell are taking unreasonable risks, according to a high-tech insurance company here. Wigglesworth Insurance Ltd. has introduced a policy to cover dealers' maintenance contracts because it believes these dealers are "dabbling in insurance without reinsurance," resulting in an average of one dealer going into liquidation every week, a spokesman said.

FINLAND

HELSINKI — Digital Equipment Corp. is the first vendor to sell an integrated cluster solution here. DEC sold two VAX-11/785 systems, a collection of Microvax II machines, PDP-11/73 systems and its Ethernet communications network to Oy Kaukas Papermill to provide the company with production management, quality assurance, marketing and MIS capabilities.

The implementation, valued at $1.5 million, is slated for next January, according to a company spokesman. The paper manufacturer is located 10 miles from the Soviet border.

FRANCE

PARIS — Bull has signed a tentative agreement with Japan-based NEC Corp. that will reportedly enable the French group to extend the power of its DPS 7 line of medium-size processors with NEC equipment. The agreement calls for Bull to purchase NEC's Acos 750 CPU, which is said to be similar in architecture to that of the Bull machines.

Meanwhile, Bull announced five additions to its line of DPS 90 systems, similar in configuration to those recently announced by Honeywell Information Systems, Inc., Bull's U.S. affiliate. The Bull announcements include the following systems: a single processor, a dual processor, a fully redundant processor, a triple processor and a four-processor configuration.

■

PARIS — Gould, Inc. introduced a clustered computer configuration, called the SCI-Clone 32, during the recent International Aeronautical Exhibition here. The product, based on the vendor's SCI-Clone 32 line of superminicomputers, is intended for real-time and simulation applications, a spokesman said. It reportedly operates at 30 million instructions per sec., consists of a host and up to eight nodes, with each node composed of one to four CPUs.

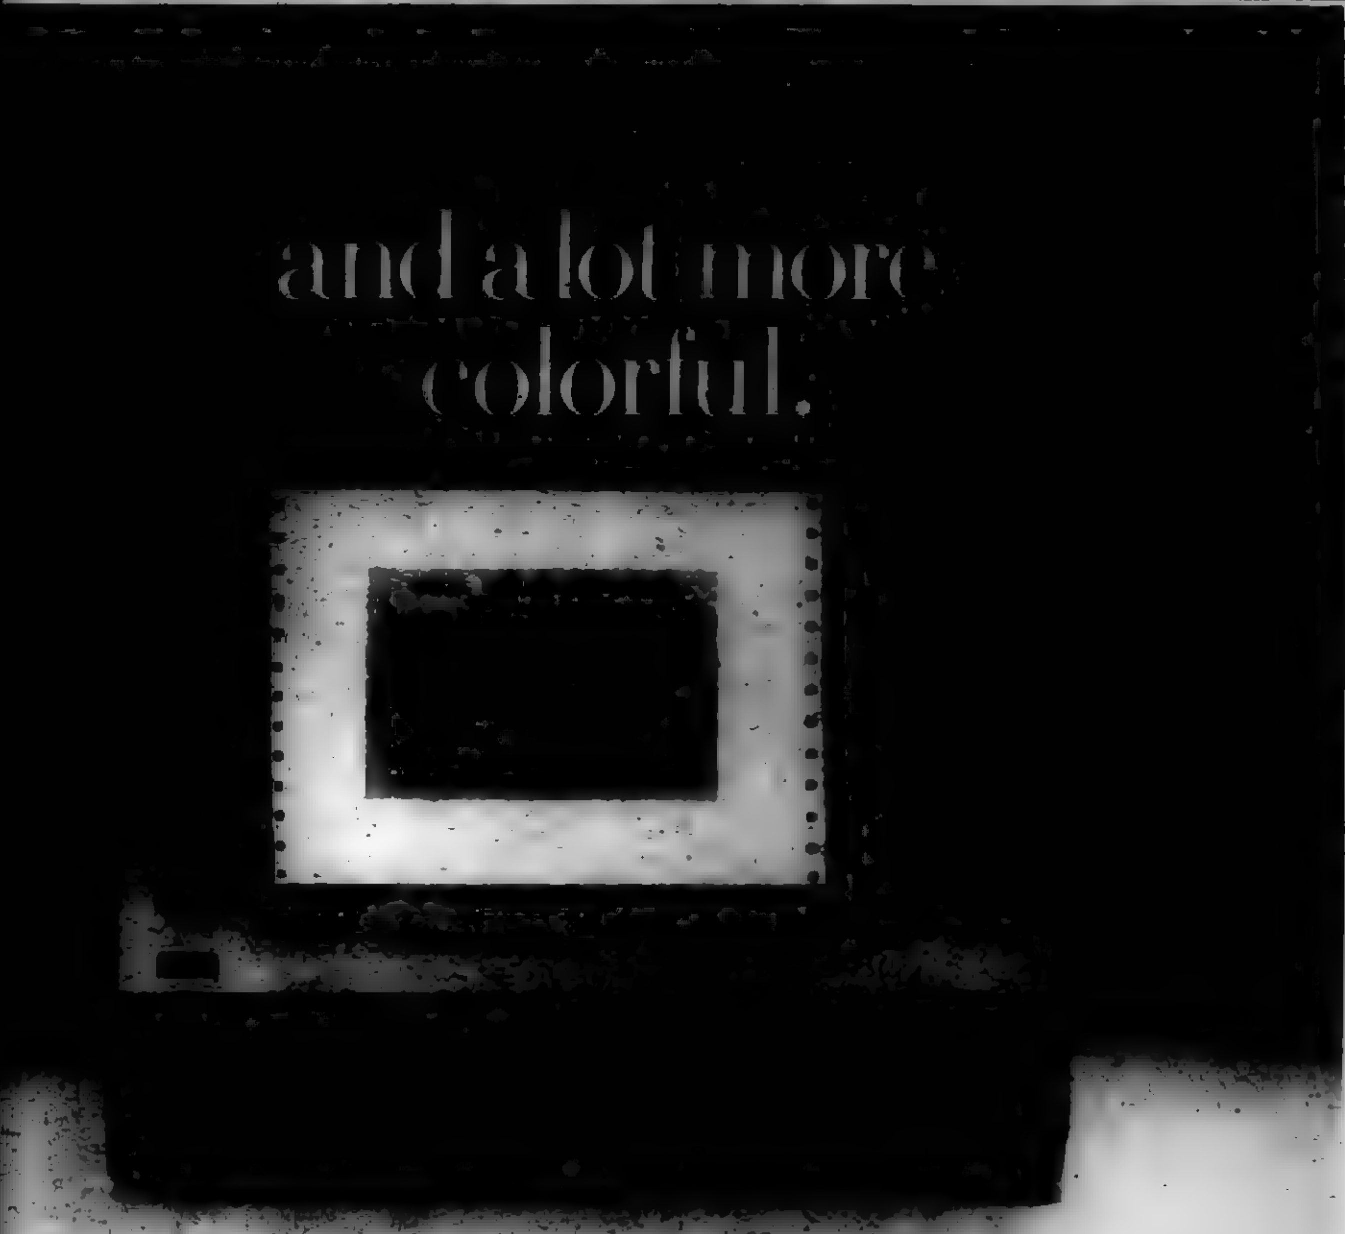
The network is connected via a communications bus working at 26M bit/sec., the vendor said. A basic configuration of the SCI-Clone 32 will cost about $150,000. The product will be announced in the U.S. at a later date, the vendor said.

JAPAN

TOKYO — IBM Japan and Computer Service Corp. (CSC), an independent software firm here, have established a company called Japan Information Engineering Company Ltd. The joint venture is expected to begin operations in October. IBM Japan, holding 35% of the company, will provide technical assistance in the design and construction of large-scale information systems. CSC will handle the bulk of applications development, a spokesman said.

NETHERLANDS

EINDHOVEN — Philips Information Systems, Inc. has acquired a division of the Computer Center of Limburg, a major Digital Equipment Corp. systems house here. In the recent takeover bid, Philips beat the large Dutch group Minihouse, one of the largest DEC systems houses in Europe, according to sources.



IBM Color Jetprinter

in color with more PC software than any other printer of its kind. It's all-points-addressable—which means that, with the proper software, there's no graphic pattern you can think of that it can't put down on paper. And the Color Jetprinter does near-letter-quality text, as well. In seven colors.

These are but two printers in IBM's family of personal printers. They all attach to IBM PCs—as well as to other leading personal computers. And they're all designed to serve a single purpose: To make your printing as effective as your processing. To give your work the finishing touch.

For the IBM Product Center or authorized dealer nearest you—or for a free brochure—call 1 800 IBM-2468, Ext. 90/KX.

Software saves ambulance firm from billing trauma

COVINA, Calif. — "Hurry up and wait" was the status quo at an ambulance service here until the firm automated its billing and collection procedures.

"Our job is to make sure our patients are transported as quickly as possible from the scene of an accident to the nearest hospital," said Jim Decker, president of Crippen Ambulance Service, Inc. But Crippen often had to wait months to get paid for its services.

"Being in the ambulance business, we can't control the types of patients that we pick up at the scene of an accident," Decker said. "We can't run a credit check to see if a patient has the ability to pay us — that's not our job."

The company answers about 1,500 ambulance calls a month and sends bills for its services to a variety of third-party insurance companies, to Medicare and Medicaid and to individual patients who have no insurance. The volume and variety caused record-keeping problems.

"It was extremely hard to track where all our money should have been coming from," Decker said. In addition, 40% of Crippen's billings went to Medicare, which sometimes took up to 60 days to turn around claims and to issue payments. Crippen installed two software packages, both from Lion Computers, to tackle its billing and collection problems.

In 1980, it installed Lion's Ambulance Billing and Collection System (ABCS), which Crippen helped the vendor put together. The system generates bills, based on coded information keyed into it from ambulance attendants' reports, and also produces reports that help Crippen track its billings and manage its business.

When an ambulance driver or attendant returns from a call, he fills out a worksheet that includes information such as the patient's name and address, his doctor's name, the type of medical service provided, the type of insurance the patient holds, the mileage on the call, whether the call was a night call that carries a surcharge and whether it was an emergency or not.

Employees in Crippen's billing department enter the information into a 196K-byte Data General Corp. Nova 3, where the ambulance call data is run against Crippen's service rates, which are maintained on the machine. The system then generates itemized bills for customers or their insurance agents.

ABCS also generates operational and revenue reports on demand that the company uses to help manage its business.

Operational reports break down information by different variables to show how efficiently the company is using its resources. Geographical reports, for example, show how many calls are made in the different areas Crippen serves. If two areas are near each other and one generates twice as many ambulance calls as the other, Crippen will shift each area's boundary to make the volume more equitable, according to John Wilson, the firm's general manager.

Revenue reports track the firm's profitability and help it adjust its rates. If one area consistently has a large number of customers who do not pay their bills, Crippen may choose either to stop serving the area or to raise its rates there. This way, Wilson said, "Those who do pay you make up for those who don't pay you."

Crippen installed its second software package in 1983 to help it recover Medicare payments as quickly as possible. The software, Lion's Electronic Billing, pro-

SERIES/1 EDUCATION
EDX AND CF

For the benefit of those users who are unable to attend the standard Series/1 courses provided by IBM, SSCP is now offering a complete curriculum of Event Driven Executive (EDX) and Communications Facility (CF) education. The classes are conducted at our education center, located in the San Francisco Bay Area. For the convenience of the larger user, we also provide onsite education at the customer's location.

SSCP offers:

- Curriculum prepared by former IBM Series/1 education specialist
- Small class size for individualized attention
- Courses ranging from basic operator training through advanced programming and systems internals workshops
- Hands-on labs designed to help your Series/1 staff reach a high level of EDX and CF expertise quickly
- Classes conducted at SSCP Education Center or at customer location
- Excellent availability
- Reasonable prices

Insurer uses electronic billing

Cuts claims load, turnover time

LOS ANGELES — For the insurance firm that administers Medicare monies in most of Southern California, electronic billing to health care providers like Crippen Ambulance Service, Inc. has eased the crunch between a staff shortage and a growing Medicare claims load.

"We can't hire enough [people] to keep up with the claims volume," said Stan Kirkham, Transamerica Occidental Life Insurance Co.'s manager of electronic media claims operations.

Transamerica's Medicare claims processing doubled in 1980, when the Medicare administration redrew the boundaries of the areas in which its carriers operated. Carriers like Transamerica are authorized to draw on a Medicare trust fund in order to pay health care providers in a given region for services they administer to Medicare recipients.

Since the redistricting in 1980, Transamerica's claims processing has increased 10% a year. Along with this, the U.S. Department of Health and Human Services' Health Care Financing Administration, which administers the Medicare program nationally, has cut back on money it provides carriers for Medicare processing. The cuts affect staffing levels.

Electronic billing helps Transamerica reconcile the gap between claims volume and its staff shortage by allowing individual staff members to handle more claims. Eight claims examiners can process 150,000 to 175,000 claims per month electronically, Kirkham said. With claims that come in on paper, the same monthly volume would require the services of between 45 and 50 examiners.

The insurance firm began to develop computerized processing for the health care providers it serves in 1979, when a mandate from the government directed it to do so. That mandate said insurance firms that administer Medicare money to physicians, clinics, ambulance companies and other health care providers had to computerize their operations.

Transamerica responded with a two-pronged approach: First it offered automated claims processing by magnetic tape, then it opened up the service to health care providers who had telecom-

OF THE BIG THREE IN BUSINESS SOFTWARE, WHO'S THE REAL NUMBER ONE?

If you know corporate software, you know that only three companies are really capable of offering a "total solution" product line. Everything from general ledger to a PC link with your mainframe.

And if your company's sales are $100 million or more, the amount you're likely to invest in corporate software is of such magnitude you undoubtedly should talk to all three.

Not only will you become a more informed buyer, but a more satisfied owner after you buy.

Our recommendation to shop the big three is offered with confidence. And with certainty that once a competitive evaluation ensues, the chance of your choosing McCormack & Dodge easily exceeds one in three. Because, not long after you begin your analysis, the differences will become apparent. Differences in what each company actually means when it claims to have a total software solution, and a totally integrated software line.

We believe your evaluation will show you this:

Two companies offer the mere appearance of integration. An agglomeration of business applications linked superficially. Through a web of hinges, patches, bridges, shadow files and masks lurking just below the surface.

While one offers the real thing. Millennium. A true family of systems in which the whole works as smoothly as any part. In which every package has the same query mechanism, the same report writers, the same screen generation, the same on-line documentation, security and real-time capabilities. So that when the packages are put together, there are absolutely no borders between them. They fit like pieces in a jigsaw puzzle. Making the most efficient use of all your data processing resources. There's even a Millennium application development tool, so you can create new systems as you need them. Without slow, expensive programming.

Millennium means integration in fact. Not just in name. And it is available only from McCormack & Dodge.

Of the big three in software, who's really number one?

Don't stop asking until you know.

McCORMACK & DODGE

INTRODUCING THE HEWLETT-PACKARD TOUCHSCREEN II

OFFICE AUTOMATION MADE EASY. POINT BY POINT.

The new Hewlett-Packard *Touchscreen II* personal computer is the mainstay of an office automation system designed to be easy.

Easy to learn ■ Easy to operate ■ Easy to place in an office information network.

In short, *Touchscreen II* makes it easy to be productive ■ Here are a few pointers.

WHEN YOU SEE WHAT YOU WANT, POINT.

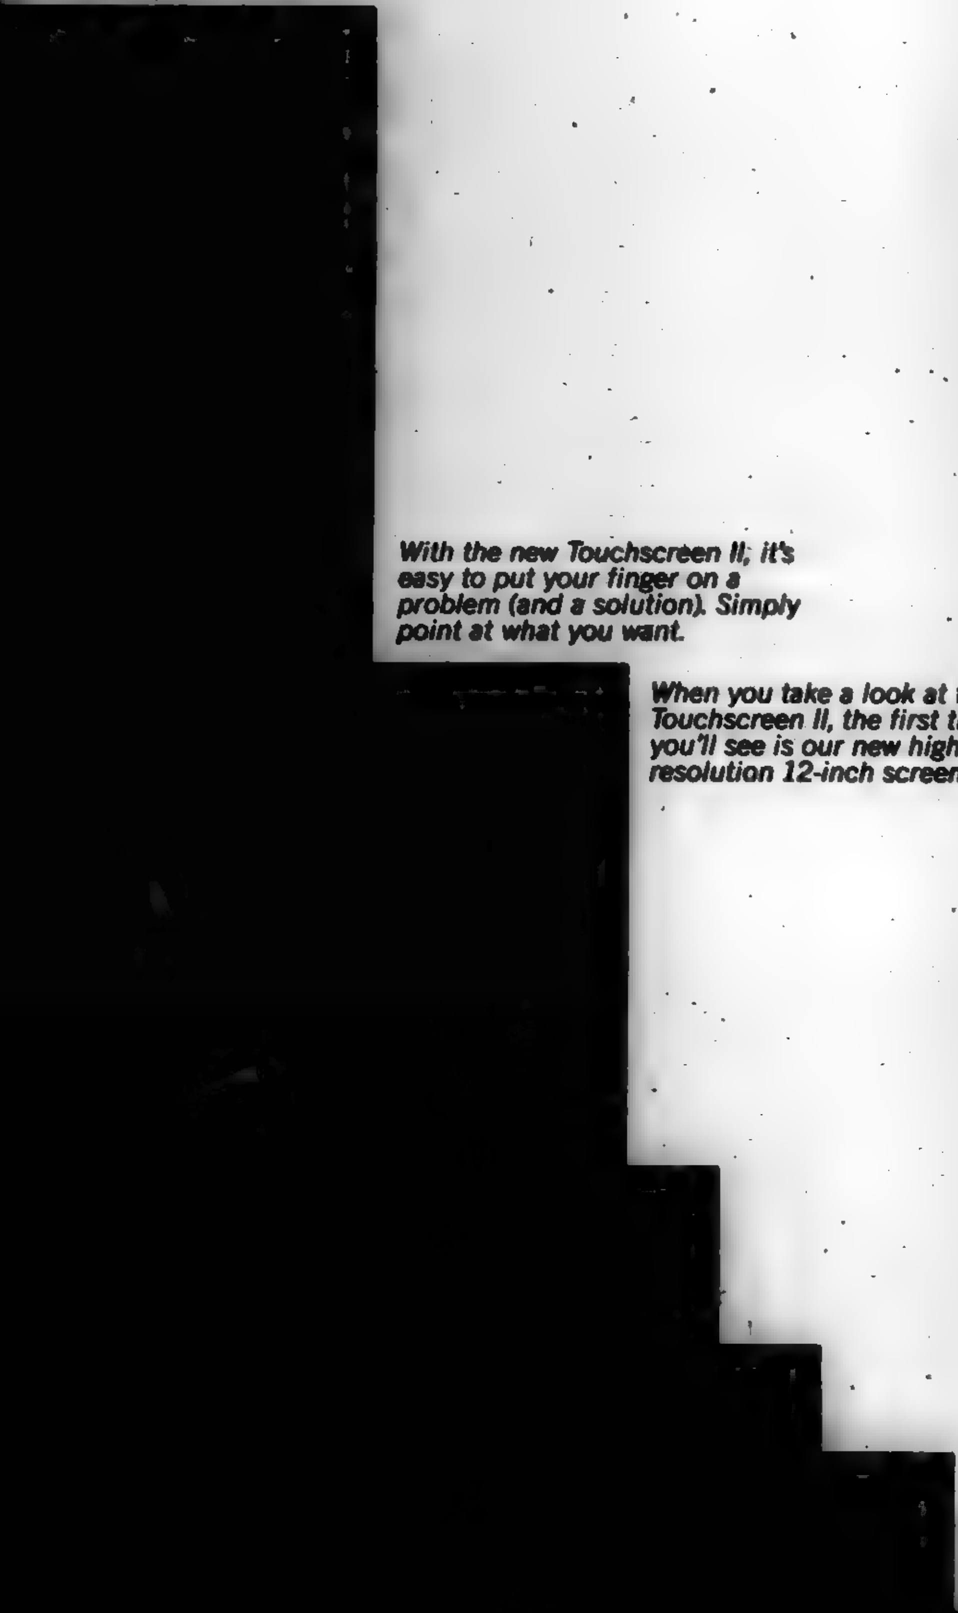
Sit down to work, and *Touchscreen II* displays a selection of application software on a high-resolution 12-inch screen.

Find the one you want to use, then touch the point on the screen where it appears ■ Instantly, the program is activated.

You're freed from typing complicated gibberish commands ■ Simply look, touch, and move on.

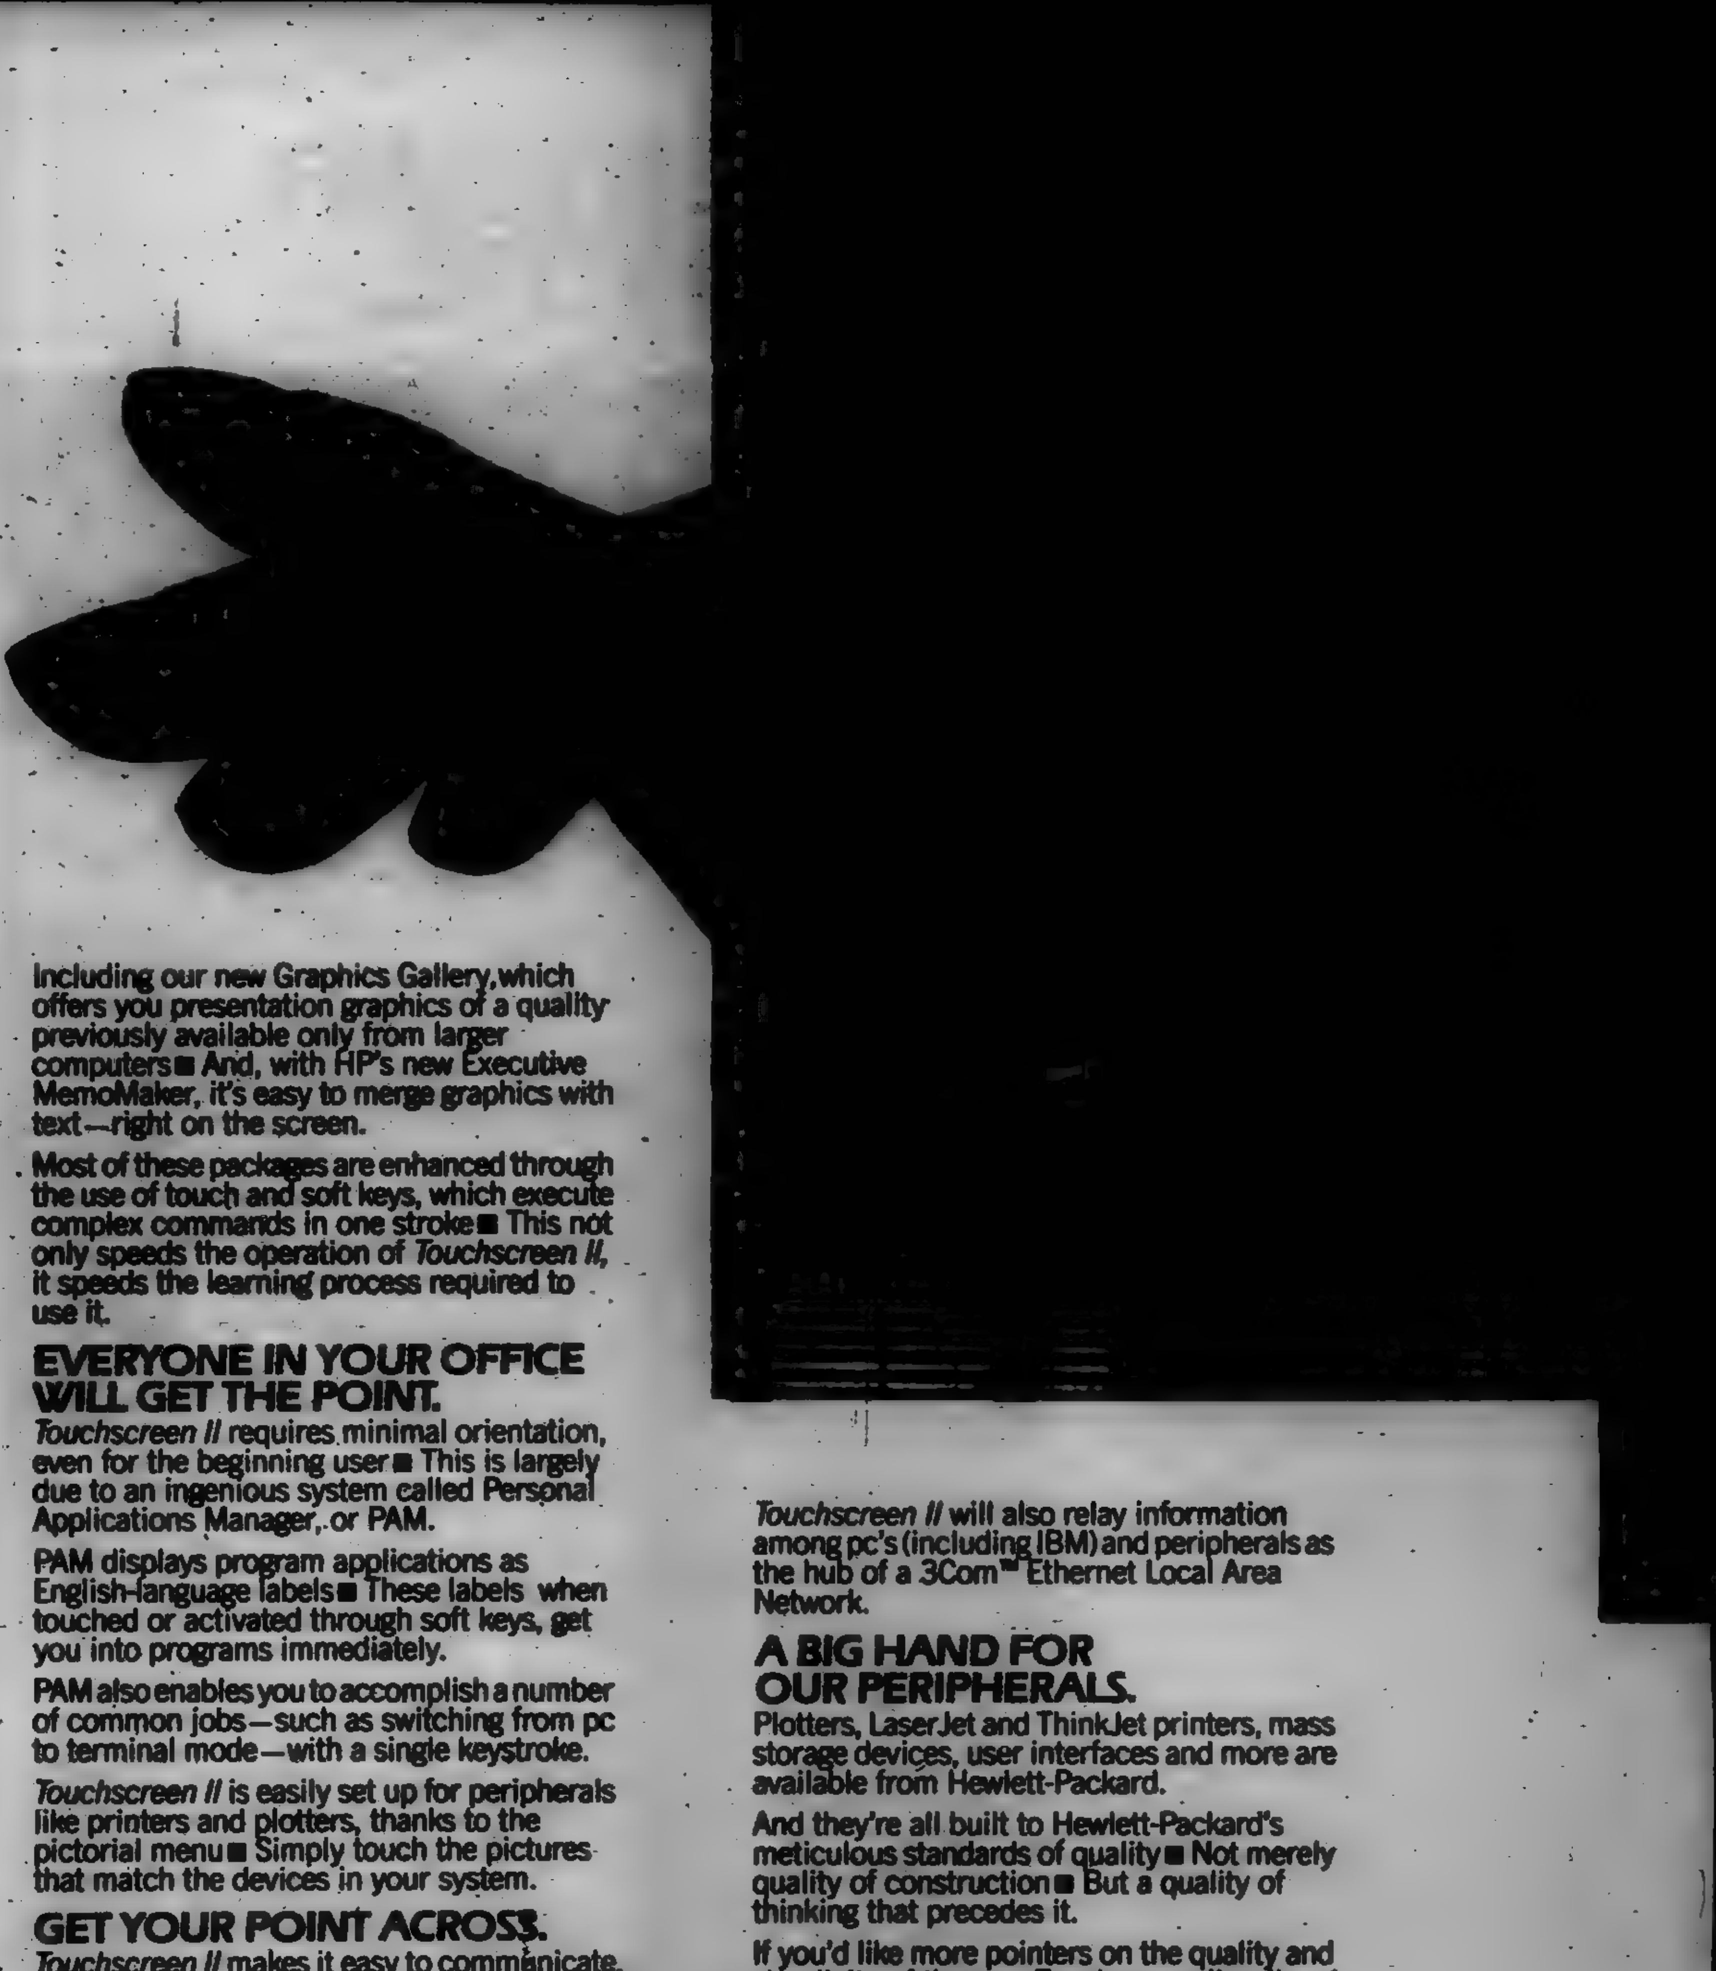
THERE'S PLENTY TO POINT TO.

Touchscreen II allows you to choose from over 600 of the most popular business software packages ■ In addition, you can use Hewlett-Packard's own software library ■



With the new Touchscreen II, it's easy to put your finger on a problem (and a solution). Simply point at what you want.

When you take a look at the Touchscreen II, the first thing you'll see is our new high-resolution 12-inch screen.



Including our new Graphics Gallery, which offers you presentation graphics of a quality previously available only from larger computers ■ And, with HP's new Executive MemoMaker, it's easy to merge graphics with text—right on the screen.

Most of these packages are enhanced through the use of touch and soft keys, which execute complex commands in one stroke ■ This not only speeds the operation of *Touchscreen II*, it speeds the learning process required to use it.

EVERYONE IN YOUR OFFICE WILL GET THE POINT.

Touchscreen II requires minimal orientation, even for the beginning user ■ This is largely due to an ingenious system called Personal Applications Manager, or PAM.

PAM displays program applications as English-language labels ■ These labels when touched or activated through soft keys, get you into programs immediately.

PAM also enables you to accomplish a number of common jobs—such as switching from pc to terminal mode—with a single keystroke.

Touchscreen II is easily set up for peripherals like printers and plotters, thanks to the pictorial menu ■ Simply touch the pictures that match the devices in your system.

GET YOUR POINT ACROSS.

Touchscreen II makes it easy to communicate.

Built-in terminal capabilities and a variety of data communication devices allow *Touchscreen II* to exchange information with Hewlett-Packard, DEC and IBM host computers ■ Acting as a terminal, *Touchscreen II* enables you to tap into the power of these larger computers, making use of their software, databases and peripherals.

Touchscreen II will also relay information among pc's (including IBM) and peripherals as the hub of a 3Com™ Ethernet Local Area Network.

A BIG HAND FOR OUR PERIPHERALS.

Plotters, LaserJet and ThinkJet printers, mass storage devices, user interfaces and more are available from Hewlett-Packard.

And they're all built to Hewlett-Packard's meticulous standards of quality ■ Not merely quality of construction ■ But a quality of thinking that precedes it.

If you'd like more pointers on the quality and simplicity of the new *Touchscreen II*, call us toll-free at 1-800-FOR-HPPC, Dept. 282A, for the name of your nearest Hewlett-Packard dealer or sales office.

The more you simplify, the more you'll produce ■ And productivity is, after all, the point of this discussion.

3Com™ is a U.S. trademark of 3Com Corporation.

HEWLETT
PACKARD

WE JUST TOPPED THE LONGEST RUNNING LINE OF PRINTERS.

The new 5300 family of printers from Teletype Corporation represents an exceptional value. The entire family combines our traditional reliability with a 200 cps speed that is ideal for business applications. You can choose a keyboard or auxiliary printer, both of which are available in 15-inch tabletop and 9½-inch compact sizes.

From the moment you take a 5300 out of the box and plug it into your system, you'll be amazed at how easy it is to operate. To begin with, you can downline load or simply push a button on the printer's control panel to set options. And just push another button to select an alternate option set for a different system. A 4-character LCD on the control panel provides all of the status indicators you need.

The 5300 is available with a built-in 300/1200 baud modem that saves desk space and makes it possible to perform all dialing and logon functions. So you can access a CPU or timesharing network by simply depressing a key on the detached keyboard.

For printing versatility, the 5300 is hard to beat. It features graphics capabilities as well as emphasized, expanded and compressed printing.

You'll also appreciate the forms handling of the 5300. It is available with adjustable push or pull tractors, a roll paper holder, a supply rack and an accumulator.

Other features that make the 5300 an even better value include an interchangeable platen, acoustic adapter, a carrying case for the 9½-inch model and self-diagnostic capabilities.

So if you'd like a printer that tops what you have now, check out the latest in our long-running line. Write Teletype Corporation, 5555 Touhy Avenue, Dept. 3223-F, Skokie, IL 60077. Or call 1-800 323-1229, Extension 701.

TELETYPE: VALUE SETS US APART.

CLAIMS

from page 26

munications capabilities.

In 1980, Transamerica developed a format for automated claims processing that met guidelines Medicare had established for its program. The firm then began talking with doctors about its plans to automate its processing with magnetic tape. "We had to allow information to filter into the medical community that this was the way we were headed," Kirkham said.

He sent questionnaires to the doctors and to service bureaus, which at the time provided most doctors' data processing. The forms asked the recipients what kind of computer capabilities they had, and Transamerica used the answers to set up its system.

The information helped Transamerica fit its system to doctors' needs. "If they had to buy a new system to process claims electronically, it wasn't worth it," Kirkham said. The firm had planned to use tape with a 6,250 bit/in. density, for example, but found that 1,600 bit/in. tape was what most doctors used. It changed its plans and went with the 1,600 bit/in. tape.

Transamerica brought its magnetic tape claims processing up on an IBM 3081 in November 1981. At first, only one service bureau agreed to sign on. "No one was willing to venture forth into an unknown venture at that point," Kirkham said.

Once the system proved reliable, more organizations started using it. Today, 44 service bureaus send health care providers' Medicare claims to Transamerica either on magnetic tape or over telephone lines. Some providers bypass the service bureaus and deal directly with Transamerica.

In 1982, Transamerica began offering electronic claims processing via telecommunications. As it did during its venture into magnetic tape processing, the firm asked doctors what kind of equipment they had in order to find out how to set up its system.

Data transmitted at different speeds

Because doctors transmitted their data at different speeds, for example, Transamerica set up its claims processing to accept information coming in at 1,200, 2,400 and 4.8K bit/sec. Now, Kirkham said, "We can deal with anyone who's capable of telecommunicating the data to us."

Users send their data to the insurance firm through modems over voice-grade telephone lines. The data enters a Datapoint 8800 at Transamerica, which massages it and passes it to the 3081 for processing.

To be accepted as participants in either the magnetic or the telecommunications claims processing services, users must propose the software they plan to use to record their claims to Transamerica. The insurance firm has authorized 22 vendors' software packages for use with its system, Kirkham said. Some large clinics and other health care providers that have programmers in-house have also had programs accepted.

The electronic setups allow Transamerica to turn claims around in seven to 10 days, as opposed to an average 15- to 30-day cycle the firm needs to process paper claims, Kirkham said. Of the 26,000 health care providers who file Medicare claims with the insurance firm, approximately 3,500 make use of electronic processing.

TRACK

from page 26

vided a setup through which Crippen could send its Medicare claims and receive payment electronically rather than manually.

The firm uses the software to prepare its claims according to Medicare's electronic billing guidelines. Data from the claims is captured on magnetic tape.

Each week, Crippen sends a claims tape by courier to Transamerica Occidental Life Insurance Co., which pays out Medicare monies to ambulance services, doctors and other health care providers in Southern California.

Payments received more quickly

Transamerica offers computerized claims processing as a means for health care providers to receive Medicare payments more quickly than they would if they used paper forms.

The firm runs Crippen's tapes on its own machine, which generates payments and a magnetic tape record of those payments.

Sending claims on tape rather than paper has cut the time Crippen must wait for Medicare payments from between one and two months to seven days, Wilson said. "What I bill this week, I will get paid for next week, he said."

Courier drops off tape, picks up checks

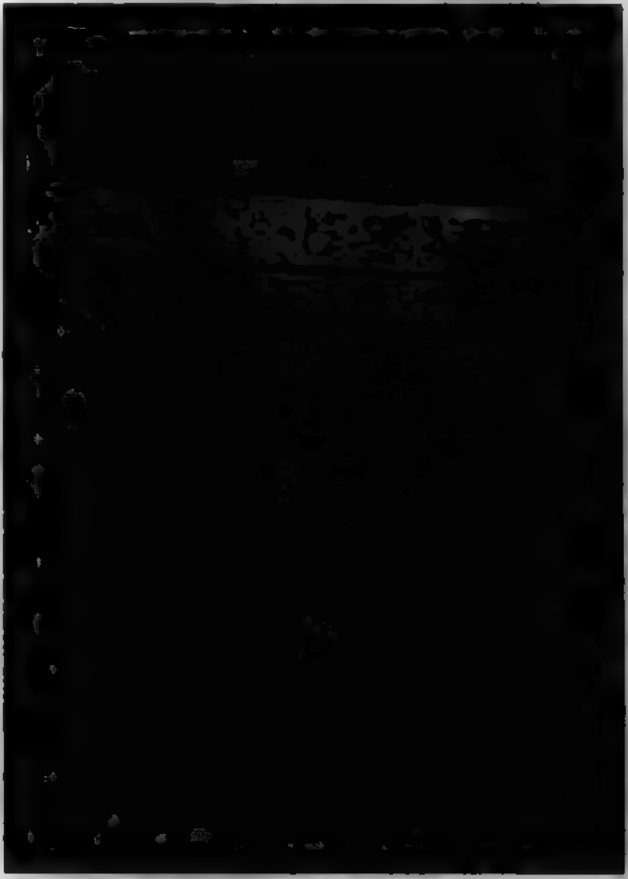
When Crippen's courier drops off one week's tape, he picks up checks generated from the last week's tape along with a tape on which Transamerica has recorded the amounts it has paid on each claim.

The ambulance service then runs this tape on its DG minicomputer. The data from the tape distributes payments to client records and updates the firm's accounts receivable files. Wilson said the payment tape runs in about 20 minutes, whereas manual posting would take between four and six hours.

Medi-Cal, California's Medicaid service, recently began offering computerized services similar to those Transamerica Occidental provides for Medicare, but Wilson said that Crippen's Medicaid volume is too low to justify investing in automated processing.

The only additional automation the firm anticipates during the near future is a point-of-sale system, scheduled to be up and running soon in a medical equipment shop that Crippen operates, according to Wilson.

DeREX HAS THE LINEWRITER SERIES.
AND THE EXPERTISE TO MAKE IT WORK FOR YOU.
AT VERY SUBSTANTIAL SAVINGS.



The Linewriter (400/800 lines per minute) is the latest state-of-the-art field-proven band printer. It offers unmatched print quality with long-life ribbon and reliability, as well as the best performance on the market. And at 55dba, it's also the quietest in the industry.

The fact is, DeRex has the *right* printer system to fit *your* computer system, be it IBM, Wang, HP, DEC, Burroughs or just about any name you can think of.

More than that, DeRex has the expertise to insure that their highest-quality, correct field-proven printers will be 100% compatible with your particular printer needs. With the best prices, technical support and nationwide service available, as a growing list of satisfied customers will attest.

Call or write Jim Rule and Jim Ross today. An put their experienced team to work for you. Right away.

"So you think Infinet's remote dial back-up capability is great. Well, guess whose idea it was."

L A Nelson

Lynn Nelson
Network Operations Manager
Contel Network, Inc.

The data communications people at Contel feel they deserve some credit for our new EMS-II Network Control System.

And, quite frankly, they do.

At Infinet, it's our policy to work closely with our customers to develop the kind of network capabilities that best meet their needs. We think it's a good policy. And our new EMS-II is a good example of how well it works.

We spoke with Contel while we were developing the EMS-II. We wanted to know what they needed most in a network control system.

Contel operates one of the largest multipurpose X.25 networks in the world, a network that is vital to Contel's $4 billion business.

Because they can't afford to wait until a line problem is fixed, Contel asked for one thing more than any other: an automatic dial back-up capability to maintain communications between hub and remote sites—no matter what happens to a line.

At Infinet, we know a good idea when we hear it, so we developed this feature for our EMS-II Network Control System.

It works so well, Contel's users are often not even aware when they're on dial back-up.

And network restoral isn't all the EMS-II can do.

It lets you monitor, test and reconfigure your entire network. Digital or analog. From one central site. Plus it can be integrated with network management and performance measurement into a single data base.

So, if you want to thank someone for the EMS-II's extensive network control capabilities, thank Contel, too.

For more information on our EMS-II or on any of our other network management products, call Infinet toll-free at **800-343-0684.** (In Massachusetts call toll-free **800-322-1238.**) Ask for extension 5200.

Micro-to-mini link saves building firm $3,300 a month

EVANSVILLE, Ind. — Traylor Brothers, Inc., an international construction firm headquartered here, is now using a micro-to-minicomputer link in its efforts to attack high communications costs and low productivity rates.

Installing IBM Personal Computers in three of its construction site field offices has saved Traylor $3,300 a month in telecommunications bills, according to Charles H. Sparrenberger Jr., Traylor's DP manager. The micros link up to the IBM System/34 at corporate headquarters here via AST Research, Inc. 3780 synchronous communications cards and Racal-Vadic, Inc. Autodial VA212 modems.

At Traylor construction sites in Louisiana, Utah and Kentucky, IBM Personal Computers and Epson America, Inc. FX100 printers replaced permanently on-line dumb IBM Model 12 terminals. Traylor Brothers developed software in Basic for the Personal Computer to allow entry of payroll and accounts payable transactions and also to allow printing of payroll checks and associated edit reports, Sparrenberger said.

The company went to a manual-call manual-answer communications system to allow file transfer between the minis and microcomputers, according to Sparrenberger.

Saving $3,300 a month

Because Traylor field users only need to access the System/34 when entering or calling up data, on-line time and its resulting communications cost has been cut by 90%, according to Sparrenberger. "We save roughly $3,300 a month," Sparrenberger said. "So I've done all right."

Traylor was one of the System/34's first customers, having purchased it in the summer of 1978. On the mini, IBM's construction software package, Cmas, is used as the nucleus of the accounting system.

Traylor Brothers has developed numerous packages in-house for equipment costing and billing, estimating and insurance management. Several of the Cmas programs have been modified in the areas of data entry and management reporting to give the company data in a custom format. "We [Sparrenberger and another DP employee] wrote reports based on Cmas' files and bells and whistles," Sparrenberger said.

The decision to choose the IBM Personal Computer essentially grew out of Sparrenberger's satisfaction with his initial Personal Computer experience.

"We had bought one for the Evansville office in the fall of 1982 and were exploring ways we might use it in the business," Sparrenberger said. "We came up with this idea to replace our on-line terminal system."

In addition to lower communications costs, the micros give Traylor's remote site employees the opportunity to enhance local productivity with microcomputer software programs. The project manager in Duchesne, Utah, for example, purchased Microsoft Corp. Microsoft Project to manage better the construction of an 8½-mile irrigation viaduct tunnel for the U.S. Bureau of Land Reclamation.

"The micro helps him keep track of what's left to do on the project, scheduling and target dates," Sparrenberger said. "That's productivity."

At Traylor's permanent southern marine division office in Baton Rouge, La., employees use Peachtree Software, Inc. Peachtext word processing software to compose and print subcontractor application forms and paychecks.

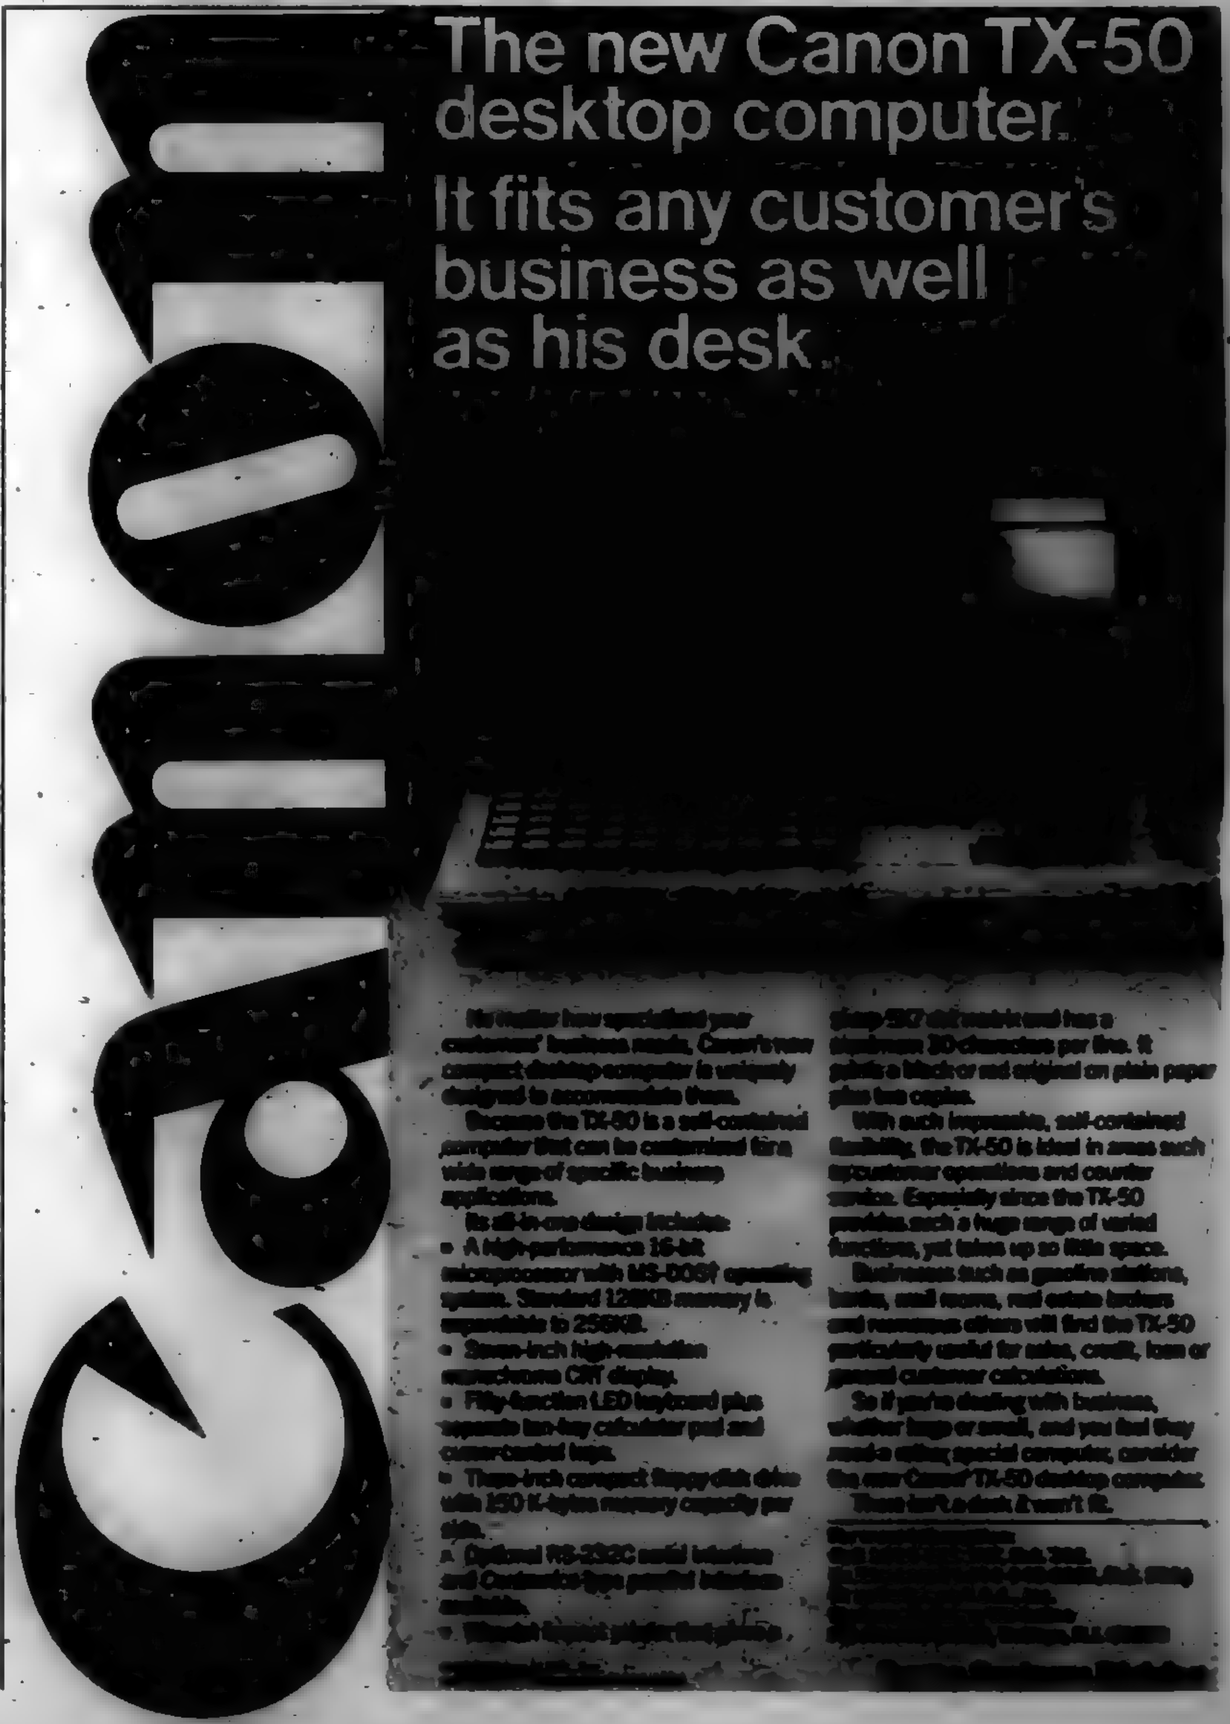
Renee Muir, a computer operator in Baton Rouge, said the Personal Computer-System/34 link allows her to interact with accounts receivable and payroll information stored on the mini at headquarters here. "I can do much more now," she said. "I can get into the memory and make necessary changes where I couldn't before. I'm only human — I do make errors — and when I can get in and change them right away, I'm happy."

Sparrenberger said the micros ease demand on the mini's CPU, because resources of the System/34 are not being taxed by data entry being done in a field office. And the field offices' processing time is not dictated by the time schedule of the office here. For example, Utah is one hour behind the office here, and site employees at Traylor's dam project in Greenup, Ky., are one hour ahead. When the office here shuts down at 4:30 p.m. CST, the Utah office is able to process until closing time in that time zone.

"Basically, our two goals for the Personal Computers were to cut communications costs and to keep the same amount of interactive editing available in the field offices that we had before," Sparrenberger said. "We've accomplished both."

The Personal Computer used in Kentucky was formerly used on a Traylor sewer project in Anchorage, Alaska. Sparrenberger said he will not hesitate to transport any existing micro to a future construction site office or to purchase a new unit for the location.

"In the past, we had to call AT&T to install special connections for the terminals when we set up a new field office," he said. "Now we can just take the [Personal Computer] to the office and plug it right in."



The new Canon TX-50 desktop computer.
It fits any customer's business as well as his desk.

No matter how specialized your customers' business needs, Canon's new compact desktop computer is uniquely designed to accommodate them.

Because the TX-50 is a self-contained computer that can be customized for a wide range of specific business applications.

Its all-in-one design includes:
- A high-performance 16-bit microprocessor with MS-DOS† operating system. Standard 128KB memory is expandable to 256KB.
- Seven-inch high-resolution monochrome CRT display.
- Fifty-function LED keyboard plus separate ten-key calculator pad and cursor-control keys.
- Three-inch compact floppy disk drive with 150 K-bytes memory capacity per side.
- Optional RS-232C serial interface and Centronics-type parallel interface available.
- [illegible] impact printer that prints a [illegible] 5x7 dot matrix and has a maximum 30-characters per line. It prints a black or red original on plain paper plus two copies.

With such impressive, self-contained flexibility, the TX-50 is ideal in areas such as customer operations and counter service. Especially since the TX-50 provides such a huge range of varied functions, yet takes up so little space.

Businesses such as gasoline stations, banks, mail rooms, real estate brokers and numerous others will find the TX-50 particularly useful for sales, credit, loan or general customer calculations.

So if you're dealing with business, whether large or small, and you feel they need a rather special computer, consider the new Canon® TX-50 desktop computer.

There isn't a desk it won't fit.

[illegible]

COMPUTER
FAT.

HOW TO AVOID IT, FROM THE LEADER
IN ON-LINE TRANSACTION PROCESSING.

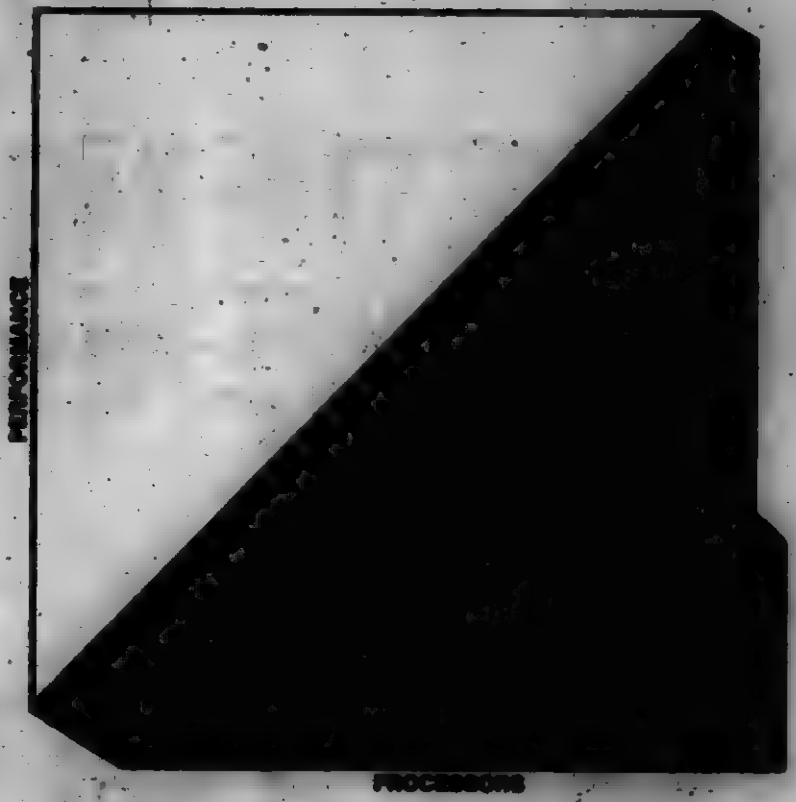
WHAT COMPUTER FAT IS.

Computer fat is created when you buy more computer than you need. With conventional computer architecture, you have no other choice. You buy the closest fit available and "grow into it."

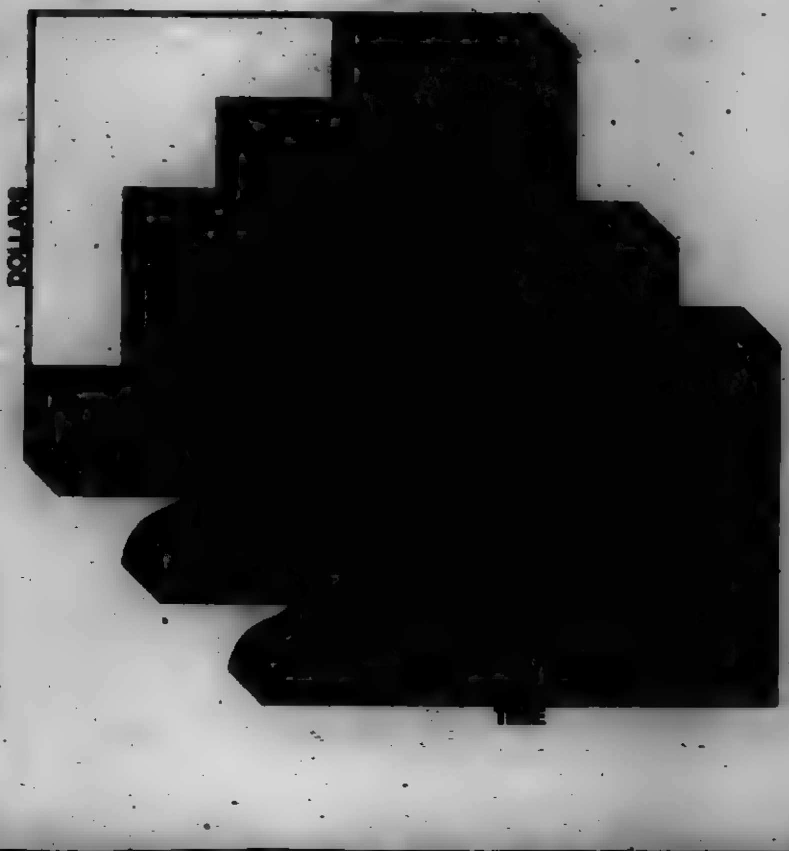
So there is always waste and inefficiency. And you pay dearly for it.

WHAT IT COSTS.

The performance cost. With conventional computer architecture, doubling your processors does not double your performance. With Tandem, each incremental increase in processing power provides matching performance.



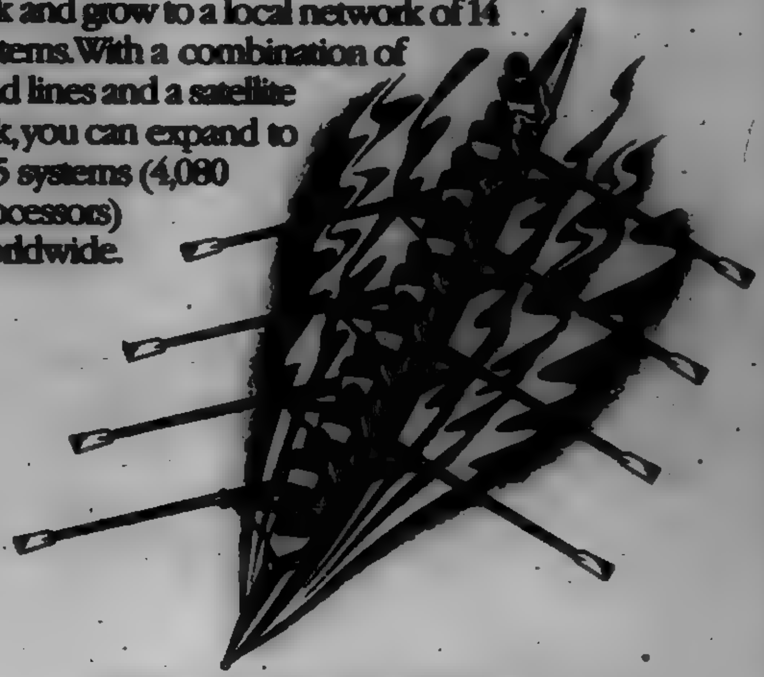
The dollar cost. With conventional computer architecture, growth is convulsive. You must continually over-invest to assure sufficient processing power. With Tandem, growth matches need. You never invest more than you have to.



TANDEM'S NON-FAT ARCHITECTURE.

Tandem Computers has developed the ultimate system for on-line transaction processing. It is the fault-tolerant system that can grow as your needs grow, expanding at any increment you choose.

You can start with two processors and grow to 16 processors in a system. You can put in a fiber-optic link and grow to a local network of 14 systems. With a combination of land lines and a satellite link, you can expand to 255 systems (4,080 processors) worldwide.



In a Tandem system, there are no idle backup components. They all share the workload.

With Tandem, your software expands, too. All systems work like one system, and you'll never have to rewrite a line of applications code.

The Tandem NonStop™ system is also enhanced by a high-performance, relational data base that can be geographically distributed to wherever it's needed. And no single component failure can shut you down.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the U.S. Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

TANDEM COMPUTERS

CALL FOR PAPERS

SIR/DBMS' SECOND ANNUAL CONFERENCE
Chicago, Oct. 20-22

Papers are now being sought for this second annual conference. Special interest groups and panel discussions of where current hardware trends are leading the industry are scheduled for the conference. For more information about the conference or to submit an abstract, contact Judy Eftekhar, Director of Communications, Sir, Inc., 5215 Old Orchard Road, Skokie, Ill. 60077; or Dave Hall, Chairman, Users Group Board of Governors, Florida International University, Serdac/PC 549, Tamiami Campus, Miami, Fla. 33199.

INFORMATION SYSTEMS ASSESSMENT
Noordwijkerhout, The Netherlands, August 27-29, 1986

A call for papers has been issued by the conference chair. Possible issues to be addressed are scientific foundations for information systems assessment; methodologies for information systems assessment (methods, techniques and procedures); relevant dimensions of information systems assessment, measurement problems for information systems assessment performance; stakeholders and interest groups in information systems assessment; evidence of information systems benefits and evaluation criteria for implementation success; and present standards and practice (state of the art) for information systems assessment.

Letters of intent (due July 1), full papers (due Nov. 15) and requests for information should be addressed to Niels Bjorn-Anderson, Program Committee Chairman, Institute of Informatics and Management Accounting, 60 Howitzve, DK 2000 Copenhagen F, Denmark.

COMPUTER GRAPHICS '86
Anaheim, Calif., May 11-15, 1986

A call for papers has been issued by the National Computer Graphics Association (NCGA) for their seventh annual conference and exposition. Tutorials and technical sessions at the conference will focus on the application of computer graphics to a wide variety of business and industry situations. Individuals interested in proposing a tutorial or technical paper for Computer Graphics '86 should contact the NCGA for a copy of the official call for papers brochure. Abstracts are due to the NCGA no later than Sept. 15. For information and copies of the brochure, contact the Education Coordinator, NCGA, Suite 200, 2722 Merrilee Drive, Fairfax, Va. 22031.

THE 16TH CONFERENCE ON COMPUTER AUDIT, CONTROL AND SECURITY
Fort Worth, Texas, April 28 to May 2, 1986

A call for abstracts has been issued for this 16th annual conference. Examples of subjects of interest are networks and data communications; audit, control and security of user-developed systems; information security in advanced environments; coping with microcomputer proliferation; auditing on-line systems; detecting fraud in computer systems; advanced DP audit techniques; controlling office information systems; auditing in a data base environment; getting the most out of DP audit resources; measuring the effectiveness of controls; experience with computer security products; and technology updates.

No written paper is required for this meeting.

Send at least a one-page abstract of what you propose to present and a brief biography. Abstracts and biographies must be received no later than Sept. 20. Send abstract to the Program Chair, EDP Auditors Foundation, 373 S. Schmale Road, Carol Stream, Ill. 60188.

1986 INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS, INC. CONFERENCE ON ROBOTICS AND AUTOMATION
San Francisco, April 14-17, 1986

Papers are solicited in all areas of robotics and automation, including flexible manufacturing, materials handling, scheduling and control, system design and control, modeling and simulation and economic evaluation. Papers describing novel theory and/or applications are invited.

Four copies of papers, 15-20 double-spaced pages, should be sent by Oct. 1 to Rajan Suri, University of Wisconsin at Madison, Department of Industrial Engineering, 1513 University Ave., Madison, Wis. 53706. Further information is available from Robotics and Automation, c/o Harry Hayman, 736 Whitaker Terr., Silver Spring, Md. 20901.

INTERNATIONAL FEDERATION FOR INFORMATION PROCESSING (IFIP) CONGRESS '86: THE 10TH WORLD COMPUTER CONGRESS
Dublin, Sept. 1-5, 1986

Papers are now being sought for this congress. All submitted papers should concentrate on addressing a wide class of real-world problems; relating different, alternative or complementary approaches to design and development; filling gaps between different fields; and explaining to the interest groups the rationale of the approaches taken.

Five copies of each paper should be submitted to the Congress Secretariat, Ifip Congress '86, 44 Northumberland Road, Dublin 4, Ireland. The submission deadline is Nov. 1.

PRESENTING THE MOS
THAT EVER HAPPENED

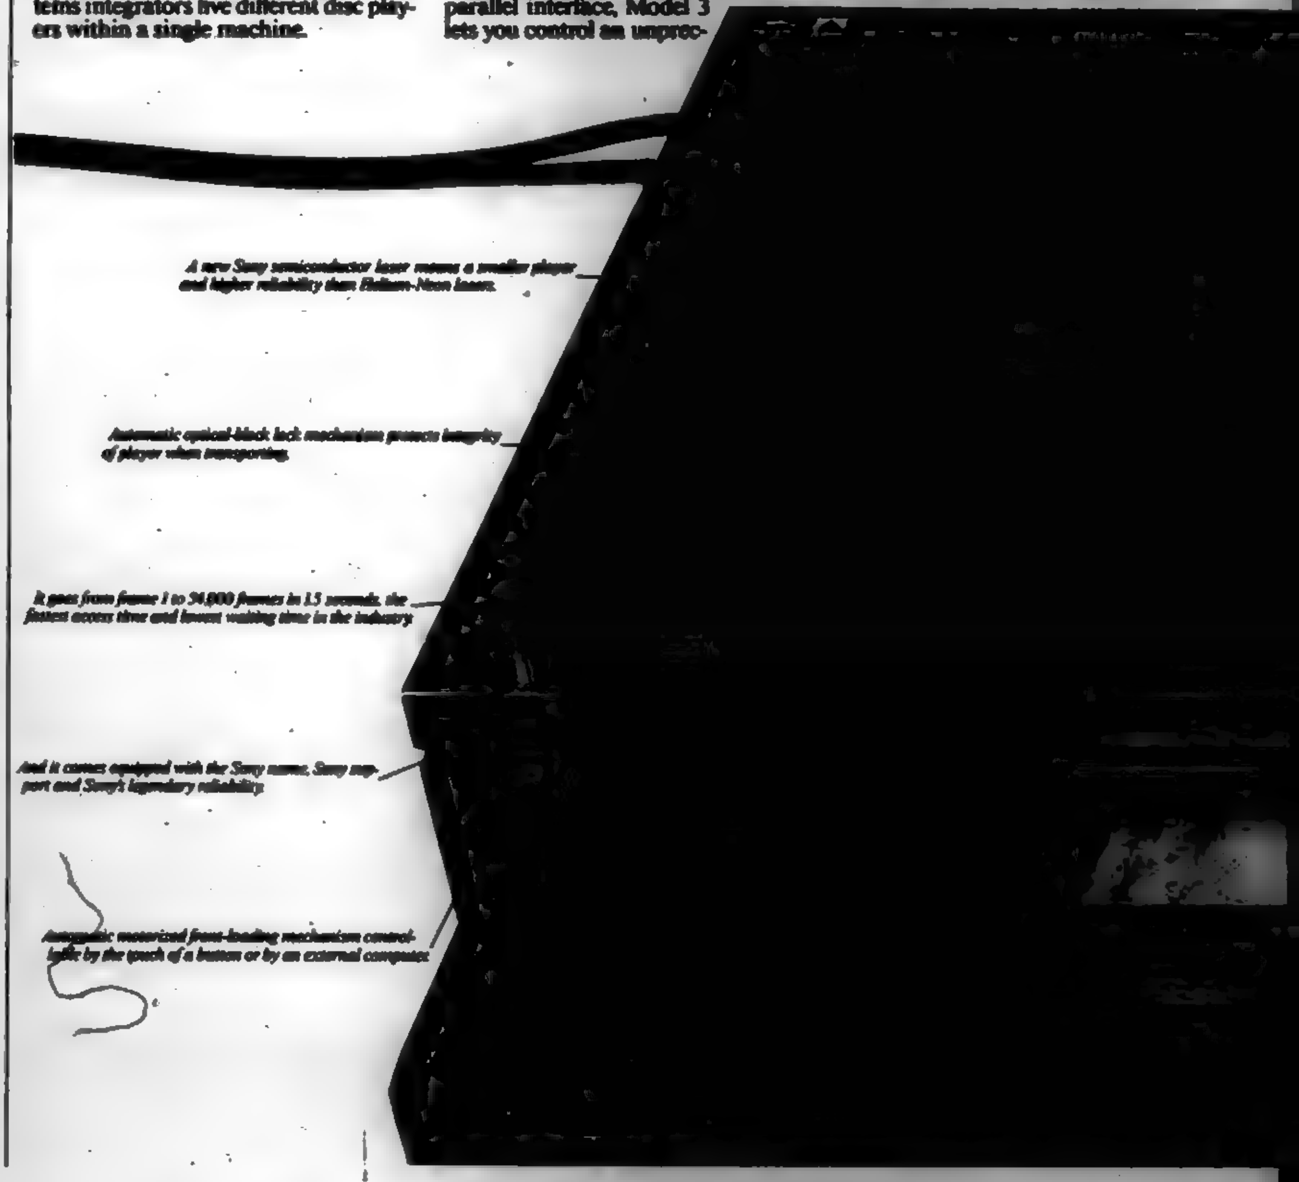
INTRODUCING THE LDP-2000 SYSTEM VIDEO DISC PLAYERS.

In one masterful stroke, Sony has just raised its Intelligent Video™ systems from smart all the way to genius.

We created the LDP-2000, a player for standard LaserVision discs that's so advanced and so flexible, it gives systems integrators five different disc players within a single machine.

Model 1 provides random access audio/video with an RS-232C external computer interface. Add an expansion board, and Model 2 gives you the ability to play discs with audio-track control programs. While if you add a parallel interface, Model 3 lets you control an unprecedented 15 players through one communications bus.

With Model 4, you're equipped with the perfect educational tool: Still Frame Audio. It compresses digital audio so you can extend a program to an



A new Sony semiconductor laser means a smaller player and higher reliability than Helium-Neon lasers.
Automatic optical-block lock mechanism protects integrity of player when transporting.
It goes from frame 1 to 54,000 frames in 1.5 seconds, the fastest access time and lowest waiting time in the industry.
And it comes equipped with the Sony name, Sony support and Sony's legendary reliability.
Automatic motorized front-loading mechanism controllable by the touch of a button or by an external computer.

T INTELLIGENT THING
TO INTELLIGENT VIDEO.

incredible 15 hours per video disc side.

And in Model 5, you get all of the above plus digital data storage—it's a video disc and floppy disc in one, for creating training programs of unparalleled sophistication.

As your requirements change, you can create any of these configurations with simple internal board changes—not a clutter of cables and boxes.

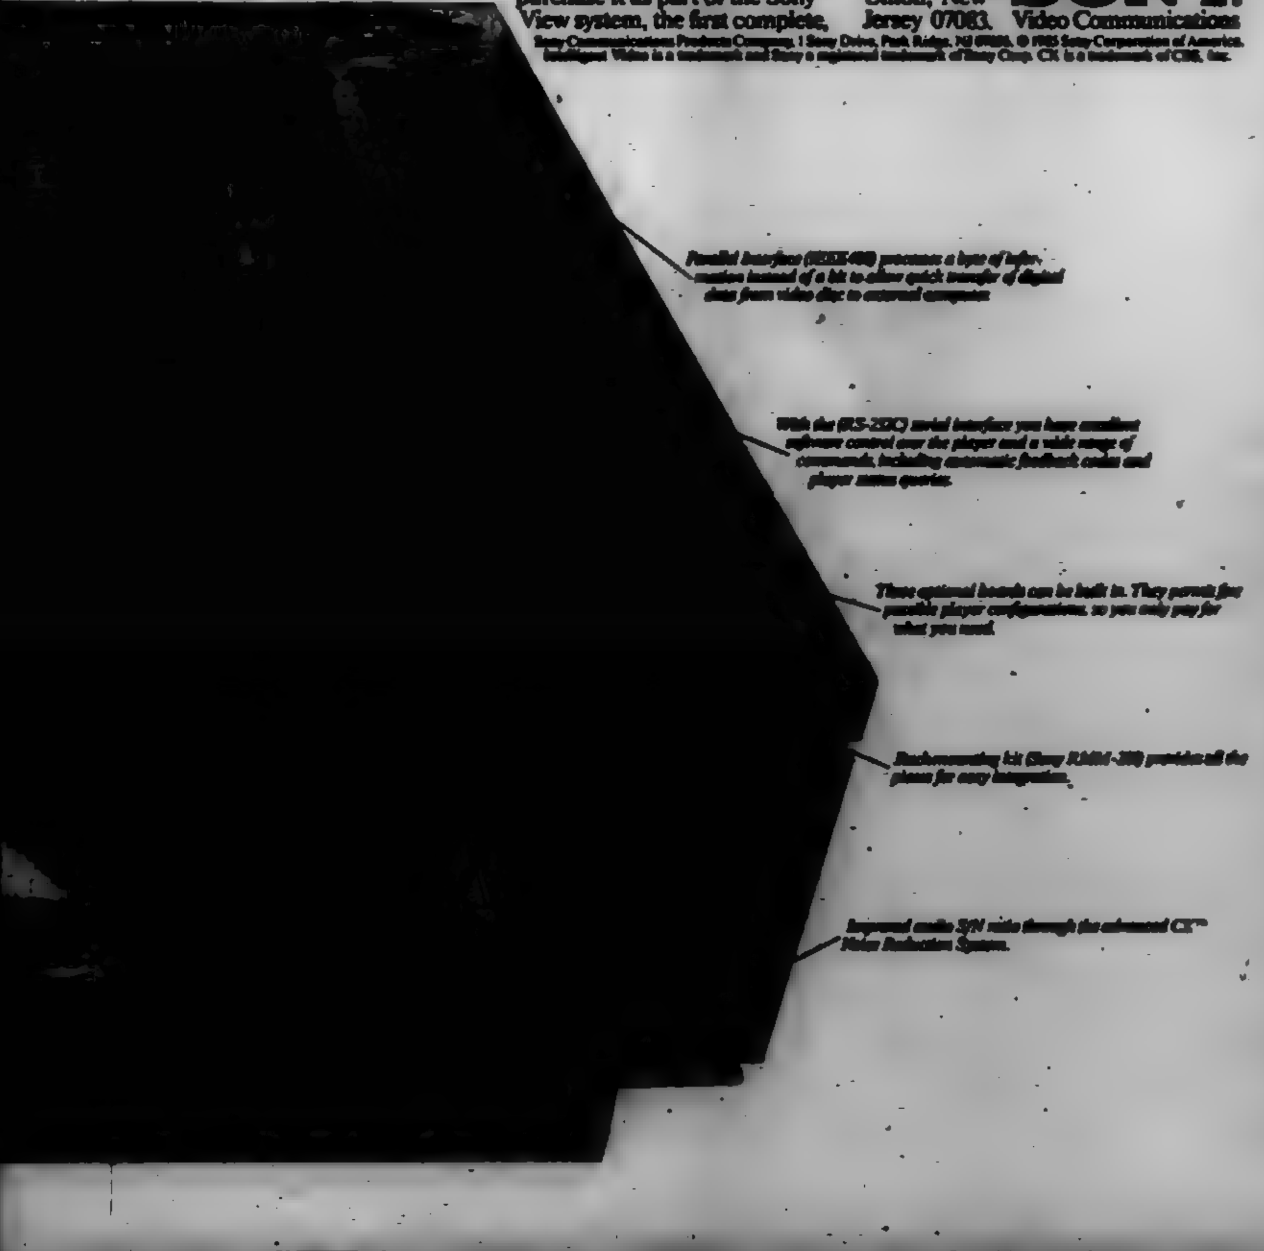
And the LDP-2000 is more than just the smartest player in the world—it's the fastest. Accessing up to 54,000 frames within 1.5 seconds.

You can plug it right into your interactive video system. Or, you can purchase it as part of the Sony View system, the first complete, totally-integrated image-processing system designed specifically for interactive video.

If you'd like to significantly boost the IQ of your Intelligent Video system, do the only intelligent thing. Contact us at the Sony Information Center at P.O. Box 6185, Union, New Jersey 07083.

SONY.
Video Communications

Sony Communications Products Company, 1 Sony Drive, Park Ridge, NJ 07656. © 1985 Sony Corporation of America. Intelligent Video is a trademark and Sony a registered trademark of Sony Corp. CX is a trademark of CBS, Inc.



Parallel interface (IEEE-488) processes a byte of information instead of a bit to allow quick transfer of digital data from video disc to external computer.
With the (RS-232C) serial interface you have excellent software control over the player and a wide range of commands, including automatic feedback codes and player status queries.
Three optional boards can be built in. They permit five possible player configurations, so you only pay for what you need.
Rackmounting kit (Sony RMM-300) provides all the pieces for easy integration.
Improved audio S/N ratio through the advanced CX™ Noise Reduction System.

HOW TO MAKE SURE YOUR OFFICE CAN ROLL WITH THE PUNCHES.

SYSTEM MANAGEMENT LETS YOU CHANGE YOUR COMMUNICATIONS SYSTEM ACCORDING TO YOUR NEEDS. IT'S ONE OF MANY INTEGRATED FUNCTIONS OF AT&T SYSTEM 85 AND AT&T SYSTEM 75.

Things happen fast in the business world. You've got to be on your guard, quick on your feet, able to bounce back, or you're out for the count.

With System 85 and System 75 from AT&T Information Systems, you can be ready for anything. You'll have the most powerful, most flexible communications systems in the world at your command.

YOU CONTROL THE SYSTEM

The centralized System Management function puts you in complete control of the system's operation. You have a hands-on ability to respond to your changing needs quickly and easily. Here are a few of the things it can do for you:

Terminal Change Management If the game "musical offices" is popular in your business, this feature can give you an edge. It lets you add, remove, or relocate equipment easily. You can also customize terminal features so the right people have the capabilities they need. Changes can be made on-line, reducing costly downtime. And they only have to be made once on a common data base at a central location. Related data bases are updated with the same information automatically.

Cost Management Call privileges can be granted or withdrawn as you see fit. Call detail can also be recorded and allocated by department, project, or individual to help you keep a tight rein on expenditures and abuse.

Facility Management You determine how you want your calls routed so you'll be sure you're always using the least expensive lines available. This function also optimizes network performance by giving you the power to administer its many features, like Automatic Route Selection and Trunk Group Translation.

Traffic Management This is a set of tools that collect, summarize and report on system performance and usage. Data concerning the operation of your system can be stored on disk files, and called as needed.

System Management is just one of the many functions of System 85 and System 75. Others are specifically designed to facilitate office management, voice and data communications, and networking. Whatever your needs, you can custom-tailor a system that's right for you.

OVER 100 YEARS OF EXPERIENCE

System 85 and System 75 are designed according to the guidelines of Information Systems Architecture. That translates into investment protection, because future generations and upgrades will be designed to fit right into your existing system.

There are a lot of decisions you have to make. And there is no margin for error. Our leadership in communications goes back over 100 years. We have the largest sales and service staff in the industry. Those are just two more reasons why you should call your AT&T Information Systems Account Executive or 1-800-247-1212, and ask about System 85 and System 75.

MIS security a risky gamble

MIS executives, beware. If your system is hit by a computer criminal whose identity is discovered, the odds are better than nine to one that he is a company insider.

That was one message from a recent survey of Data Processing Management Association members [CW, June 10].

Although the odds are favorable that your system will not suffer some form of abuse, the survey's statistics may be painting an unrealistically optimistic picture. Companies are admittedly reluctant to divulge system abuses — that's the survey's second message. Out of 56 abuses outlined in the study, just 2% were reported to authorities. In addition, more than half of the respondents who were victims of abuses said they believed the abuses occurred either because the employees were ignorant of proper professional conduct or as a result of the perpetrators' "misguided playfulness."

The number of computer crimes written off because of embarrassment, the potential for bad publicity and the corporate funds needed for legal fees if a decision to prosecute is made is any expert's guess. And more than half of the survey's respondents apparently don't believe the problem has become serious enough to warrant any sort of data security staff.

If you are optimistic and believe computer crime couldn't happen in your organization, consider the following:

- The same issue of *Computerworld* in which the DPMA survey was reported also carried a story on two former employees of the Social Security Administration who were charged with computer fraud to gain SSA benefits. It is still unclear exactly how much money the defendants obtained, but Assistant U.S. Attorney Henry Wingate referred to the theft as a "large sum."
- Wilson Jones Co., a subsidiary of American Brands, Inc., recently had to come up with hard cash for Micropro International Corp. to obtain an out-of-court settlement of a suit charging that Wilson Jones employees had engaged in unauthorized copying of three Micropro software products. Although the amount of the settlement was unspecified, the original suit requested damages of $225,000 and the return of any profits earned as a result of the alleged copying [CW, June 3].
- A Houston programmer was charged earlier this year with the theft of $100,000 for alleged fraud involving the illegal tapping of a credit bureau's computer system [CW, Jan. 14].
- In 1983, the banking industry paid premiums totaling $11.6 million for overall DP insurance policies and an added $4.7 million for separate computer crime policies [CW, Jan. 14]. Although more recent figures have not been compiled yet, chances are good that those premium charges have not gone down.
- *The New York Times* and *The Washington Post* both recently reported that the U.S. Department of Justice is expanding the Federal Bureau of Investigation's national computer system to include information about persons suspected of committing white-collar crimes. It's a case of using modern technology to detect and prosecute the criminals who use the same technology to commit fraud, according to Associate Attorney General D. Lowell Jensen.

If computer abuse takes place in your shop — whether committed by an employee or an outsider — it will be expensive. It's also clear that both the banking industry and the FBI (neither of which are known for fast-moving reactions to change) are taking computer fraud very seriously. Isn't it high time you did the same?

LETTERS

Cable search an unrealistic scenario

Perhaps I missed the point completely, but I came away from reading the column "The cable quest: Abracadabra in Akihabara" [CW, May 13] and the conclusion to it [CW, May 27] with the impression that a large amount of high-visibility magazine space was wasted. Aside from stating the all-too-obvious fact that the hardware manufacturers are insensitive to the needs of the user, the column illustrated only that users show too much forbearance in waiting for things to be done for them.

A cable is a piece of wire with a connector at each end. An RS-232 cable, by definition, is terminated with miniature 25-pin connectors. The main differences between cables is in the number of signals used: from three to a maximum of 25. In many cases, an off-the-shelf, 25-conductor cable will do nicely. In rare cases, you may have to swap the second and third pins (transmit/receive) to get it to work.

All the parts necessary for the column's author to make the missing cable were readily available. If an off-the-shelf cable wouldn't work, and if the specifications for the cable were not supplied as part of the operator documentation, they were probably available by making one phone call to the manufacturer. And, if all else failed, you just pull out some wire, two plugs and a soldering iron and try different hookups until you get it right.

If you get into deep trouble, call the nearest junior high school student and he'll have you up and running in 15 minutes.

VIEWPOINT

Alternative jobs for the frazzled MIS manager

THE DATA CENTER
John P. Murray

Sometimes — probably not more than three times a week — when things get a little hectic and clients become unusually irate — often over matters of little consequence, such as project delays, the delivery of incorrect reports, slow network response times or the unavailability of the system — some of us think about putting our talents to a more effective use in some other area.

It seems reasonable to assume that many of us in the information processing profession share a number of similar skills, knowledge and interests. In addition, I suspect that because we are attracted to the work we share a number of personality traits.

Therefore, as a public service, I would like to present some viable options for career changes. I will add what I believe are pertinent comments to these various options to help you better analyze each opportunity given your particular interests and skills. I hope this material will benefit you in some way.

Some of these suggested new occupations may not readily come to mind and may indeed be considered somewhat unorthodox, but please bear in mind that you did not become an information processing specialist overnight. The application of effort and diligence will help you carry the day in any of these new areas.

Brain Surgeon. As I understand it, this line of work requires a large ego, and I think most of us in information processing would qualify. Also, as I understand it, this is a somewhat complex trade to master. You may want to start out nights and weekends and continue with your present occupation for a few weeks until you become comfortable. The pay is pretty good, and you get to work in a place that is clean and well lighted. True, some of you may consider spending your working hours with sick people depressing. However, considering that you have spent years with information processing clients, this is something to which you should be able to grow accustomed.

Symphony Conductor. The skill set required here, aside from some ability to read music — which is no real problem; anyone who can read a Cobol program can learn to read music really fast — involves being able to bring together a number of people and to mold them into a harmonious group working together to produce a high-quality end product. Well, on second thought, perhaps this may not be an ideal choice after all.

Hair Dresser. This may be the one for me. After all, people will always need their hair fixed up. The expense required to get started should be low: Rent a storefront; put in some glass, chrome and pink chintz; buy a hair curler and some home permanent stuff; and the business is extant. You do need a degree of manual dexterity, not as much as you would for brain surgery, however. The years I spent handling punch cards made my fingers very supple, so that is not a problem.

From computers to curlers

The more I consider this occupation, the better it looks. I have picked the name "Mr. Jonnie's Hair Boutique." So, if you desire to get started in this line, pick some other name. However, don't despair, I may decide to make this a franchise operation — it could become the McDonald's of hair salons. If so, we can arrange to set up a "Mr. Jonnie's" in your area. Let me know soon if you are interested because I expect choice locations to go fast.

These are some career alternatives for us to consider when things get difficult. It is necessary that we become and remain aware of the requirement to carry out the appropriate planning, set goals and adopt a phased approach to this project so that success will at least be a reasonable prospect.

This list was designed to encourage those of you thinking of going across the street for a few dollars more to consider the full range of your options, to raise your sights, to broaden your horizons and to better appreciate the value of your special skills and experience so that you can at least consider some other profession where you can make a significant contribution.

IBM whets OA mart appetites, but when will it deliver?

WOHL STREET JOURNAL
Amy Wohl

Confusion reigneth. The office automation customers who thought they had a secure strategy last year have been reading their tea leaves, reexamining any convenient crystal ball and stopping soothsayers in the streets, hoping to find out what to do.

The confusion stems from IBM's strong entry (IBM would say reentry, or continuing presence, I suspect) into the OA market last fall with new, additional or enhanced products, plus promises of a rosy future. IBM's marketing stance for these new produts (especially the System/36 with Personal Computer workstations and software, but also PC Network and other products) has been aggressive enough to evoke howls of pain from competitiors, cries for mercy from users and giggles of glee from consultants asked to explain the whole thing.

On the surface it's simple enough. Consider the following:

- IBM has a game plan for "well-behaved" user organizations: They should start hooking their myriad personal computers together using System/36s to provide interconnection and systems-level OA functions. This strategy is limited by a number of factors — software that hasn't hit its delivery date yet, the lack of integration across functions — but it is, at last, IBM's strategic OA product. Presumably, additional announcements this year and next will offer more workstations (a mysterious melody of "PC/2" wafts through the air), additional workstation and systems-level software and, eventually, attachment to the yet-unannounced IBM Token-Passing Daisy Ring network via Big Blue cables.
- There is a nonstrategic (nonstrategic to IBM, that is) but fairly popular IBM alternative: attaching IBM Personal Computers to the IBM PC Network and using Microsoft Corp.'s DOS 3.1 and IBM Personal Computers as servers to create a local-area network. Sounds modern. But customers tell us IBM definitely downplays this alternative and, in fact, actually tries to convince customers that this is a short-term Band-Aid, aimed only at small groups of users who don't need a real OA system. In fact, we've never seen this actively proposed to a customer; it seems to be a fallback product for stubborn customers who insist on a local-area network installation now, not later.
- Some IBM customers continue their Professional Office System (Profs) experiments under the VM banner. Although IBM has promised to hook Profs and the Distributed Office Support System together, the Profs world continues to attract mainly DP managers looking for easy-to-implement, low-level (low function, that is) OA solutions. Profs passes nearly no OA committee's eagle eye if delivered function is the measure of product selection.
- The older IBM solutions still on the market are now perceived as ended games. The 8100 has never been a popular solution, and the 5520, as a nonprogrammable system, never really played in the OA world. Displaywriter will go "poof" as soon as IBM finishes the Displaywriter III software announcement for the Personal Computer with a secretarially acceptable keyboard. In any case, these products are not causing the commotion.

So what's going on?

In many cases, IBM has used the announcement of the System/36 OA Strategy to convince customers to reopen already-made OA decisions. This has wreaked havoc with competitors' revenue plans — to say nothing of their morale. There is nothing wrong with customers having one more look at the marketplace before making an important decision, but competitors claim IBM is having a chilling effect on their ability to market available and superior products. Meanwhile, IBM finishes making a series of announcements with delivery dates for a completed IBM product far in the future. (Industry analysts estimate that delivery of the IBM Token-Passing Daisy Ring network, for example, could be several years away, and so is the case for big pieces of the integration of function within the System/36.)

In fact, every major OA vendor is already offering a strategy similar to IBM's. They are attaching their own and IBM's personal computers as alternative, high-function workstations to minicomputers offering interconnection and systems-level functions: This is Digital Equipment Corp.'s VAX with All-in-One, Data General Corp.'s MX plus CEO, Hewlett-Packard Co.'s HP 3000 with Interactive Office and Wang Laboratories, Inc.'s VS line with the Wang Office. All offer IBM Personal Computer support, although with a somewhat less functional integration than they can provide within their own personal computer offerings. These are mature OA products, with the normal accretion of software and software enhancements. All appear regularly on user organizations' short lists of preferred vendors.

The appearance of an IBM OA solution (strategic or not, final or not) seems like manna from heaven to users who are anxious to pick a vendor with whom to do business and to start installing something (anything) now — preferably something compatible with the de facto IBM Personal Computer standard that nearly every user organization has adopted. Users are once again saying, "No one ever got fired for picking IBM." And that, in itself, is soothing.

But will IBM offer users — especially large organizations with significant OA experience — satisfying solutions to meet their needs and high expectations? And when will these solutions arrive? Is a bird in the hand better than two bluebirds in the bush? Users are confused. IBM's competitors are harried and angry.

The story is still without an ending, but in a world where the ending can always be changed with a keystroke, permanence is an unexpected quality. Both IBM and its competitors will somehow muddle through this latest battle and live to fight another day.

#3 In A Series: Setting Standards in Mainframe Applications Software.

Could This Be The End Of Hand-Me-Down Software?

Think of how applications software has always been built. And enhanced.

A quick fix on a piece of general ledger software . . . another loop on the accounts payable package . . . a hasty patch to the payroll program and presto: Announce to the world a "revolutionary new generation of software designed to address today's information needs."

Not only is it not true. It doesn't work anymore. And you deserve something better. Something more than a hand-me-down, patched-up solution.

Which is what Software International, the company whose first general ledger package started the applications software business, is suggesting right now.

The time has come to put aside expedient answers. To dismiss short-lived whistles and bells. And to begin building and delivering software that makes real sense both from the data processing and end-user points of view. Software, built cleanly, intelligently, that gives you increasing value over the long term.

We detail our thoughts in a 35-page white paper entitled "Setting Standards in Mainframe Applications Software." We'll send you a copy at no cost.

The paper focuses on fifteen topic areas we believe to be critical to the long-term success of applications software installations. It looks at the coming generation of "intelligent" software architecture and what that will mean for you.

Our paper covers software installation, service and support. In short, what you should expect — even demand — from your software vendor.

Whether you are developing your own software or evaluating a package, you'll want to read this timely report.

It'll shed fresh light on some old ideas.

For a copy call 1-800-343-4133, in Massachusetts 1-800-322-0491, or clip the coupon below.

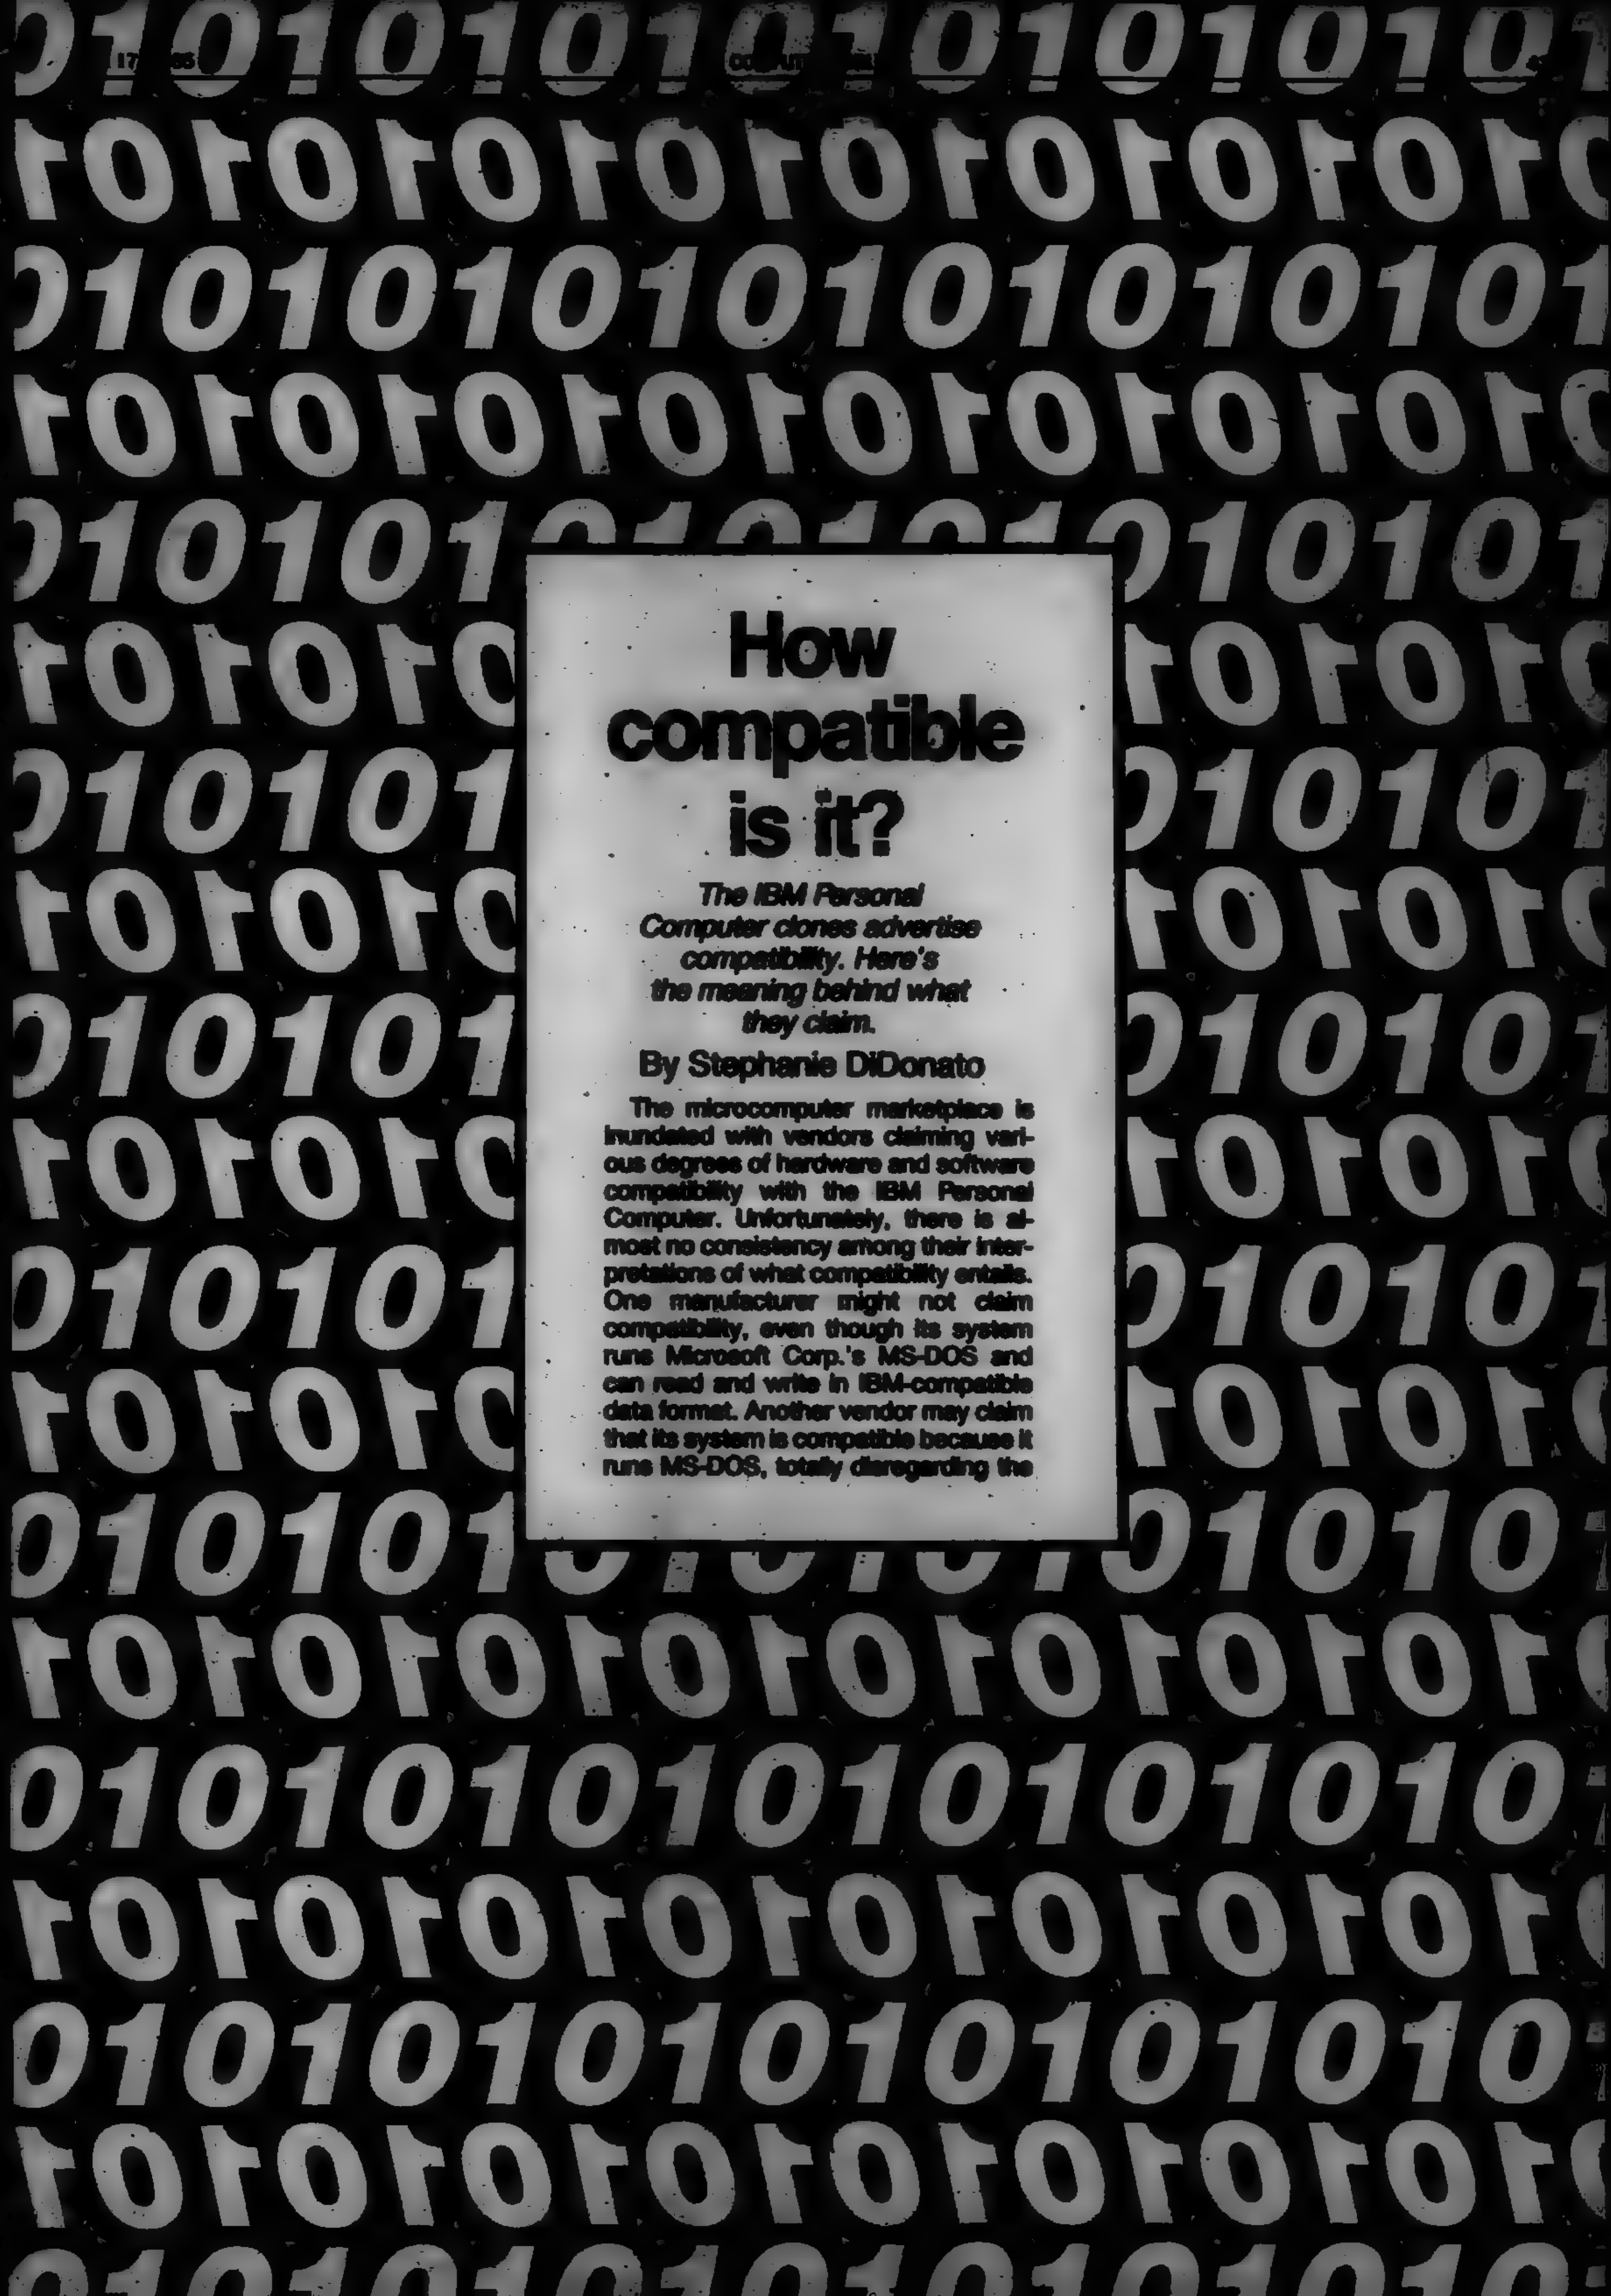
Software Thinking That's Impossible To Ignore.



How compatible is it?

The IBM Personal Computer clones advertise compatibility. Here's the meaning behind what they claim.

By Stephanie DiDonato

The microcomputer marketplace is inundated with vendors claiming various degrees of hardware and software compatibility with the IBM Personal Computer. Unfortunately, there is almost no consistency among their interpretations of what compatibility entails. One manufacturer might not claim compatibility, even though its system runs Microsoft Corp.'s MS-DOS and can read and write in IBM-compatible data format. Another vendor may claim that its system is compatible because it runs MS-DOS, totally disregarding the

Matt's office has been winning a lot of new business lately. And it's really not much of a secret.

Because he and his co-workers have been able to make more efficient use of their resources. How? Well, Matt brought in Team Xerox.

Which includes Xerox 8010 Star

"I heard you underbid us by half a million. What's your secret?"

Workstations, high speed laser printers, file servers for organizing and storing data and communications servers for accessing mainframe data bases, all linked together with a Xerox Communications Network. For complex analytical tasks, Xerox also included a Xerox Artificial Intelligence System.

So Matt (and the people in his domestic and international offices) could create, access, share and react to information more quickly and more easily than ever before.

And since Matt's office has become so much more productive, he was able to cut costs—and enter a bid that was $500,000 less than anyone else's.

To make Matt's secret yours, call Team Xerox at 1-800-833-2323, ext. 42 or send your business card to Xerox Corp., Dept. 42013, P.O. Box 24, Rochester, NY 14292.

fact that data is read and written in a different format on different capacity diskettes.

Users need to ask the following questions in order to assess a system:

- Can I run all versions of IBM's PC-DOS on the compatible system?
- Are the central processors in the two systems compatible? Are they based on the same or related microprocessors?
- Can I take an IBM board or a board-level option, such as the color graphics display adapter or the expansion box, and plug it into my compatible system?
- Is the compatible's keyboard identical to the keyboard supplied by IBM? If the compatible features additional keys, how do they affect the compatibility of programs or data generated with/without the use of these keys?
- Can I take IBM programs that use the Personal Computer graphics features and run them on my system?
- Will the compatible system read from and write to diskettes taken from the IBM Personal Computer without changes or conversion first? Will the IBM Personal Computer read from and write to diskettes taken from the compatible without first making alterations?

Software compatibility

Microcomputer operating software tends to be closely related to the CPU and I/O structure of a system; therefore, it's not completely portable.

When buying a software program designed to run, for example, under MS-DOS, make sure to find out which implementation of MS-DOS. IBM's PC-DOS is just one of many.

There are significant differences in capability among the four major upward-compatible software levels available to users of the Personal Computer — between systems controlled by read-only memory (ROM) Basic without MS-DOS or any other operating system, PC-DOS 1.1, PC-DOS 2.0 or 2.1 and PC-DOS 3.0 or 3.1.

PC-DOS 2.1 is very similar to (and replaces) PC-DOS 2.0; it includes several fixes and extensions of enhancements introduced for 2.0. DOS 3.0 is an enhancement over DOS 2.1 and is being replaced by DOS 3.1. DOS 3.1 will provide all 3.0 capabilities and support the IBM PC Network. Neither replaces DOS 2.1.

These four levels are largely upward compatible. Programs designed to run on a Basic system can usually run on a DOS system but not the reverse; programs designed to run on DOS 1.1 systems can usually run under DOS 2.X and DOS 3.X but not the reverse. Furthermore, DOS 1.1 cannot handle hard disks and consequently cannot run on the Personal Computer XT; it also is not supported by the Personal Computer AT.

DOS 2.0 runs on the IBM Personal Computer and Personal Computer XT diskette-based or hard disk-based models. It has been replaced by DOS 2.1, which runs on PCjr diskette-based systems as well as on the other Personal Computers and the Personal Computer AT. DOS 3.0 and 3.1 support the Personal Computer AT as well as all other IBM personal computer models.

Other operating environments, such as CP/M86 and Concurrent CP/M are also available for the Personal Computer, but the primary focus of IBM and its competition has been the development of PC-DOS versions of the MS-DOS environments.

Can I run all versions of IBM's PC-DOS on the compatible system?

IBM's PC-DOS is a modified version of Microsoft's MS-DOS. MS-DOS is a fairly transportable generic operating system designed to run on the Intel Corp. 8088/8086 microprocessors or their 80188/80186 and 80286 counterparts. Because it must adapt itself to an individual architecture, incompatibilities are likely to arise between one MS-DOS system and another. These incompatibilities can conceivably be circumvented, however, through software and/or firmware adjustments, if the vendor wants to put in the effort.

MS-DOS has its own Basic I/O subsystem (Bios), which was designed to be implemented in user ROMs in a manner consistent with the vendor's developing architecture. A compatible vendor must implement this Bios in such a way that it is not identical to IBM's proprietary ROM Bios code, yet provides the same functionality and interfaces in a manner totally transparent to the user's hardware and software.

The Bios contains code for the operating system bootstrap, for system checkout and testing, for interrupt vectors allowing Bios-level interfacing for I/O manipulation and for the initialization of memory, interrupt vectors, scratchpad, I/O and flag values. It is particularly important that ROM Bios interrupt vectors are initialized to point to the same functions found on the Personal Computer.

As is the case with the more advanced Basic interpreters for diskette- and disk-based systems, IBM uses the existing (cassette-level) ROM Bios together with a tailored software Bios to achieve the equivalent of all the software Bios-supplied with MS-DOS. A vendor can implement this in various combinations of ROM and random-access memory (RAM) as long as certain addressing, interrupt and memory constraints are respected.

Another essential problem in trying to achieve software compatibility is that the vendor is always shooting at a moving target. As the primary vendor improves on or expands the system's capabilities, new operating system releases (or new Basic releases) may be needed to exploit fully the expanded capabilities. A program designed to run under the old operating system release may not run under the new one without modification.

The first DBMS conceived for online systems, remembers more.

You can fill your VM, OS or DOS environment with a lot more information with MODEL 204 software from Computer Corporation of America.

And, you won't have to add hardware to your IBM mainframe to support MODEL 204.

Because, while our MODEL 204 DBMS lets you create up to 523 billion records of any length, it is so incredibly efficient that it requires less CPU memory than other systems to do it.

Plus, you can transport files and applications between operating environments (VM, OS, DOS) without conversion.

And, with its fourth generation tools, tough applications are easy to create, test or change without affecting the database. Conversely, unlike any other DBMS, as your business data tracking requirements change, you can add or change new or existing fields without unloading, recompiling and reloading the database. Saving you time and manpower.

And it's fast. Faster than any other DBMS. Even as you add more users it's faster. Amazingly, MODEL 204 can support any size network from 30 to 30,000 terminals.

MODEL 204 is the first commercial DBMS designed right from the start for online systems. You'll find most other DBMS's have been converted from batch. There is a difference.

We invite you to compare the capacity, performance and productivity of our MODEL 204 with any other DBMS. Write, or call 1-800-258-4100.

Send more MODEL 204 information fast.

Software innovators creating better ways to manage business.

For example, IBM's PC-DOS 2.X releases were developed with the introduction of the Personal Computer XT and PCjr respectively, while PC-DOS 3.X was unveiled with the Personal Computer AT, but all will run on the original Personal Computer. When IBM announced PC-DOS 2.1, it stopped selling PC-DOS 2.0 altogether and later PC-DOS 1.1. Yet certain programs developed for operation under PC-DOS 1.1 will not run without modification under PC-DOS 2.0 or 2.1; IBM published a list of these when it announced PC-DOS 2.0.

> *The issue of compatibility might not be so difficult to resolve if compatible hardware and software vendors would be more precise as to the specific operating system versions for which compatibility is claimed.*

The issue of compatibility might not be so difficult to resolve if compatible hardware and software vendors would be more-precise as to the specific operating system versions for which compatibility is claimed.

Hardware compatibility with the Personal Computer is manifested in several ways — through the CPU, the expansion slots, the disk drives, the keyboard and the display. If any of these areas don't conform with the Personal Computer, then the system will not be completely compatible.

Are the central processors in the two systems compatible? Are they based on the same or related microprocessors?

The CPU in a microcomputer system is usually equated with the primary microprocessor used to execute the primary instruction stream. For the Personal Computer, the primary microprocessor is an Intel 8088, which is part of a compatible family that includes 8085, 8086, 80188, 80186 and 80286 8-bit and 16-bit chips.

It is conceivable that a fully Personal Computer-compatible microcomputer system could be designed with any of these chips by firmware or software programming around differences in implementation of essential functions. The 80188 was specifically designed as an upgrade to the 8088; the 8086's difference in data bus width is compensated for by almost identical interfacing to the bus.

The Personal Computer AT implementation of the 80286, however, is experiencing some compatibility problems. Nevertheless, almost all currently delivered systems that claim full compatibility (hardware, code, disk, keyboard, I/O, software) use the 8088 as a base. It seems logical that a company primarily interested in marketing a highly compatible system would choose the 8088, which is identical to IBM's microprocessors, and thus cut back on the compatibility adaptations needed. On the other hand, if a company wants to implement an MS-DOS system with disk/data compatibility and enhanced features over what IBM offers, the logical choice is the more powerful 8086, 80186 and 80286 processors.

The compatibility of the basic microprocessor component is only the first issue. If a vendor says a system is based on an Intel 8088, he does not usually mention that the interrupt control logic, CPU timer, direct memory access control and so on are on separate microprocessor chips. The user is presented with a system having numerous hooks for direct interaction with basic peripherals and systems software.

The software as it is currently implemented is also open to some adaptation and alteration by the user. The variety of entrances and exits to and from the IBM code and the possibility of implementing changes that IBM may later implement in a different manner means that developing a highly compatible personal computer is difficult. The systems cannot be identical and do not have to be, but they should function as if they were.

Can I take an IBM board or board-level option, such as the color/graphics display adapter or the expansion box, and plug it into my compatible system?

The question of whether a compatible system can add board-level options and I/O slots is easy to determine because there is an obvious physical interface that probably would not be implemented without associated logic support. In the most compatible systems, the basic system unit can accept IBM boards, including the board that allows attachment of the IBM expansion unit for adding hard disk and additional I/O slots. Corona Data Systems, Compaq and Columbia Data Products, Inc. are examples. (Columbia Data Products recently filed for protection under Chapter 11 [CW, May 13]).

At a second level, the compatible system does not itself accept IBM add-on boards but instead attaches to a special expansion unit through a compatible bus interface. The expansion unit accepts the IBM boards. This method of attachment is used by the Seequa Computer Chameleon. In this case, the 8288 bus controller chip and the 8237 direct memory access controller chip or their compatible counterparts would be likely control modules.

At another level, the presence of a compatible physical interface (in other words, parallel printer port) does not mean that a device can be attached and run. A compatible I/O driver for the specific device must exist in the system or be added.

The physical attachment of I/O devices can incur unexpected obstacles. For instance, when IBM unveiled the Personal Computer XT with eight slots (as opposed to five slots in the Personal Computer), the slots were positioned more closely together in the XT system unit than in the Personal Computer. IBM boards fit, but some boards made by third-party vendors were too thick, especially if they had a piggyback option.

Is the compatible keyboard identical to the keyboard supplied by IBM? If there are additional keys on the compatible system, how do they affect the compatibility of programs or data generated using these keys?

The consideration of keyboard compatibility between the Personal Computer and its look-alikes has two facets — the man-machine interface and the system compatibility interface.

The 83-key, Personal Computer keyboard deviates from the familiar IBM Selectric keyboard in a number of ways that many users find annoying. Most irritating is that the left shift lock is not in its traditional place next to Z, but is one key over, after a backslash key. Some users don't like the function keys placed in a pad to the left; they would prefer them in a row across the top of the keyboard.

The issue of what a single user prefers, however, is complicated further when multiple systems are used in a business setting, and people find themselves using different micros at different times. If each has a different keyboard layout, the user's conditioned responses are snarled, and error rates and irritation rise while throughput goes down.

To combat this problem, vendors aiming at compatibility usually supply a keyboard identical to IBM's in spite of known problems. If alternative layouts are supplied, they usually move toward the standard Selectric layout. Some vendors supply more than one alternative.

To what extent are alternative layouts likely to be incompatible? The answer is that a change in position is unlikely to cause problems, but the addition of new functions may or may not. IBM's method of implementing keyboard-to-CPU communications is highly amenable to software alterations. No individual key produces a single code that is translated directly to an Ascii equivalent; instead, two codes are produced, one as the key is struck and one as it is released.

The codes are collected in a 20-char. buffer that is controlled by a separate microprocessor chip, the 8048, as well as ROM Bios. Bios processes the single keystrokes or keystroke combinations that generate legal Personal Computer codes — a 256-byte-extended Ascii character set plus 40 function key codes.

The 8048 monitors and reports keyboard activity, generates a Bios interrupt for every key action, notifies the user if the buffer is full and the system isn't responding to interrupts and performs diagnostics.

This indirect path between the keyboard signals and the generation

A guide to the chart

Many vendors claim IBM Personal Computer compatibility, and there are various levels of compatibility. The Data Decisions chart on the opposite page points to products with specific capabilities.

When examining this information, it's important to bear in mind the three levels of Personal Computer compatibility:

Personal Computer compatibility. These systems run most IBM Personal Computer software packages, use the Intel Corp. 8088 microprocessor, accept IBM peripheral cards, can read/write IBM disks and have the same user interfaces for the display, keyboard and sound. This group can be subdivided into the highest degree of compatible systems, which includes machines that run 98% of Personal Computer software, and lower levels, which include systems that have problems running some of the programs, mostly in the graphics area. These lower level systems also may accept most, but not all, of the Personal Computer expansion boards.

Data compatibility. These systems usually don't run major IBM programs. They can't use IBM expansion cards and have different user interfaces. What they can do is either read or read/write IBM data files.

MS-DOS compatibility. Systems in this group can't even swap data disks without converting the disk media.

The chart presents an overview of the most popular Personal Computer-compatible systems on the market. Many of the systems have not yet been fully tested by Data Decisions. Therefore, their level of compatibility is based solely on vendor specifications and claims.

If you plan to purchase a compatible, you should test the system for yourself before making a final decision.

The column headings going across the top of the chart address issues of hardware compatibility and system configuration.

Compatible expansion slots. If a system accepts Personal Computer expansion cards, the number of available compatible slots is shown. A "0" indicates that although the system isn't board compatible, it has slots for noncompatibles — or that it does not have expansion slots in the unit but can attach a compatible expansion chassis. The Comments section indicates which is the case.

Graphics compatible. This category shows what systems utilize the same graphics capability as the Personal Computer, either as a standard feature or system option.

CPU speed. This shows the CPU speed in MHz. If a system has more than one speed, the fastest speed is shown, and the Comments section will indicate that it is switch selectable.

Processors. Indicates what CPU a system runs under, what systems use an 8-bit co-processor for running CP/M applications and whether a system has an 8087 socket for implementing an Intel 8087 for faster numeric processing.

Memory. Shows the amount of memory a system comes with in its base configuration, how much memory can be placed on the mother-board before having to use expansion slots and the maximum amount of memory a system can handle.

Ports. Shows how many serial and/or parallel ports a system provides as part of its base configuration.

Hard disk. Shows which systems include a hard disk in their base configurations.

Bundled software. Indicates what type of software is included in the system price.

Base configuration. Shows what components are included in a system's entry-level model.

Price range. Indicates a system's base price range.

Comments. Any relevant information not presented in the chart is shown in this section.

MITRON'S STD 1600 Simplifies Data Transfer By Communicating Off-Line Tape-To-Tape

Mitron's STD 1600 provides an efficient method for sending and receiving data anywhere in the world. STD 1600s communicate with each other and with other companies' bisynchronous terminals and computers.

The STD 1600 solves machine compatibility problems. It transfers data reliably without mailing tapes. It can communicate off-line to relieve an overworked computer.

STD 1600s transfer data at speeds up to 56KB. Double-buffering eliminates delays caused by read/write cycle times.

The STD 1600 can be leased or purchased.

STD 1600 features:
- Easy-to-install
- Needs no software
- Data rates to 56KB
- RS-232 or V.35
- Dial-up or private line
- Multiplexers
- 800 or 1600 bpi
- 1200' or 2400' reel sizes
- Bisynchronous protocol
- Transparent or non-transparent
- Space compression
- Variable size records to 16K
- Labels and multiple files

STD 1600 options:
- Autodialing
- Asynchronous
- Code conversion
- Modem eliminator

Compare the price and performance of the STD 1600 with your present tape-to-tape system. Call Mitron to arrange a live test with your tapes.

Since 1969, Mitron's magnetic tape systems have been used in a wide variety of data communications applications. Let one of our Applications Engineers explain how you can connect the Mitron STD 1600 to your system or data communication network. Call 800-638-9665. (In Maryland, call 301-992-7700.)

(Continued from Page 47)

of characters means that the keyboard character set can be easily redefined; changed key positions can be coded by means of software and new function codes entered.

The problem with this flexibility is that if a vendor makes use of it to assign unique functions to unused code combinations, the software can become incompatible if IBM assigns a standard function. The bright side is that compatible vendors are unlikely to have great difficulties designing compatible keyboards or implementing a fix for a bug.

Can I take IBM programs that use the Personal Computer graphics feature and run them on my compatible system?

When IBM introduced the Personal Computer, it also offered two graphics boards for use with the system. The monochrome board provides a resolution of 640 by 200 pixels while the color board offers 320 by 200 pixels in four colors. Because the boards were from IBM, they quickly became the standard to which most graphics packages were written.

Many people felt that these graphics capabilities were less than the best possible considering the current state of the art. Consequently, many vendors that preserved compatibility in most respects chose to implement a system with better but incompatible graphics resolution. Adding more pixels per square inch creates a sharper character image and plotline, but it creates problems for software that addresses either 640 or 320 by 200 pixels.

This type of incompatibility is common among IBM competitors that otherwise call themselves compatible; they provide incompatible enhancements. Some manufacturers have found solutions that combine the best of both worlds. The Corona personal computer, for example, features 1,280 by 325 pixels but addresses 640 by 325; each X-axis instruction parameter relates to 2 pixels, which is easily adapted to IBM compatibility.

That still leaves compatibility problems on the Y-axis. The logic provided by Corona manipulates all 325 pixels independently and, therefore, it is incompatible. To compensate, the system was designed so that someone who wants to run a program that uses compatible graphics can add one of the IBM graphics boards; the display is then manipulated as if there were only 640 or 320 by 200 pixels.

Will the compatible system read from and write to diskettes taken from the Personal Computer without changes or conversion first? Will the Personal Computer read from and write to diskettes taken from the compatible without first making alterations?

IBM offered cassette storage connection capabilities on the original Personal Computer but never supplied a drive; the ability to connect a cassette drive is not even offered on the other Personal Computer models.

Even on systems with larger fixed hard disks, the diskette drive is used to load programs, store data off-line and back up the fixed disk. A streaming tape drive might be more logical for backup, but a tape drive is usually more expensive and not as flexible as the diskette drive because diskettes can be accessed randomly and are easier to mail.

Data on the diskette drive, moreover, is usually recorded in the same format or a subset of the format used on the hard disk; each is preformatted and generally accessed through the same basic logic and tables that control the fixed disk. When inquiring about disk compatibility, the user refers to both disk and diskette media and tends to focus on the removable, exchangeable diskette.

For diskettes from different systems to be fully compatible, they must be compatible in four ways. First, they have to be the same size. Second, the data records have to be recorded in the same machine code (Ascii, Ebcdic) and use the same basic file and record organization with the same headers and pointers. Third, the way the data track is formatted on the diskette has to fit the operational characteristics of the drives on both systems. Fourth, the access logic in the system and running program must match the organization of the directories on the diskette or the system can hang up.

Physical compatibility

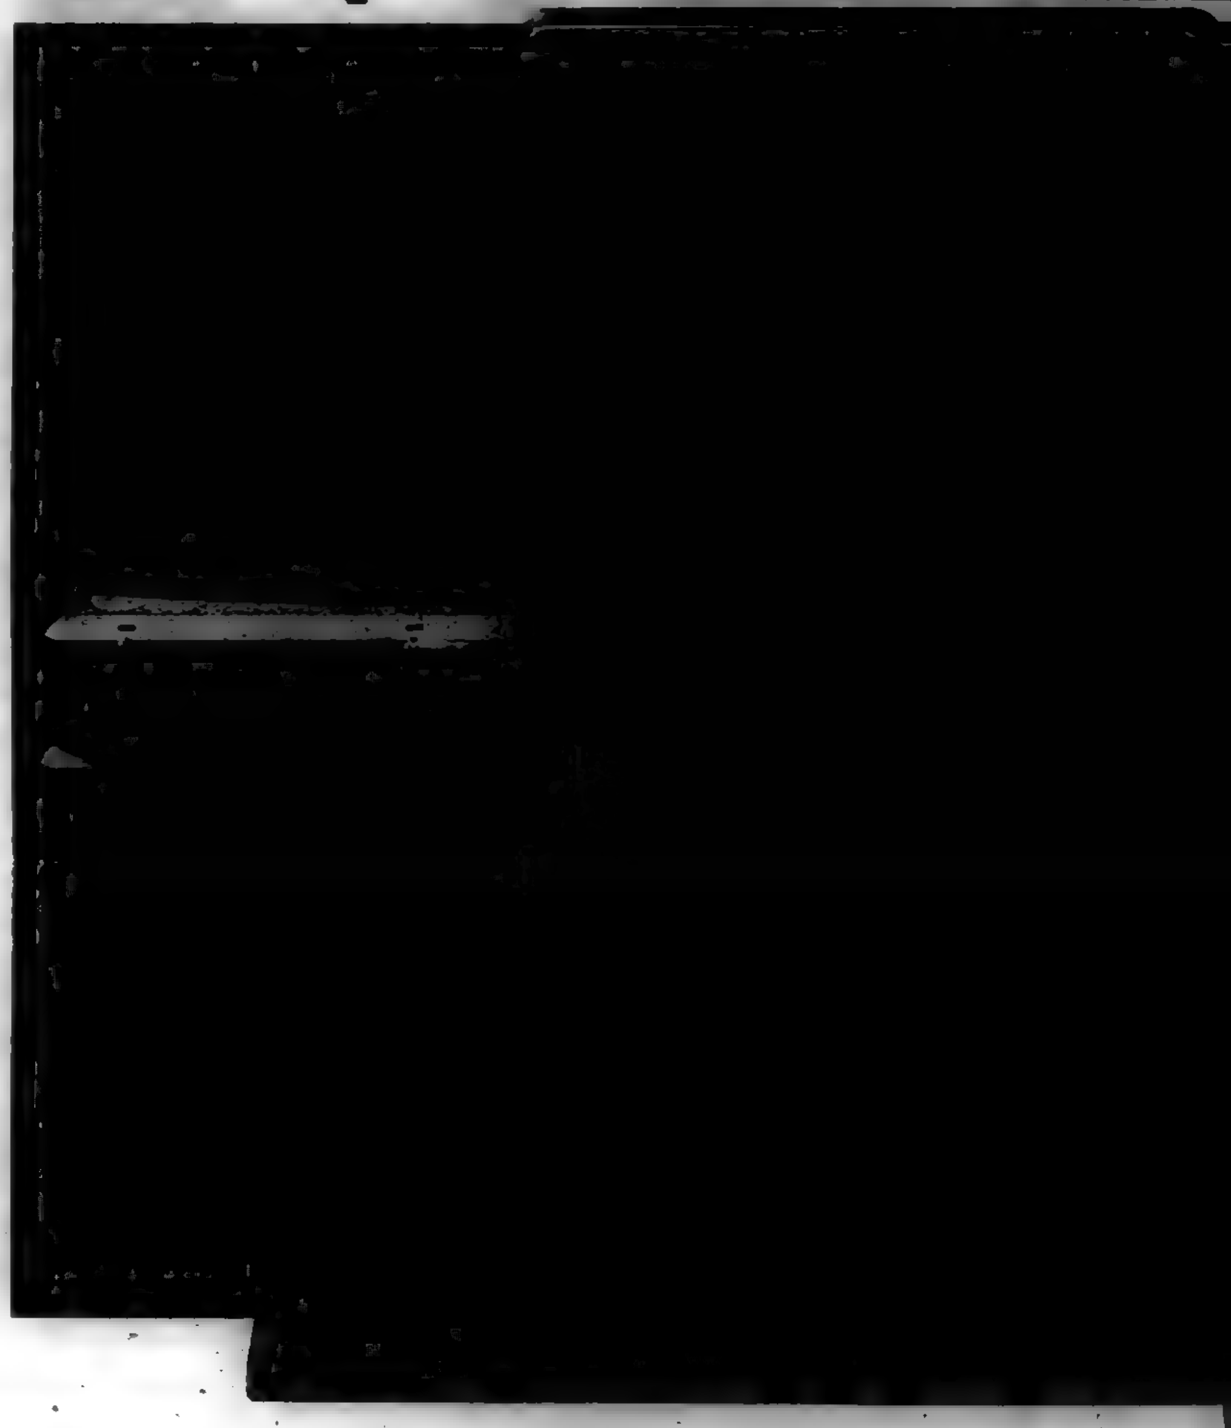
IBM Personal Computers store data on 5¼-in. floppy disk media, but many other systems use higher capacity 8-in. or more portable 3½-in. media. The first level of diskette compatibility is easy to determine — whether both systems can read diskettes of the same size.

Because PC-DOS is a variation of MS-DOS, both systems use the same Ascii code set and organize records in a similar manner, which is reflected in the diskette records. Headers, trailers, record delimiters and so on are common to both systems, and the same basic instruction types are used to manipulate files.

PC-DOS and MS-DOS have comparable features for user manipulation of files, tracks and sectors. A notable difference is that the IBM Personal Computer stores elements of the Basic I/O system, including most of the disk handling logic, in a proprietary ROM. This ROM's functions must be duplicated, preserving the same entry points without duplicating the IBM codes exactly — a tricky but not impossible proposition.

Because the read/write operations for the diskette drives were designed to be firmware- and software-controlled and are accessible to the user, it is possible to manipulate the recording format and density to some extent without sacrificing compatibility. In fact, IBM itself has done so. Under DOS 1.1, diskettes are formatted at eight sectors per track, 40

INTELL



tracks per side, whereas under DOS 2.X and 3.X there are nine sectors per track.

In all cases, 128K-, 512K or 1,024K bytes can be set as the sector size, with the result that diskettes recorded under DOS 2.X and 3.X can have a capacity of 360K bytes, whereas DOS 1.1 diskettes have a maximum of only 320K bytes. DOS 2.X and 3.X were designed to recognize automatically how the diskette has been formatted and to read it accordingly.

The 80186-based Pronto 16 MS-DOS system attaches disk drives designed to record 5¼-in. diskettes at twice the number of tracks per inch as the IBM personal computers. Instead of the 48-track/in. Personal Computer spacing with 40 tracks for recording data, the Pronto 16 was designed to record at a 96-track/in. spacing with 80 tracks for recording data.

The controller identifies the 96 track/in. recording as a double-density mode and can also record in a single-density, 48 track/in. mode. By skipping the odd-numbered tracks, the controller can read or write in compatible format, and the manufacturer can provide twice the capacity without sacrificing IBM media compatibility. The Pronto 16 user can read IBM diskettes without difficulty, all other things being equal, and can write equally compatible diskettes by using single-density mode. However, if the double-density mode is used, that diskette cannot be read into an IBM system — it will have to be copied onto two single-density diskettes.

Each diskette and disk contains a directory of its contents. The logic for control of the directories is included in generic MS-DOS-Bios, but with PC-DOS, most of it resides in IBM's proprietary Bios ROM. DOS 1.1, equivalent to MS-DOS 1.25, was oriented toward systems with diskette storage but no hard disk. Diskette files were accessed through a single directory, an adequate access structure for that medium.

On the other hand, PC-DOS 2.0 and higher, as well as their MS-DOS counterparts, supply a combined partitioning and hierarchical-free structure for disk access. The partitioning allows a disk to be divided among multiple operating systems. The tree structure provides for multiple subdirectories, and it can define a variety of access paths through the directories. This routing mechanism allows a sharing of common code and data (with some limitations) and a flexible upper limit to the virtual partition size created by the path.

Unfortunately, software for PC-DOS 1.1 that has not been updated to support the hard disk won't recognize pointers that lead to subdirectories. The program often can run on the hard disk but must use the single-level type of directory, which is usually unwieldy for a storage medium the size of the fixed disk.

PC-DOS 2.0 and higher can run on diskette-based systems using the ROM chip originally delivered for the Personal Computer. However, if an expansion unit with hard disk is added to the system, one of the elements of the installation package is a new ROM chip with the fixed disk driver on it. A user could buy the expansion box fixed disk and plug it into a compatible system, but it wouldn't work unless it was running under the newer IBM-supplied chip. Third-party vendors still supply fixed disks with software drivers that run in conjunction with the original Personal Computer ROM chip rather than the new one.

Preliminary assessment

The micro user is faced with a marketplace that has not yet developed comprehensive, clear-cut standards — or even traditions that serve as substitutes for formal standards. In some cases, however, de facto standards have been formalized because of widespread implementation. For example, most systems have a standard RS-232C interface and a Centronics Data Computer Corp.-compatible parallel printer port. On the other hand, CP/M, MS-DOS and Unix may be highly portable, but their implementation is hardly standardized.

If they are to stay in business, compatible vendors at any level of the market must offer the user price advantages and equivalent or better reliability vs. the Personal Computer. And the most successful usually offer more prompt delivery and more responsive service as well.

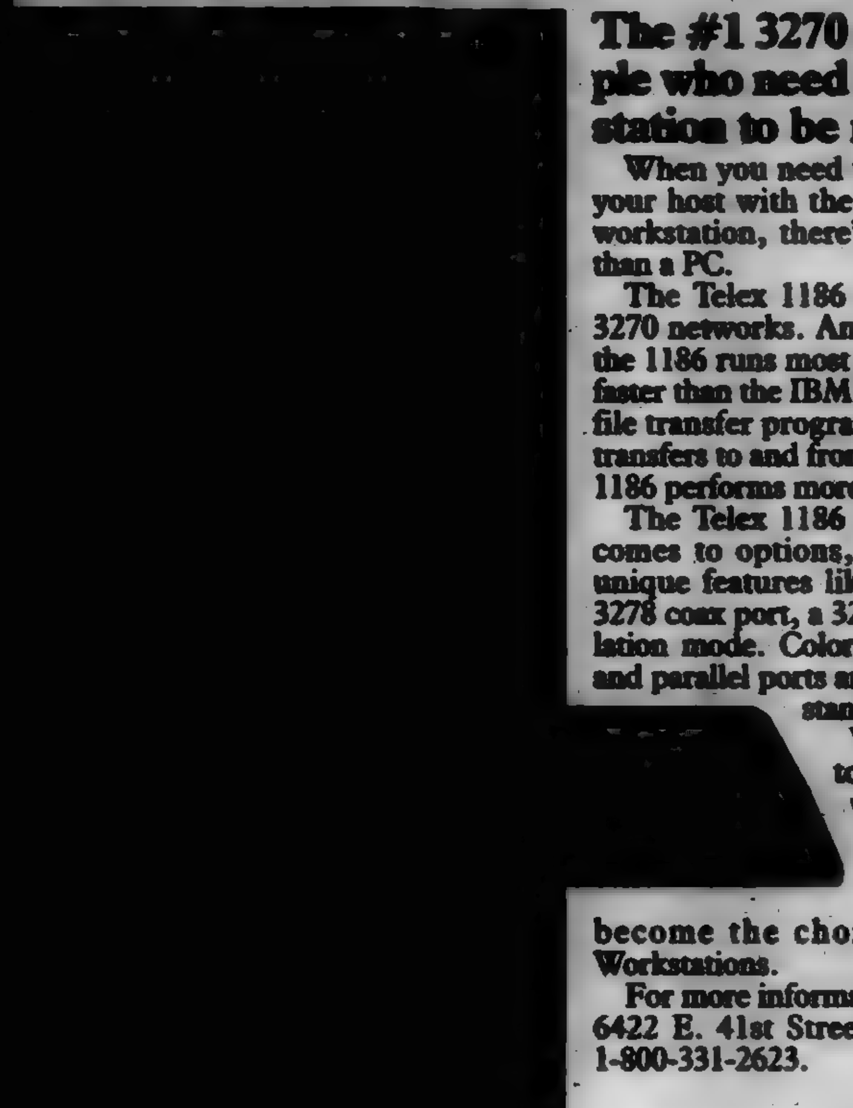
Compatible vendors must establish an identity for their product, so they offer additional attractions. Some features do not affect compatibility; others might. The following discussion of typical enhancements focuses on their impact on compatibility:

Portability or other physical packaging alterations. A number of vendors offer portable systems complete with display, diskette drives, keyboard and system unit. Portability doesn't have to affect compatibility at all, nor does any other alteration to the physical housing.

Improved ergonometric display design. The background, color and manipulative characteristics of the display, as well as nonglare features and physical size of the screen, do not affect compatibility.

Increased resolution of display. The display resolution can be improved by increasing the number of picture elements (pixels) per square inch, which makes alphabetic and numeric character shapes clearer and more distinct. Unfortunately, this enhancement can and usually does affect compatibility. However, if the change involves a fixed formula that automatically changes IBM's 640- by 200-point addressable graphics matrix (into a 1,280- by 400- or 1,280- by 600-point matrix, for example), it can be manipulated. This distinction is an important factor when evaluating compatibility.

LIGENCE



The #1 3270 alternative for people who need an intelligent workstation to be more than a PC.

When you need to combine the resources of your host with the flexible processing of your workstation, there's a more intelligent choice than a PC.

The Telex 1186 is specifically designed for 3270 networks. And while it's PC compatible, the 1186 runs most programs two to three times faster than the IBM PC. Plus, Telex's host-based file transfer programs support high-speed data transfers to and from the mainframe. In fact, the 1186 performs more like an AT than a PC.

The Telex 1186 is more than a PC when it comes to options, too. Because Telex offers unique features like a 3270-style keyboard, a 3278 coax port, a 3276 port and a 3270 PC emulation mode. Color graphics capabilities, serial and parallel ports and date/time functions are all standard features on the 1186.

When you put all of this together with our on-site service option and over 2,000 Telex-dedicated service and support people worldwide, it's no wonder Telex has become the choice for 3270 Intelligent Workstations.

For more information, contact John Hawkins, 6422 E. 41st Street, Tulsa, Oklahoma 74135/ 1-800-331-2623.

The #1
3270 Alternative
TELEX.
TELEX COMPUTER PRODUCTS, INC.

Increasing CPU clock speed. This practice is fairly common and only creates problems for time-dependent programs.

Increased memory capacity. Increasing the memory in the basic system doesn't change the compatibility of a vendor's product, but increasing memory beyond IBM's limit might do so. The Personal Computer allows addressing up to 1M byte, but some of those addresses are used for system functions that are not supposed to be accessed directly by the user. The 640K-byte Personal Computer limit for user memory is large enough for a single-user/single-tasking system, and most alternative vendors do not exceed it.

Increasing diskette capacity. The Personal Computer line handles 160K, 320K or 360K bytes of diskette capacity, depending on the drive model and operating system release. In almost all cases, any change in diskette size, capacity, file handling, formatting or directories will affect media compatibility. The exception is when a drive and its supporting software are engineered to read and write Personal Computer densities as well as the larger density.

Changes in keyboard design. Changes in a keyboard's physical characteristics, such as touch sensitivity, shape of keyboard top, color coding of key caps, positioning of keys and movability and tiltability of the keyboard unit, do not affect compatibility. Adding function keys may or may not affect compatibility and probably won't because they are entered into the system by a two-level process that lets the user manipulate the software and translate the keyboard input into standard system instructions.

Adding to the number of slots, RS-232C or parallel printer ports. In and of themselves, these changes do not create problems, provided the devices can be addressed. However, there may be problems with the software that directly addresses machine elements.

Combining logic cards. Many compatible vendors provide a display control card that combines the functions of the monochrome and graphics display control cards, which are separate for all Personal Computer systems except the 3270 PC. This doesn't affect compatibility and saves I/O slot positions; in fact, this compaction is a favorite device of vendors competing with IBM.

Implementing a RAM disk. PC-DOS 2.0 and higher and MS-DOS 2.0 and higher implement a RAM disk, but PC-DOS 1.1 and MS-DOS 1.25 do not. Certain compatible vendors include RAM disk capability in their version of MS-DOS 1.25. This addition may or may not affect compatibility with programs designed to run under PC-DOS 1.1; in the case of Columbia Data Products and Corona systems, for instance, it does not.

Current compatibility

Users and industry analysts tend to divide the compatibles marketplace into three broad divisions and assume that the systems run some version of MS-DOS and are based on an 8088, 8086, 80186 or other compatible member of the Intel 8088 family of microprocessors. These divisions are MS-DOS compatible only, disk/data compatible and Personal Computer compatible.

MS-DOS compatible only. This

Box 70, Douglas, Isle of Man, (051) 628356

broad group of systems runs MS-DOS, but there is no particular effort to be compatible. Certain programs that run on the Personal Computer can run on these systems because they use only the code common to MS-DOS and PC-DOS — in other words, they are highly device-independent. They will not directly address ROM, for example, and usually do not use graphics.

Because certain Personal Computer programs do run on the system, the vendor may claim some compatibility. Usually, however, the specifications for these systems show differences in diskette media size or capacity, differences in graphics pixels, a different keyboard or different character capacity and format on displays. These systems do not attach IBM peripheral cards; if these vendors were interested in that degree of compatibility, they would have included disk/data compatibility — which is easier to implement.

This level of compatibility has been labeled MS-DOS compatible or incompatible. Only a stray manufacturer or two calls the system compatible because most manufacturers of this type of system see a marketing advantage in having a distinct identity. These vendors will usually say that their product is not a "me-too" product.

Disk/data compatible. The second large group of systems can read and write disks in the format used by the Personal Computer and use the same physical size diskette. They will produce 5¼-in. diskettes with a capacity of 160K, 320K or 360K bytes depending on the MS-DOS version implemented and whether or not the diskette is single- or double-sided. Sectoring will be the same. Headers, trailers and directories also will be the same, with the qualification that certain compatibility problems will arise among diskettes with multiple subdirectories recorded under MS-DOS 2.0/3.0 or PC-DOS 2.X/3.X and single directories recorded under MS-DOS 1.25 or PC-DOS 1.1.

This level of compatibility has been labeled disk compatible, data compatible or media compatible and, of course, Personal Computer compatible. It is a level that is fairly easy to implement because the basic software structures are already in place in MS-DOS. The manufacturer only needs to add a 5¼-in. diskette drive and some coding to implement it in addition to features already on the system.

Personal Computer-compatible systems. Systems that are fully or almost fully compatible with existing hardware and software include the ability to attach Personal Computer expansion boards and run Personal Computer software. The keyboard may be identical as well as compatible; the disk is compatible; the system runs most nongraphics and some graphics software; it usually can run interpretive Basic with graphics as well as compiled Basic; and it can run all versions of PC-DOS. If the system doesn't quite meet these standards, the point of variance usually is with the graphics capabilities and the ability to run interpretive Basic with graphics. Systems with this level of compatibility have been labled system compatible, operationally compatible, truly compatible and naturally Personal Computer compatible.

Clearly, PC-DOS has a lot of capability for supporting machine-dependent features, and even the most compatible system could hang up on a program that directly calls ROM — even if the compatible system has all ROM entry points at the same locations as IBM's. It is also possible for a compatible vendor to design ROM code to function like the Personal Computer ROM code without violating IBM copyrights.

The Compaq Portable, the first compatible to achieve a sizable installed base, is considered the compatibility standard. Corona Data Systems, another veteran in this market, has also achieved excellent marks on compatibility. The Corona system has incompatible graphics features but can operate in a fully compatible graphics mode if the IBM graphics board is installed.

Wang Laboratories, Inc. recently announced four desktop machines offering software compatibility with the IBM Personal Computer [CW, May 13]. The models add IBM monochrome display emulation capability to standard Wang Professional Computer configurations. The desktops feature an 8086 processor, 256K bytes of RAM, MS-DOS 2.1 and Basic. Expansion slots are compatible with Wang's Professional Computer. Wang also announced an IBM Personal Computer color and graphics emulation option and an Intel 8087-2 numeric coprocessor.

Word of caution

Whenever we talk about compatibility, we include MS-DOS systems that are disk/data compatible and those that can attach Personal Computer boards. Both these levels can run more Personal Computer software than systems supporting MS-DOS compatibility. Compaq, the system generally accepted as the most compatible, runs PC-DOS and IBM-supplied systems software.

However, it would be wise to test every program, even on a Compaq.

The two favorite testing vehicles are Microsoft's Flight Simulator and Lotus Development Corp.'s 1-2-3.

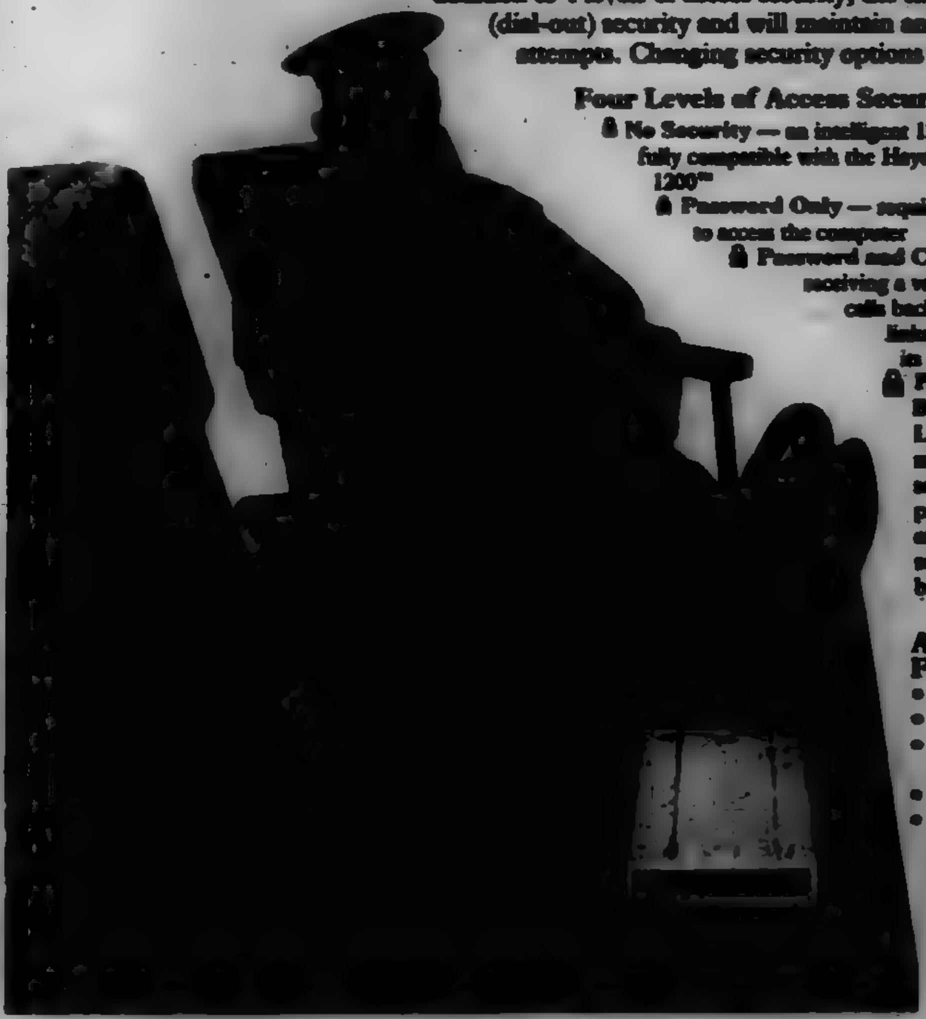
REST ASSURED
THE CERMETEK SECURITY MODEM
IS ON THE JOB!

Don't lose sleep worrying about an unattended computer. The CERMETEK SECURITY MODEM is the best guard for the job.

Communication and Security for only $695 is an unbeatable buy! The Security Modem offers a variety of security options to fit your specific needs. In addition to 4 levels of access security, the modem has originate (dial-out) security and will maintain an audit trail of all access attempts. Changing security options or codes requires a key.



Four Levels of Access Security

- No Security — an intelligent 1200/300/110 bps modem, fully compatible with the Hayes SMARTMODEM 1200™
- Password Only — requires a valid 8 digit password to access the computer
- Password and Call-Back — After receiving a valid password, the modem calls back to the phone number linked to that password in its memory.
- Password and Call-Back on Second Security Line — The modem can make the call-back call on a second secret phone line, preventing the interception of the call-back by a sophisticated security breaker.

Additional Modem Features

- 2 year limited warranty
- Auto-dial, auto-answer
- synchronous as well as asynchronous
- call progress monitoring
- 41 auto-dial numbers stored, 25 for call-back numbers in security mode

"Communication for your computer, Security for your peace of mind."

Take this ad to your favorite computer dealer and ask for the CERMETEK SECURITY MODEM.

Introduce Your Database To Intelligence Of A Higher Order.

The intelligence we speak of isn't science fiction. It's science fact.

In fact, it's the Information Expert™ from Management Science America, Inc. The fourth generation technology that not only recognizes the limitations of database vendors but addresses them.

For example, Information Expert allows all your software systems to work in a completely new manner. Together. In unison. In seconds. Whether it's with existing software or new software.

But not only will we put your systems on speaking terms, they'll be speaking the same language. English (or any local language input you use). There's even a data dictionary so nothing will ever sound like Greek.

If it appears we're saying end users will find our system easy to use for designing reports, we are. Our menus guide you through the process with such ease and intelligence, they'll even tell you the proper responses to use for whatever job you need.

Information Expert also provides fourth generation language that your data processing staff can use for applications development. What's more, it's more efficient and easier to use than COBOL. So you can do in minutes what used to take hours. Or do in hours what used to take days.

Then, to speed things up even more, our system ignores all boundaries and allows borderless retrieval of information. That way, you can get all the information you need. Not all the information you don't need.

All of which proves one thing. If you want more intelligent software, go to a more intelligent software company. MSA. For more information, call Robert Carpenter at 1-404-239-2000.

MSA SOFTWARE

Intelligence Of A Higher Order.™

In August, 128,000 MIS/DP executives can stop saying *"What we have here is a failure to communicate."*

There's a world full of computers out there. And everyone's trying to make them talk to each other.

The trouble is, there are so many technologies, so many products, so many promises, MIS/DP management isn't sure which way to turn.

In the August 28th issue of *Computerworld Focus* on Networks, we'll help them cut through all the smoke with a complete issue devoted to the topic of networking. Which gives you an ideal advertising forum if you've got a relevant product, service or strategy. Because you'll be surrounded by truly topical, informative editorial.

We'll take a look at LANs, PBXs and long-haul satellite technologies, as well as packet networks and teleconferencing. We'll call on experienced users to give us accounts of their own trials-by-fire. We'll ask industry experts to evaluate future directions and advise on the paths that are most likely to be successful for users. And we'll evaluate the products and strategies designed to link desks and offices and buildings and cities into a single integrated system.

So if you want to reach Computerworld's 128,000 paid subscribers, plus bonus distribution at important Fall '85 trade shows, the answer is simple. Get your ads in focus. *Computerworld Focus.* **The August 28th issue. But hurry, closing is July 19th.**

SOFTWARE & SERVICES

SQL users give mixed reviews

By John Gallant
CW Staff

NEWBURY, England — Overall, users gave high marks to IBM's SQL relational query system, but they questioned its usefulness to non-DP professionals — the very audience to which IBM targets the product.

That was the finding of a recent Xephon Technology Transfer Ltd. study of SQL users at 37 U.S. sites. According to Xephon, headquartered here, SQL is most commonly used by applications programmers and least used by senior managers. Many respondents commented on end-user difficulties encountered when using SQL.

"IBM aims its relational query system squarely at non-DP professionals — DP professionals are not listed among the primary users suggested for SQL in IBM's "Systems and Products Guide," Xephon stated. "But [the survey] casts some doubt on the package's suitability for end users without DP training."

In addition, the survey indicated, SQL performance was a problem for users, particularly terminal response time and processor overhead. Users cited faster systems development as the primary benefit of SQL use, and they listed its lower cost, compared with functionally similar products, and reliability as top benefits.

Xephon also asked users to list the factors that influenced their selection of SQL. The most commonly expressed factor was that SQL is an IBM product, benefiting from Big Blue's "strength, support and di-

What do programmers, engineers and certain athletes have in common?

According to J. Daniel Couger, they are intensely individualistic, thrive on challenge, have a lower need for social interaction and are motivated by their work rather than such factors as pay, fringe benefits or job security. But despite their solitary, self-motivated nature, they are usually required to work within a team structure.

Couger, distinguished professor of computer and management science at the University of Colorado at Colorado Springs, is involved in research into the workings of programming teams and the hazards that befall them.

"Professionally, engineering is the closest thing to programming," Couger said "In athletics, the equivalent to the programming

Will the real fourth-generation languages please stand up?

Has the era of fourth-generation languages already arrived, or is it just approaching?

A critical look at the evolution of programming languages shows that first-generation software supported sequential processing of one instruction at a time. Today, software supports sequential instruction-by-instruction processing but at a much faster rate than 10 or 15 years ago.

First-generation software came into existence in the late 1950s and early '60s. It was characterized by machine-oriented languages and assembly languages such as Basic Assembly Language.

Second-generation languages, which became popular in the early 1960s, can be described as compiled programs that run using a command language. For example, early versions of Fortran were dependent on JCL for the IBM 360.

Third-generation languages with data abstraction capabilities and control of asynchronous processes also arrived during the early '60s. These languages included Cobol, PL/1 and Pascal.

Each generation of languages has improved on the ease of use and capabilities of its predecessors. Since the third generation, generation 3.5 languages

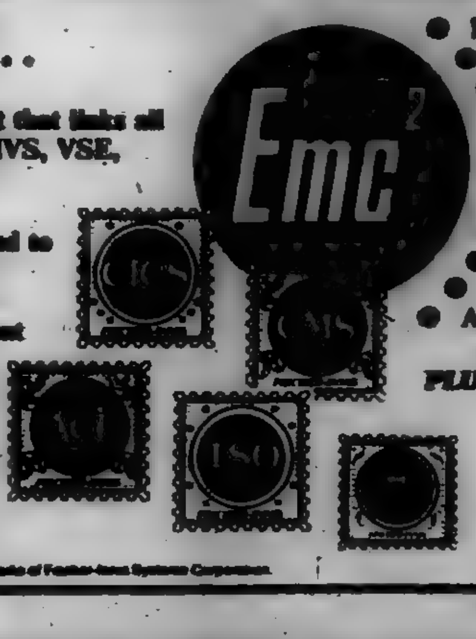
ELECTRONIC MAIL COMMUNICATION CENTER

Lightyears Ahead . . .

The ONE electronic mail product that links all major operating environments: MVS, VSE, VM, CMS, CICS, TSO, ACF...

Emc² is easy to use. It's designed to get the mail moving *fast*.

Emc² functions as a super-efficient ACF/VTAM application. This allows literally thousands of people in your company to use mail without needing TSO, CICS, or CMS user IDs!



- Full-screen menus and help panels
- Scrollable inbaskets and outbaskets
- Uncomplicated text entry
- Mailing lists
- Bulletin boards
- Calendar features
- Timely Reminders "tickler file" (arrange for messages to be sent at some future date)
- Automatic new-mail notification
- Mail classes (partition Emc² into virtually separate mail systems)
- Efficient data base storage
- Simple installation
- Low administrative overhead
- Application programming interface

PLUS
- Electronic mail *networking* between mainframe sites
- *Integrated PC support* and integrated PC file transfer

CDBC unveils link tool for IBM micros

GREENWICH, Conn. — Control Data Business Centers, Inc. (CDBC) has announced microcomputer-mainframe link software that gives remote personal computer users access to accounting and financial applications running on CDBC's mainframes.

Dubbed Orchestrator, the software gives IBM Personal Computer AT and XT users a two-way link to CDBC's mainframes running payroll, accounts receivable and payable and general ledger systems. Orchestrator reportedly provides user companies with a common data base that can be accessed by different departments through micros. Applications of Orchestrator include payroll processing, payroll tax filing, automatic tax changes and benefits administration.

Orchestrator consists of a telecommunications program, user security software, four data entry modules, automatic file translation, backup and restoration programs, printer support software and report backup, restoration and deletion. It requires 320K bytes of random-access memory and an RS-232 serial port. It comes with four 5¼-in. diskettes that work under IBM's PC-DOS 2.0. Telephone hookup requires a 1,200 bit/sec. asynchronous modem with autodial capabilities.

The spokesman said the product can be used to communicate with CDBC mainframes at any time of the day and transmits and disconnects automatically.

The menu-driven software automatically edits entered data, the spokesman said. Data is available after processing by the host for downloading, storage and manipulation in the micro. Processed work, including reports and payroll checks, reportedly is available the next day.

Orchestrator is available through two basic options: a one-time license fee of $3,600 or a monthly payment of $150. CDBC also charges a software maintenance fee of $35 per month. Host processing rates vary, based on volume of processing.

CDBC can be reached through P.O. Box 7100, 600 W. Putnam Ave., Greenwich, Conn. 06836.

DEC systems get Formatix

PARMINGDALE, N.Y. — Iskra Software International has introduced an applications generator for Digital Equipment Corp.'s VAX and PDP-11 processors.

Formatix generates documentation as it develops the application, a spokesman said. The menu function allows users to combine programs generated by Formatix with programs written in other languages.

Users can begin application generation by describing the features they need generated. Menus can be formed to create, review, update, generate reports, make inquiries and provide help.

Formatix is priced from $1,700 on DEC's Microvax to $9,900 on the VAX-11/780.

Iskra Software International is located at 222 Sherwood Ave., Farmingdale, N.Y. 11735.

Linkware versions debut for MVS, Unix

WALTHAM, Mass. — Linkware Corp. has announced that its micro-mainframe software now runs under IBM's MVS/TSO and the University of California at Berkeley's Unix operating systems. The company also announced Version 1.5 of its PC Connection product.

The Linkware Information Server, formerly available for IBM VM and Digital Equipment Corp.'s VMS operating systems, includes Linkware's data transformation facilities that transform host files into personal computer formats, according to a spokesman.

The MVS and Unix versions of Linkware Information Server each include command line interfaces to allow host-terminal users to exchange files via Linkware's Central Server with dissimilar personal computers.

A security facility allows management to control user access privileges and generates an audit trail of user requests to Linkware, the spokesman said.

The MVS/TSO version of the Linkware Information Server costs $35,000 per CPU. Unix versions range from $6,000 to $18,000, depending on configuration.

Linkware's PC Connection Version 1.5 is now available for Data General Corp.'s DG/One and Wang Laboratories, Inc.'s Wang Professional Computer.

The product, formerly available for the DEC Rainbow and IBM Personal Computer and compatible machines, automatically reformats information being transferred between the mainframe and microcomputer. Logon features have also been enhanced, the vendor said.

Linkware's PC Connection costs $10,000 for each make of hardware running it.

Linkware is located at 77 Rumford Ave., Waltham, Mass. 02154.

SYSTEMS SOFTWARE

■ Datamate Co. has announced that its Fastfile data base system is now available for users of NCR Corp.'s Imos 3 and Imos 5 operating systems. The product had been available for users of NCR's IRX, ITX and RM/COS systems.

Fastfile allows users to set up information storage and retrieval systems in minutes. The product uses precompiled code to allow the user to set up a customer filing system by responding to menu prompts.

From a central menu, Fastfile allows users to create up to 32 data bases, which look like standard Cobol applications, a spokesman said. Data retrieval is carried out by a customized version of the firm's Enquery English-language report writer.

According to the vendor, Fastfile is priced at $1,995 on all NCR I series computers. Prior to Sept. 30, the product is priced at $1,495. Enquery is included with the system.

Datamate, Suite 128, 4135 S. 100th East Ave., Tulsa, Okla. 74146.

■ An integrated forms facility, support for Digital Equipment Corp. VAX clusters and a tools library have been added to Version 4.0 of Software House, Inc.'s System 1032 data base management system.

The System 1032 forms facility reportedly simplifies data input and display. Automatic layout produces forms directly from data set definitions. Fields and prompts are aligned in vertical columns, and centered headers and boxes indicate data groups.

An automatic applications generator reportedly develops prototype screen-based applications using the system's fourth-generation language.

The 1032 Vaxcluster software selects between the VAX/VMS Distributed Lock Manager and an internal lock management module, the vendor said. A tools library includes data base utilities as well as Help facilities.

System 1032 Version 4.0 is priced from $8,000 for the DEC Microvax I to $60,000 for the VAX 8600.

Software House, 1105 Massachusetts Ave., Cambridge, Mass. 02138.

■ Sir, Inc. has added a graphics component to the Digital Equipment Corp. VAX version of its Sir/DBMS relational data base management system.

The graphics component, Graph, allows users to create business charts and graphs and create subsets of a larger data base on a table file. With Sir's SQL+ query language, users are able to manipulate and format data, generate histograms, bar charts and pie charts, as well as graphs and store the data for later use, the vendor said.

Graph is compatible with more than 70 graphics devices and can use any charting capabilities provided by the user's hardware.

Reportedly, Sir/DBMS is available on a variety of hardware and operating systems ranging from AT&T Unix-based supermicros to mainframes.

Prices for Sir/DBMS range from $10,000 to $75,000, depending on the hardware that is used, Sir said.

Sir, 5215 Old Orchard Road, Skokie, Ill. 60077.

■ Boole & Babbage, Inc. has announced Dasd Response Manager, an on-line tool for direct-access storage device subsystem analysis with I/O service-measuring capability. The product is available for IBM MVS/370 and MVS/XA environments.

Dasd Response Manager supplies management and technical users with information to control and improve Dasd response time, tune the Dasd subsystem, determine the best use of added Dasd and evaluate the impact of configuration and work load changes on response time.

At the system level, users can view Dasd service time and individual service time components. When contention is resolved, system summary reports verify the improved service. Node and path reports can be

Future Software releases spreadsheet for IBM CPUs

SALT LAKE CITY — Future Software, Inc. has announced Future-Calc, a spreadsheet application for multiuser IBM mainframe environments. The product is a component of the company's Future-System fourth-generation language and application development system.

Reportedly, Future-Calc allows spreadsheet models to be run in seconds and permits users to access existing files and data bases interactively and move data. The product includes capabilities for systemwide sharing of spreadsheet models.

The product features modularity, which allows any spreadsheet to be used simultaneously in any spreadsheet model by any number of users. Future-Calc spreadsheets can be attached or removed at any time.

Future-Calc runs on IBM mainframes under CICS and TSO. Spreadsheets created under TSO can be run under CICS and vice versa.

The DOS/CICS version of Future-Calc costs $12,000. The OS1/MVS/CICS and TSO versions are each priced at $15,000.

Future Software is located in Suite 9, 2525 S. Main St., Salt Lake City, Utah 84115.

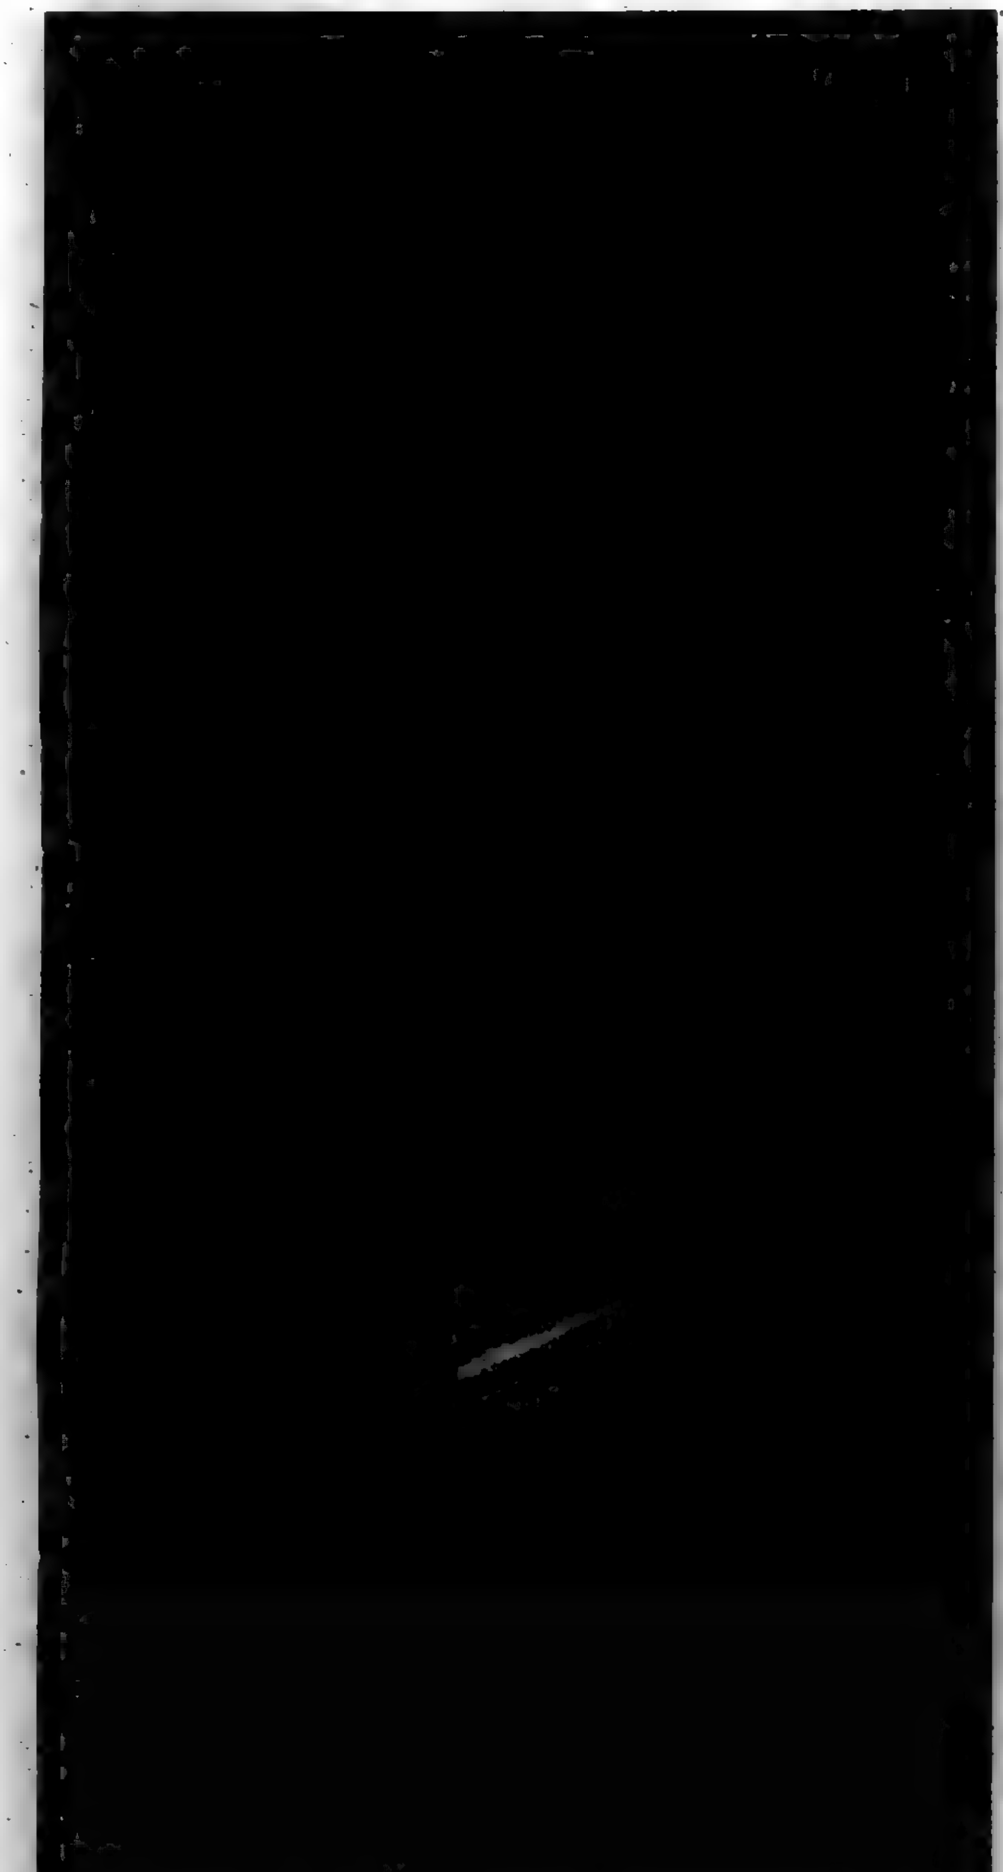
Announcing Version [illegible]

[illegible]



Has your software investment turned into an unmanageable maze?

Peat Marwick's PATHVU™ can analyze your software, find the problems and report them. Then we can fix them.

You have a huge investment in your business software. To make that investment pay off at its maximum effectiveness you must really know how well it's functioning right now. That's why Peat Marwick developed PATHVU.

Designed specifically for IBM, COBOL Systems, PATHVU gives you a quick, precise statistical measure of your software library which you can produce as often as you need it. It identifies a variety of problems such as violations of company software standards. And tells you about them in two readable reports: both technical and in lay terms for management. PATHVU helps facilitate software investment decisions now. It also helps you maintain the best possible systems in the future.

And, because we're Peat Marwick, our follow-up is superb. Once your PATHVU system is in place we will provide you with ongoing consultations to help you develop software management strategies based on facts. To help you get the most out of the software you have without costly, traumatic system replacement.

PATHVU has been proven in use by more than 100 companies, and 100 million lines of code. For more information on PATHVU, send in the coupon or call 800-344-3600 (in Illinois, call 800-328-4200).

generated at any point in the Daad subsystem, the vendor said.

Prices for Daad Response Manager start at $11,000 for MVS/370 and $16,500 for MVS/XA systems.

Boole & Babbage, 510 Oakmead Pkwy., Sunnyvale, Calif. 94086.

■ Mt Xinu has announced that its Network File System (NFS) is now available for Digital Equipment Corp. VAX superminicomputers running systems software based on the University of California at Berkeley's Unix 4.2 operating system.

The NFS allows transparent sharing of files, peripheral resources and utilities. It was developed by Sun Microsystems, Inc. and has been licensed by Mt Xinu for marketing.

NFS increases the capabilities of networks by creating a distributed file system, a spokesman said. To access files with standard Unix networking tools, a user must know where the file is located on the network. With NFS, the collection of public files on various systems appears as one local file.

NFS is machine and operating system independent.

Mt Xinu provides NFS for VAXs either as an addition to its More/BSD Berkeley Unix 4.2-based binary system software or as a set of linkable binary modules for sites running Berkely 4.2 source code.

NSF as an add-on for the DEC VAX-11/750 costs $4,000.

Mt Xinu, Suite 150, 2910 Seventh St., Berkeley, Calif. 94710.

PRODUCTIVITY AIDS

■ Henco Software, Inc. has announced the availability of its Info fourth-generation applications development software for the recently announced Digital Equipment Corp. Microvax II processor.

Info incorporates data entry, data updating, document retrieval and text management, a query facility and a report writing system with computation capabilities.

Info on the Microvax II costs $8,600.

Henco Software, 100 Fifth Ave., Waltham, Mass. 02154.

■ Systems & Software, Inc. has announced XPC-86 for development of software that runs on IBM Personal Computers and compatibles. XPC-86 operates on Digital Equipment Corp. VAX machines running VMS or DEC's version of AT&T's Unix operating system.

The program also operates on any Motorola, Inc. 68000-based processor running Unix.

According to a spokesman, the XPC-86 cross-development package includes an optimized C-86 cross-compiler that supports a range of memory models, a runtime library for Microsoft, Corp.'s MS-DOS environment, an Intel Corp. ASM-86/87/186-compatible macro assembler with Intel 8087 numerical coprocessor support, a library manager and a linker that produces executable files in an MS-DOS-compatible format.

The XPC-86 package also includes a communications software module that allows Ascii and binary files to be transferred between the personal computer and its host. The communications package provides DEC VT100 terminal emulation.

Available immediately, the XPC-86 is priced at $9,950 for the DEC VAX and $6,750 for the Motorola 68000-based machines running Unix.

Systems & Software, Suite C-11, 3303 Harbor Blvd., Costa Mesa, Calif. 92626.

APPLICATION PACKAGES

■ Logicraft, Inc. has announced an enhancement to its Cardware software that allows graphics generated on an IBM Personal Computer to be displayed on Digital Equipment Corp. VT240 or Tektronix, Inc. 4010 terminals linked to DEC minis.

The Cardware graphics display package runs on DEC minis equipped with the Cardware board. The board converts IBM PC-DOS programs into a format compatible with the DEC VMS operating system.

The package is said to support both the 320- by 200-pixel and 640- by 200-pixel graphics modes used by Personal Computer applications programs.

The package costs $200 for an individual user license and $1,500 for a site license.

Logicraft, 3 Graham Drive, Nashua, N.H. 03060.

■ Rockkind Software Corp. has announced AT&T Unix versions of its Ride programming language for Digital Equipment Corp.'s VAX line, AT&T's 3B2 supermicros and Unix Personal Computer and Tandy Corp.'s Model 16 and TRS-6000.

Ride also runs under Microsoft Corp.'s MS-DOS. Ride features data processing functions and data base features, a spokesman said.

Ride for the VAX-11/780 runs under the University of California at Berkeley's Unix 4.2 and costs $1,495. The product runs under AT&T's Unix System V for AT&T's Unix Personal Computer and 3B2. Ride for Tandy's Model 16 and TRS-6000 computer runs under Microsoft's Xenix. Unix versions of Ride for Tandy and AT&T microcomputers sell for $495.

Rockkind Software, 3080 Valmont Road, Boulder, Colo. 80301.

■ Sperry Corp. has announced the Municipal Financial System (MFS),

Eighth Saudi Arabian National Computer Conference & Exhibition

ARAMCO is proud to announce that it will host the Eighth Saudi Arabian National Computer Conference and Exhibition in Al-Khobar, Saudi Arabia, October 1–7, 1985. This is a continuation of national computer conferences held in Saudi Arabia since 1974.

Please forward your reservation to:
CHAIRMAN, Registration Committee
Eighth Saudi Arabian National Computer Conference and Exhibition
ARAMCO P.O.Box 1748, Dhahran 31311, Saudi Arabia. Tlx: 601220 ASAO SJ

For further information, please contact any of the following ARAMCO offices in Saudi Arabia: Dhahran: 876-4078 — Jeddah: 653-4655 — Riyadh: 464-1056

Continued from page 63

based on the Sperry Mapper applications development system, for Sperry System 11 processors.

The menu-driven MFS was developed by Adirondack System Associates in Saratoga Springs, N.Y. Designed for small- to medium-size governments, MFS consists of Municipal Accounting, Municipal Payroll and Municipal Fixed Assets integrated applications packages.

According to a spokesman, the Municipal Accounting package controls and records the processing of purchase orders, invoices, cash receipts and miscellaneous transactions.

The Municipal Payroll package provides for multiple payroll cycles, multiple funds and fiscal periods, exempt and nonexempt employees and calculating payroll from gross to net with labor distribution.

The Municipal Fixed Assets package accounts for all capital assets and will accommodate multiple accounts and multiple funds.

Separately, the accounting package is priced at $46,250, the payroll package at $15,000 and fixed assets at $11,000. Together, the packages are priced at $58,500.

Sperry Information Systems Group, P.O. Box 500, Blue Bell, Pa. 19424.

■ **Marc Software International, Inc. has announced Wordmarc Author and Wordmarc Composer word processing programs for minicomputers.**

Both programs are new versions of the company's Wordmark word processing program introduced in 1981. The programs operate on minicomputers from Digital Equipment Corp., NCR Corp., Hewlett-Packard Co., AT&T, Harris Corp., Prime Computer, Inc. and Apollo Computer, Inc. The programs are also available for microcomputers running Microsoft Corp.'s MS-DOS operating system.

Wordmarc Author is for users concerned with the content of letters. Wordmarc Composer is for users editing complex documents.

Both products are scheduled for September availability. Prices range from $495 for the micro version to $8,900 for the DEC VAX 8600 series.

Marc Software, No. 300, 260 Sheridan Ave., Palo Alto, Calif. 94306.

■ **Environmental Systems Research Institute (Esri) has announced Network, an additional component in the company's ARC/Info geographic information system, which runs on Prime Computer, Inc. and Digital Equipment Corp. processors.**

Network is used to manage geographic networks like city streets, railroads, rivers and utility lines. The program allows users to create, analyze and display the time, space and impedance relationships common to geographic design. Analysis tools include optimum routing, address matching, facility allocation and intersection districting.

Functions that Network performs include parcel address matching, coding of street addresses to street segments and polygons, calculation of address coordinates and selection of optimum path routes.

Network is priced at $15,000, including one year of maintenance.

Esri, 380 New York St., Redlands, Calif. 92373.

■ **Digital Equipment Corp. has announced that Interleaf, Inc.'s composite document processing software is available on DEC's Vaxstation I and Vaxstation II processors under the MicroVMS operating system.**

The Interleaf Workstation Publishing software enables users to prepare and edit documents containing multiple proportionally spaced typefaces, graphics and data-driven business charts.

A mouse or menu-driven interface allows users to access editing and formatting routines needed to produce typeset-quality originals, a spokesman said.

Interleaf Workstation Publishing software will be available this summer through Digital's Classified Software program. It is priced at $3,000.

DEC, 146 Main St., Maynard, Mass. 01754.

■ **Network Solutions, Inc. has announced Maintenance/1, an on-line maintenance system and parts inventory control for fleet vehicles. The product runs on IBM System/36 minicomputers.**

A spokesman said the package can accommodate preventive maintenance scheduling, provide status reports and update repair orders and parts inventory. It can also track costs associated with the ownership of the vehicle. Maintenance/1 consists of six modules, which can be purchased separately or as a package.

The product costs $30,000.

Network Solutions, 401 Jefferson Blvd., Warwick, R.I. 02886.

DATA BASE MANAGEMENT SYSTEMS

■ **BTI Computer Systems, Inc. has introduced a relational data base management system and fourth-generation applications development language for its BTI 8000 32-bit multiprocessor system.**

The Multiple Access Retrieval System II (Mars II) DBMS includes an ad hoc query facility, a user-directed screen formatter and data dictionary. Mars II costs $25,000.

BTI Computer Systems, 870 W. Maude Ave., Sunnyvale, Calif. 94086.

See DBMS page 66

"In one day, we'll show you how to manage your company's information needs for years to come."

James Martin
Author, Lecturer and
Chairman, JMA, Inc.

A one-day consultation with James Martin Associates can offset years of information programs. It can help your people develop the information they need. So they can make important decisions correctly. It can be the first step toward improving response time, making data bases flexible and integrating personal computers.

It's the first step that can help you develop a comprehensive information strategy that reaches into every aspect of your organization. We can provide a total overall insight that unites the functions of data processing departments and the business needs of end-users.

The Information Engineering solution.

We have learned that information management is essentially an engineering problem. The proper methodology and framework ensure a system that works for all who depend upon information. For this reason, we carefully examine the requirements of everyone from top management to mid-level supervisors to programmers. We then place powerful, easy-to-use software tools in the hands of those who need to transform data into useful information.

And, most significantly, you don't have to wait. Instead of platforms and proposals, we give you tools that are available . . . now.

Information Engineering also links and centralizes data bases for optimal efficiency so that you derive maximum potential from your current technology.

In fact, our whole approach makes the most of the systems you currently have. You don't have to start from scratch.

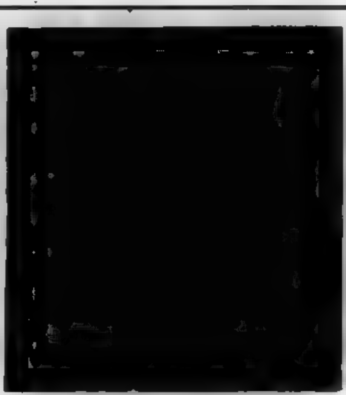
The information strategy approach: All the information you need when you need it.

Information Engineering involves clear-headed logistics so that information moves precisely where it should. Rather than having rooms of programmers, writing in cumbersome languages like COBOL or Fortran, you can have end-users creating their own applications with new fourth-generation software tools. Your hardware assumes the burdensome task of generating code. And your users obtain information in a fraction of the previous time.

Our one-day seminar shows you how.

Information Engineering can revolutionize the way your company processes and distributes information. We'll demonstrate this approach to you at a one-day seminar, conducted at your location for up to fifty people. If you decide to proceed with a consulting agreement, there is no cost or obligation. Just an opportunity to learn from our experts.

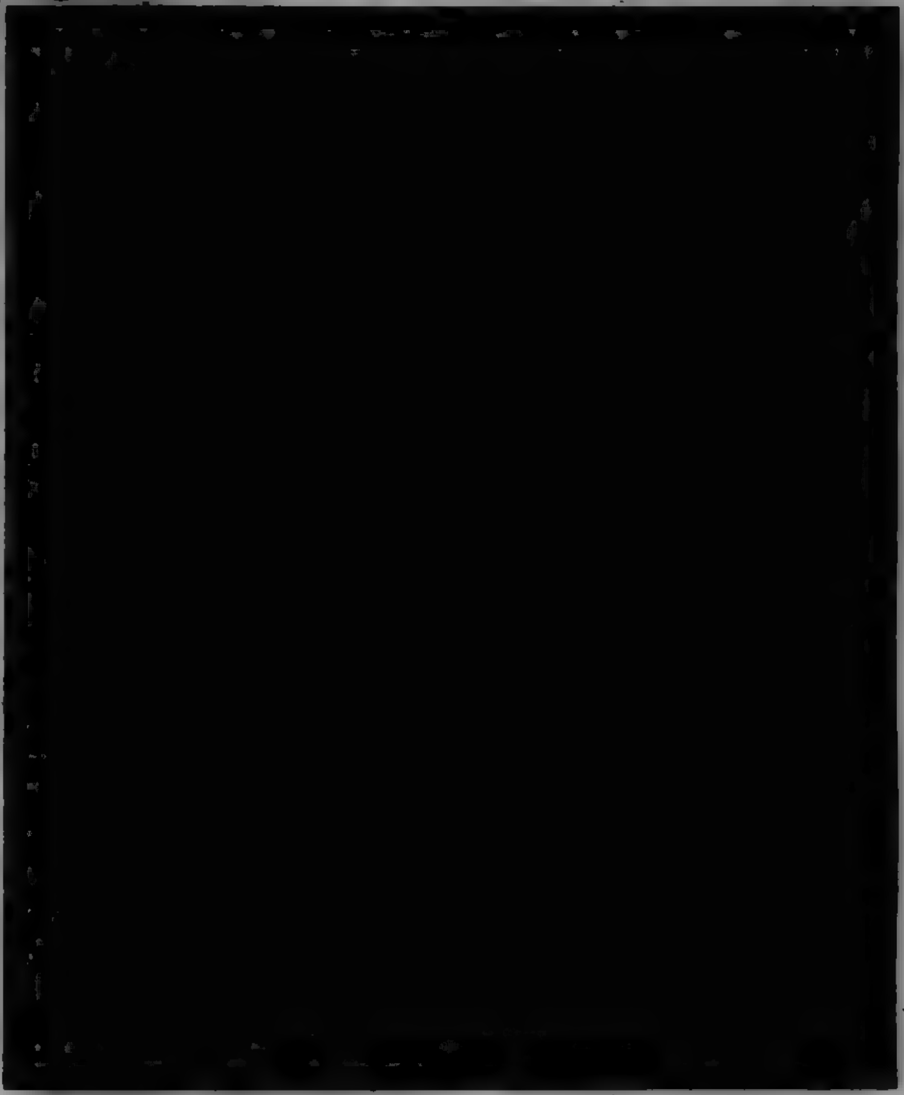
For more information, call us at (703) 435-7222. Or write us at the address below. One day could be crucial in managing information for years to come.



Gary Slack, Exec. V.P. (l), Jason Martin (r), Bob Miles (c), and their associates can help you put information engineering tools to work in your company today.

JMA
JAMES MARTIN
ASSOCIATES
11718 Bowman Green Drive, Reston, Virginia 22090

He's a good kid.
He means no harm.
He just accessed
your computer database.



TOP SECRET security software cuts out any shenanigans with your company's data. By anybody. From phone-phreaking hackers to hard-nosed computer crooks.

In fact, TOP SECRET access control software gives you the most comprehensive, long-term data protection available for MVS environments. Without the trauma.

The Department of Defense has awarded TOP SECRET a C-2 classification, the highest rating the government has given to any MVS data security software product.

TOP SECRET software utilizes the standard MVS security interfaces. So security implementation is easy, painless and practically undetectable to end-users.

With no disruption to normal work routines, TOP SECRET lets you secure critical resources immediately, define others, and then proceed in stages to full data protection. You control security at your own pace with TOP SECRET software's unique phased implementation.

Because TOP SECRET is so flexible, you don't ever have to worry about future compatibility as your systems grow and change. And TOP SECRET makes sure you can protect a full range of MVS software products right now.

Installation Time: less than half an hour, with no IPL and no modifications to the operating system because TOP SECRET uses standard MVS security interfaces. So, when MVS changes, you don't have to.

Administration: convenient, total security administration across all subsystems from any terminal. And with immediate results.

Efficiency: there's no down-time, no work disruptions and no on-going, costly maintenance.

It's no wonder that, in any product comparisons, TOP SECRET security software comes out on top.

As an added bonus, our TOP SECRET Consulting Group is available to make doubly sure that you plan and implement TOP SECRET security successfully. Our experienced consultants will work with you to design a complete data security program for your company's needs.

So, before some fun-loving kid does any long-distance damage to your valuable data, make a phone call of your own. Call 800-237-2067 (in Florida, (813) 263-8011) for your free 30-day TOP SECRET trial today.

TOP SECRET VM will be available October, 1985.

DBMS

from page 64

■ Sir, Inc. has announced that its Sir/DBMS relational data base management system is now available for Sun Microsystems, Inc.'s AT&T Unix-based technical workstations.

The window management facilities of Sun workstations allow users to run several programs concurrently, according to a spokesman. Reports and tables from the data base reportedly can be cut from one window and pasted directly onto another window on the same screen.

Sir/DBMS uses the SQL+ nonprocedural query language, the company's version of IBM's Structured Query Language. It reportedly also offers a procedural language for data retrieval, analysis and application development. Other components of Sir/DBMS include Forms, a screen-oriented data entry and retrieval system; Host, a language interface; Help, an on-line user assistance facility; and Graph, an interactive system for high-resolution business and statistical graphics.

Sir/DBMS for Sun Microsystems workstations costs $10,000 for up to four Sun nodes and $1,250 for each additional node up to 20. Site licensing is available for users with over 20 nodes.

Sir, 5215 Old Orchard Road, Skokie, Ill.

■ Honeywell, Inc. has introduced a relational data base management system for its DPS 8, DPS 88 and DPS 90 computer systems running the Gcos 8 operating system.

Magna 8, developed by Magna Business Systems, incorporates a relational join technique that allows users to access up to 20 data sets simultaneously, a spokesman said. An integrated data dictionary defines and documents new information.

The Magna 8 uses near-English commands for developing and maintaining applications, accessing and modifying the data base and preparing reports.

Magna 8, scheduled for fourth-quarter availability, costs $120,000.

Honeywell, P.O Box 8000/A-79, Phoenix, Ariz. 85066.

■ Micro Data Base Systems, Inc. has announced that its Knowledgeman relational data base management system and report generator is now available on Digital Equipment Corp.'s VAX-11 systems running the Ultrix operating system.

Knowledgeman was previously available under IBM's PC-DOS, Microsoft Corp.'s MS-DOS and Digital Research Inc.'s CP/M 86 operating systems.

Besides the DBMS, Knowledgeman includes text processing and statistics, report generation and forms management functions. Security includes data encryption, user passwords and read/write access codes.

Knowledgeman for the DEC VAX-11 costs $24,000.

Micro Data Base Systems, Suite 400, 85 W. Algonquin Road, Arlington Heights, Ill. 60005.

SQL

from page 57

rection." The other primary determinant in users' selection was the low cost of SQL. Software AG's Adabas, Applied Data Research, Inc.'s Datacom/DB, Information Builders, Inc.'s Focus, Martin Marietta Data Systems' Ramis and IBM's Query-By-Example were listed as the products most often considered before SQL.

Despite the fact that SQL is touted as an end-user-oriented product, Xephon said, only a handful of respondents said they run the product on a separate information center machine. "Although some believe it is wiser to run information center systems on a separate machine and not let them interfere with production," the study stated, "all but three respondents specified that SQL run on a shared machine at their sites."

Respondents said they used SQL most often for ad hoc queries and reporting and simple applications. Not surprisingly, Xephon said, it is not used often for transaction processing. Users said large, complex or high-volume applications presented problems for SQL.

Xephon found applications programmers were the largest group of SQL users, followed by professional staff and "clerical task workers." Those using SQL least were senior management and DP staff other than applications programmers. "Only applications programmers in practice seem to be making significant use of the product," the study said.

"To offer SQL to real end users," it stated, "an installation must provide a framework such as QMF [IBM's Query Management Facility] or [Artificial Intelligence Corp.'s] Intellect to allow the user to concentrate on turning data into information without being bogged down by the internals of running the query and handling the output. The user [also] needs a simple way of saving queries or reports for later use. The user should only specify *what*, not *how*."

Although there was no consensus on what users saw as SQL's most troublesome feature, several users cited the lack of a facility for job accounting and difficulties with table joins as problem areas. Twenty-one users said data base locking was a problem.

Highest rated benefits

The highest rated benefits of SQL were its reliability, value for the price, IBM's support and ease of installation. Most respondents said they were happy with SQL, and only six users said they were considering switching to another product.

"With most respondents," the study stated, "the main benefit is that they can develop systems much faster, the investment is smaller to begin with, and the returns start accruing much sooner. Even if the same application would eventually run more efficiently under a more traditional system, it might never catch up, economically speaking, with the SQL version."

The study, "SQL in Practice," is available for $45 from Xephon, c/o WPWS, P.O. Box 1704, Winter Park, Fla. 32790.

CICS Users:
To increase uptime and control your file availability . . .
Challenge DADS.

CICS Initialization
- Allocates all user and transient data files
- Eliminates CICS downtime if files can't be allocated
- Supports all CICS startup options
- Requires no modifications to CICS

CICS Real Time
- Allocates/deallocates user and transient data files
- Allocates/deallocates files by groups
- Automatically opens and closes files
- Automatically enables/disables transactions and programs
- Provides security exit and audit trail

Advanced Features

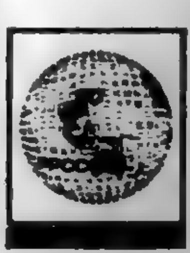
You could win $1000 in the first international computer-generated art contest



CW Communications, Inc. — the world's leading publisher of computer-related newspapers and magazines — is proud to announce its sponsorship of the very first international computer-generated art contest.

All entries must be computer-generated, mounted, and suitable for display. Entries will be judged primarily on their artistic merit, but execution will also be taken into account. Two prizes will be awarded. The winning individual will receive $1,000 (U.S.). The winning organization will receive a trophy.

Winners will be announced during the First Pan Pacific Computer Conference (in Melbourne, Australia, this September 10-13). All entries will be put on display in a special exhibit at this conference.

Enter today. Send your entry to:
The First Pan Pacific
Computer Art Competition
P.O. Box 212 (11 The Avenue)
Hampton, Victoria; Australia 3188.

Entries must be received by August 23rd

FIRST PAN PACIFIC COMPUTER CONFERENCE / CW COMMUNICATIONS

Where can you find a system
for information management
that is a high-speed LAN,
integrates voice and data,
uses twisted pair distribution,
delivers up to 2.56 Megabits
per second to the desk,
and has the reliability
of a phone system?

SOFTLINE

from page 57

have emerged.

The latest languages can be described as applications-programmer-friendly. These languages are not as procedural as the generation 3.5 languages and can be considered professional-friendly. Microcomputer versions of these languages provide almost the same functions as their respective mainframe versions.

Generation 3.9 languages are nonprofessional-friendly and are used to build expert systems. Each statement consists of a condition and an action. If more than one condition is true, then the consequences are executed in either parallel or random order.

For the past few years, people have spoken of these post-third-generation languages as fourth-generation languages. But before a language can be considered fourth generational, it should contain the following nine features:

■ Applications generators. Applications generators currently exist in the form of structured, data base-oriented, inquiry/update transaction processing applications programs. They will probably continue to exist but will give way, in part, to the information generators.

■ Information generators. The information generators will support less structured, user-defined information requirements, dynamic data access paths and reporting formats.

■ Prototype construction. Prototypes are working models of systems that can be changed quickly and easily. A successful prototype gives a view of the system that allows end users to visualize what they will be getting; it also must be only a working model so that it can be easily changed to accommodate end-user requests.

■ Screen mapper. This feature designates the positions of the screen for fields, text and other elements. While all fourth-generation languages may not have this feature, it will be an integral part of most of them.

■ Specifications generator. A specifications generator will represent specifications in a formal way and replace the traditional writing of specifications in English. Specifications are generally imprecise and require a great deal of human interpretation by the applications programmer when creating the code.

■ Nonprocedural DBMS language. A procedural language requires programmers to follow a rigid series of steps to perform an operation. The same result could be achieved by performing the steps in any sequence using a nonprocedural language. A forgiving nonprocedural language permits a great deal of flexibility in performing the steps and is user-friendly. The nonprocedural language can be used in conjunction with a DBMS to perform data entry, storage, maintenance, selection, retrieval and data analysis.

■ Report generator. The generation of reports is always going to be an integral part of any fourth-generation language. The report generator can retrieve data from either conventional files or from data bases under the control of DBMS and can create reports in various forms. The report generator may or may not have updating capabilities.

■ Decision-support languages. A decision-support system consisting of a business model and a data base model must be included in a fourth-generation language.

■ Query language. The major priority of a query language should be fast response.

A true fourth-generation language should also be transparent to the operating system, menu-driven with a prompting system, user friendly, controllable through a data dictionary, supported through at least one DBMS and a usable tool for third-generation language programmers.

With those criteria clearly in mind, will the real fourth-generation languages please stand up?

Atre is president of Rye, N.Y.-based Atre International Consultants, Inc., and a regular contributor to Softline.

LANGUAGES

■ **Foothill Research, Inc. has announced that its Style high-level programming language is now available for AT&T's Unix System V operating systems.**

Style is intended to replace Cobol for business and financial applications development, although Style-based programs can coexist with current Cobol applications, a spokesman said. Style includes a data management system for business, and financial applications development is also available for Digital Equipment Corp.'s VAX series running VMS; Stratus Computer, Inc.'s FT-200, XA-400 and XA-600 superminicomputers; and Data General Corp.'s MV series superminis with the AOS/VS operating system.

Style can access Cobol programs, files and previously collected data. The features reportedly allow users to continue to use their Cobol programs and data while developing new applications with Style.

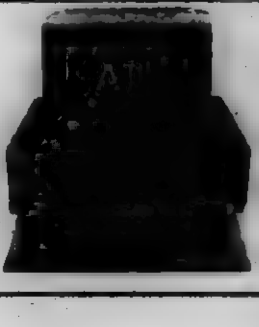
Style costs from $17,500 to $45,000, depending on the system.

Foothill Research, Suite 300, 1301 Shoreway Road, Belmont, Calif. 94002.

■ **Hewlett-Packard Co. has introduced Fortran 77 for the HP 9000 system.**

HP Fortran 77/9000 is based on the Ansi Fortran 77 language standard and is compatible with Fortran 77 on HP 9000 and HP 1000 computers. According to a spokesman, the language includes generalized I/O statements, an include statement

COMPAQ could have stopped here



that allows insertion of program text from another file and statements that eliminate the need for program labels and GOTO commands, the spokesman said.

HP Fortran 77/3000 is compatible with the HP 3000 Multi-Programming Executive operating system.

The product is priced at $5,000, the vendor said.

HP, 3000 Hanover St., Palo Alto, Calif. 94304.

■ Green Hills Software has announced two compilers, the Optimizing Fortran-32000 and Optimizing Fortran-68000, both globally optimizing compilers for Ansi standard Fortran 77.

The products run on Digital Equipment Corp. VAX series superminicomputers as cross-compilers, Sun Microsystems, Inc. Workstations and the National Semiconductor Corp. Sys-32.

According to a spokesman, the compilers implement mainframe compiler optimization techniques and feature full IEEE standard floating-point support.

The SKY floating-point board is supported with in-line code for performance on Motorola, Inc. 68000 systems, according to Green Hills Software.

AT&T Unix calling conventions are also supported.

Native compilers for single-user Sun Microsystems systems are available for $2,000.

Sys-32 Genix compilers cost $3,000, and VAX/Unix cross-compilers are available for $6,000.

Green Hills Software, 55 N. St. John Ave., Pasadena, Calif. 91108.

TEAM

from page 57

team would be to get, say, all your high jumpers together to discuss techniques to make them exceptional high jumpers. They are really individual performers, however, and they have to do their work on their own."

The dual character of the programmer's professional environment, Couger said, can sometimes spawn frustration. Large systems development requires coordination and cooperation, but a team leader walks a fine, easily crossed line between supporting a programmer's individual efforts and stymieing his creativity and productivity.

"Many managers overlook a key factor that interferes with a team's successful operation," Couger said. "That is the very low tolerance for team activities on the part of programmers and analysts. They are willing to participate in group activities and meetings to do something they cannot do alone, to accomplish a goal. But our studies have shown that programmers don't need the social interaction other workers derive from meetings. They would rather be off at their desks doing analysis, design and programming."

Failure to prepare leaders

Couger said he is amazed at how little formal training most team leaders receive before being sent to the development front, so to speak. He said colleges, other than his own, also get poor marks for failing to prepare students to participate in or lead programming teams. The ill-prepared team leader faces a hostile audience.

"If the team leader cannot control the meeting or has not organized it properly, programmers can become very impatient," he said. "They show very little tolerance for poor leadership. That is why so many programming teams fail to meet their objectives."

Couger warned against the assumption that programmers don't appreciate the importance of the team approach to systems building. On the contrary, he said, programmers are eager to discuss group concerns, to learn new techniques and to have their work critiqued by their peers. But their self-motivation, the very characteristic that makes them valuable employees, is chilled in a poorly run team.

"The programmer sees the need for a team and coordination," Couger said. "But he thinks back to teams he was involved with that were inefficiently run, and he comes to the conclusion that, overall, teams are not very effective. His feelings are more about the way teams are run than about their purpose. The programmer has a drive to be in control of his destiny, and when he is involved with a poorly run team he becomes very frustrated."

Team tonic — training

The tonic for the teams, Couger said, is better training of leaders. Also, he said, companies should avoid a management structure that requires a team leader to report to more than one manager.

"The matrix organization, where a leader must negotiate and interact with middle managers, makes it difficult for a team leader, only a newcomer to management, to succeed," he said. When nurtured by just one upper manager, the team leader learns more quickly and coordinates team efforts more efficiently.

Finally, Couger said, teams often fail because management fails to understand what motivates the individual team participants. The work itself is the programmer's primary motivation, Couger's studies indicated. But the work motivation is composed of several other motivators.

Couger uses the following terms to describe them: autonomy, the freedom to do the work required; task significance, the knowledge that the individual job is significant to the entire project; skill variety, being presented with a mix of tasks; task identity, the ability to relate the task at hand to the whole; and feedback on performance. Of those, Couger said, management most often fails to give programmers autonomy.

...but we didn't.

Introducing the new COMPAQ DESKPRO 286™.
More features, more speed, more power.

Most people think the IBM® Personal Computer-AT™ holds the records for speed, memory, and storage. But now COMPAQ® has created a personal computer that pushes the technology much further.

A faster computer

Most computer companies would have been satisfied with a computer that ran programs as fast as the IBM PC-AT. But not COMPAQ. The new COMPAQ DESKPRO 286 runs all the popular programs 30% *faster.*

Work alone or network

Most would have been content with 3 Megabytes of memory, the IBM PC-AT's maximum. But again, not COMPAQ. The COMPAQ DESKPRO 286 can expand to 8.2 Megabytes.

And most would have been comfortable with 40 Megabytes of storage, the IBM PC-AT's maximum. But we designed the COMPAQ DESKPRO 286 to expand up to 70 Megabytes so it can become a faster, more powerful network file server.

Like the IBM PC-AT, COMPAQ offers 360-K byte and high-capacity 1.2-Megabyte diskette drives. But we didn't stop there. We offer you more. Like the *internal* fixed disk drive back-up system pioneered by COMPAQ, to protect all the data on your 20-, 30-, or 70-Megabyte fixed disk drive system. There's room to accommodate up to four storage devices.

No compromises

The COMPAQ DESKPRO 286 offers a monitor that displays both high-resolution text *and* graphics. To get the same feature with the IBM PC-AT, you'd have to pay considerably more.

In short, with the COMPAQ DESKPRO 286, you don't get compromises. Just a more powerful, more advanced, more complete personal computer for anyone who demands the utmost in performance.

And if you need all this power to go, we also offer it in a package half the size of an IBM PC-AT, complete with a handle. It's called the COMPAQ PORTABLE 286™.

Portable or desktop, COMPAQ offers computers without equal. Because we design them without compromise.

For a free brochure or the location of your nearest Authorized COMPAQ Computer Dealer, call toll-free 1-800-231-0900 and ask for operator 7.

COMPAQ
It simply works better.

MICROCOMPUTERS

Tandy reduces 1000 cost, offers hard-disk version

FORT WORTH, Texas — Tandy Corp. has announced a price reduction for its Tandy 1000 personal computer, a machine said to be compatible with the IBM Personal Computer. It also introduced a hard-disk version of the machine and an external 10M-byte hard disk drive.

Under the new pricing scheme, the cost of the Tandy 1000 is reduced from $1,199 to $999 for the standard version, with 128K bytes of memory, one 360K-byte diskette drive, video and graphics interfaces and ports for joysticks and a light pen.

The hard-disk version of the Tandy 1000 reportedly includes those features and a 10M-byte disk. It carries a $1,999 price tag, the same as the Tandy 1200, an IBM-compatible unit, which also has a 10M-byte internal hard disk.

Asked to explain the similarity, Ed Juge, director of market planning for Tandy's Radio Shack Corp. subsidiary, said the two "are totally different machines." The 1200 has an IBM-style keyboard but no graphics card as standard equipment, while the 10M-byte version of the 1000 provides a keyboard like that of the Tandy 2000 personal computer and includes a graphics card.

The Tandy 1000 comes with Deskmate software, an integrated package containing WP functions, a spreadsheet, scheduler, dialer and telecommunications.

The external 10M-byte hard disk drive unit being offered requires a hard-disk controller; a Tandy hard-disk controller is priced at $399. The hard-disk unit itself costs $699.

Tandy is located at 1800 One Tandy Center, Fort Worth, Texas

Symphony aid announced

NEW YORK — The PC Productivity Center of the Center for Advanced Data Processing, Inc. has introduced Symplify, software that adds desktop utility features to Lotus Development Corp.'s Symphony integrated package.

Symplify, priced at $50, is said to aid users by permitting them to access address files, a calendar and an electronic expense report form while working with Symphony. The package is retrieved as a Symphony file and is run with a command sequence familiar to Symphony users. Other features are said to include a simplified data base and report generator, both of which keep Symphony readily available for calculations. Automatic dialing is available for users with a Hayes Microcomputer Products, Inc. internal modem.

The Center for Advanced Data Processing is located in Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

Wizdom XS package out

NEW YORK — Software Intelligence Laboratory, Inc. has introduced Wizdom XS, an expert system for commercial and financial applications, which runs on the IBM Personal Computer under PC-DOS 2.0 or higher.

Wizdom XS, priced at $1,250, is said to be a generic expert system capable of acquiring knowledge bases through being programmed by users. Once the knowledge base is built, users can invoke Wizdom's inference engine to solve problems.

Suggested uses include bank teller assistance, financial investment advisement, sales and marketing support, problem diagnostics and program debugging.

The software, written in C, reportedly has no limit on the number of rules that may be included.

Software Intelligence Laboratory is located at 50 Broad St., New York, N.Y. 10004.

MICRO BITS/BRUCE J. DUNN

Implementing a micro center

Once a microcomputer center has been established as an organizational function, what is needed to implement the center?

Anything fancy, like local-area networks, programming services and specialized applications of the microcomputer (i.e. computer-aided design, voice capabilities or mainframe hookups) will not be covered here. Instead, I'll discuss three topics: the necessities, the near necessities and training. All items included are based on actual experience in operating a microcomputer center.

The necessities

The following items are necessities for a microcomputer center.

- Printers. Most users will need a printer. Any attempts to share them between users will probably not work. The center should have the following printers available: letter-quality, dot matrix, near-letter-quality/dot matrix and even a laser or high-speed printer. They will all be needed at one time or another.
- Printer supplies and accessories. It is amazing how easy it is to forget to order supplies of paper, forms, ribbons, sheet feeders, tractor feeds and cable at the same time the printers are ordered. Most printers do not come standard with any of these items.
- Sound covers. Because most people do not work well in a noisy environment, and because most printers are noisy, sound covers are a necessity. Stand-alone sound covers are available for printers that are not placed on of-

See CENTER page 82

Dunn is an assistant director of data services for the city of Dallas. As the assistant director he manages the systems programming, data base, office systems, information center and microcomputer groups.

Where Giants Fear To Tread

For five years NESTAR has ventured where giants have feared to tread—local area networking. In fact, NESTAR has installed more large local area networks in large institutions than any other manufacturer.

Soon the giants will be involved in networking and that will ensure broad industry support. NESTAR's products will be totally compatible and complementary to the systems sold by the giants. That way you receive the advanced technology and responsiveness of NESTAR today with the comfort that compatibility with giants brings.

Intex unveils X-Y-Z aid for 1-2-3 consolidation

NEEDHAM HEIGHTS, Mass. — Intex Solutions, Inc. has introduced its X-Y-Z software for use in consolidating multiple data sheets produced under Lotus Development Corp.'s 1-2-3 package on the IBM Personal Computer.

X-Y-Z is said to offer the ability to move, merge or summarize any specified rows or columns of data from as many as 255 1-2-3 worksheets. It can let 1-2-3 users create multidimensional worksheets and imposes no additional command structures on the user.

It also is said to permit customized consolidation procedures, such as weighted averages, and to provide users with quick comparisons of data from separate worksheets.

It costs $145 for a 12-worksheet version and $395 for a 255-worksheet version.

Intex Solutions can be reached at P.O. Box 183, Needham Heights, Mass. 02194.

Office Solutions enhances tools

MADISON, Wis. — Office Solutions, Inc. has announced enhancements to its Officewriter and Officespeller software for the IBM Personal Computer.

Officewriter 3.5 is said to offer pagination within the package's editing function, which allows users to invoke a special-function menu from within the edit session with a single keystroke. Also included is automatic footnoting, which allows the user to create and edit up to 999 footnotes per document, the vendor said.

Officespeller reportedly is now able to detect typographical errors and offer the correct spelling from a list of alternatives. Based on the *Merriam-Webster Dictionary*, Officespeller contains 80,000 words and the capacity for users to add customized words. The custom dictionary can be reviewed and modified at any time using the software's custom dictionary maintenance function.

Officewriter features are said to include the ability to adjust text automatically and constantly, permitting users to see exactly what they will print on paper. Officewriter also stores boilerplate language and inserts it into documents, spools up to 10 documents for printing and lines up columns of numbers by their decimals. The product allows data from Lotus Development Corp.'s 1-2-3 to be imported into documents, according to the vendor.

Officewriter costs $325; with Officespeller the price is $445. Officespeller alone costs $165.

For additional information, Office Solutions is located at 2902 Coho St., Madison, Wis. 53713.

Data switching: Equinox makes it simple.

Introducing the Equinox Data PBX; a port selector that makes switching terminals between computers as simple as dialing a phone number.

Installation is simple; do-it-yourself using regular telephone PBX-type cabling and connectors.

And it's simple to integrate into your system, thanks to our super friendly, self-explanatory configuration menus.

The system grows to meet your needs, from 24 to 1320 lines. And the state-of-the-art design combines performance and reliability in a compact package that won't break your budget.

Check out the most full-featured
Data PBX on the market today;
call 1-800-DATA-PBX,
for an on-site demonstration.

Co-Maps software out

PALO ALTO, Calif. — Micro Focus, Inc. has announced software that reportedly allows programmers to create IMS/MFS and CICS/BMS mainframe maps on IBM microcomputers.

Co-Maps is said to include a screen painter and other development tools to generate IMS/MFS and CICS/BMS macros and associated Cobol source statements on the IBM Personal Computer, Personal Computer XT and AT and 3270 Personal Computer.

Used with the vendor's VS Cobol Workbench, a mainframe Cobol applications development program for micros, Co-Maps reportedly allows micros to function as fully integrated mainframe workstations.

Co-Maps also is said to allow existing BMS macro definitions to be loaded on the micro, then modified to produce new maps and map sets. This function allows users to convert CICS applications screens to IMS quickly. The product also allows images created on Micro Focus' Forms micro-based screen painter to be converted into MFS and BMS maps.

The product's development tools are said to include single-keystroke map set, map and field definition and Help, Directory and Copy functions.

Co-Maps requires a minimum of 256K bytes of random-access memory, two 360K-byte disk drives and IBM's PC-DOS 2.0, 2.1 or 3.0.

The product costs $500 and will be available July 1.

Micro Focus is located at 2465 E. Bayshore Road, Palo Alto, Calif. 94303.

Zilog supermicros get Macintosh access

CAMPBELL, Calif. — Zilog, Inc. has announced software that reportedly allows supermicrocomputers in the Zilog System 8000 series to serve as host processors, file servers and communications gateways for the Apple Computer, Inc. Macintosh.

The Ultra-Talk software, developed by Lutzky-Baird Associates of Culver City, Calif., is said to be the first product of the Ultra-Office series, which is based on Apple's Appletalk network.

As a central host, Ultra-Talk reportedly allows multiple Macintosh users to execute programs directly on the AT&T Unix-based System 8000.

According to the vendor, the product gives Macintosh users access to between 52M bytes and 672M bytes of mass disk storage on the System 8000. As a communications gateway, the System 8000 provides access to networks such as IBM 3270 Systems Network Architecture/Synchronous Data Link Control, 3270 Bisynch and 2750/3780, Xerox Corp. Ethernet and X.25.

The Unix-based Zilog System 8000 series is composed of the Model 12, Model 22 and Model 32. The Model 12 is said to support up to 16 users and the Model 22 and Model 32 up to 40 users.

Ultra-Talk costs $2,000 per Unix supermicro and $300 per Macintosh.

Zilog is located at 1315 Dell Ave., Campbell, Calif. 95008.

ORACLE SUMMER SEMINAR SCHEDULE

SOFTWARE

■ Logicraft, Inc. has introduced a graphics software package for use with its Cardware software, a product that reportedly permits all Digital Equipment Corp. minicomputers to run IBM Personal Computer applications.

The graphics package reportedly enables DEC VT240 and Tektronix, Inc. 4010 graphics terminals to display Personal Computer programs running on DEC minis. The package consists of a software-installable driver that converts the bit-mapped image for the Personal Computer into Tektronix command sequences.

The package costs $1,500 for a site license and $200 for individual users.

Logicraft, 3 Graham Drive, Nashua, N.H. 03060.

■ United Software Security, Inc. has announced a corporate license and an annual site license plan for its Privacyplus data encryption software for personal computers.

The license would allow companies to distribute the software to all employees at one site or, under a corporate license, throughout all of their locations. The software, which runs under Microsoft Corp.'s MS-DOS, reportedly requires use of only two commands — LOCK or UNLOCK — to secure software on hard disks or diskettes.

A corporate license costs $2,400 per year, and an annual site license is $800. A site is defined as a customer location with a specific street address, the vendor said.

United Software Security, Suite 100, 6867 Elm St., McLean, Va. 22101.

■ Powerbase Systems, Inc. has announced a version of its Powerbase data base management system software for the Wang Laboratories, Inc. Professional Computer.

The menu-driven Powerbase Version 2.1 for the Professional Computer is said to include a choice of two templates for task-specific applications, including job costing, human resources management, fixed assets, inventory control and sales prospect tracking.

Powerbase 2.1 resides in 320K bytes of random-access memory on the Wang microcomputer.

Powerbase 2.1 costs $595.

Powerbase Systems, 12 W. 37th St., New York, N.Y. 10018.

■ Century Analysis, Inc. has announced Officeware, an integrated and networking software package for the IBM Personal Computer, Personal Computer XT and AT.

The single-user version of Officeware is said to provide window-based, integrated word processing, spreadsheet, business graphics, records management, calendar, electronic filing and other functions. It also reportedly provides terminal emulation for IBM mainframe access.

The network version reportedly can connect Personal Computers to a central Personal Computer AT running Microsoft Corp.'s Xenix or provide interdepartmental networking and mainframe access in a local-area network. The network can be directly connected or gateway attached to non-Officeware host computers, depending on their interface capabilities.

Both versions reside in 512K bytes of memory on each micro.

The single-user version of Officeware, available in July, costs $795. The network version, available in August, costs $995.

Century Analysis, 114 Center Ave., Pacheco, Calif. 94553.

■ Financial Decision Systems, Inc. has announced the Corptax Linx package for its Corptax family of tax preparation software.

Corptax Linx is a corporate, tax-oriented trial balance system that runs on the IBM Personal Computer family equipped with a hard disk and at least 512K bytes of random-access memory.

Corptax Linx will import information from the company's Corptax Mainframe for the posting of tax reclassifications and Schedule M-1 adjustments, a spokesman said. The system features data-entry verification and the ability to produce customer reports using multiple general-ledger account structures.

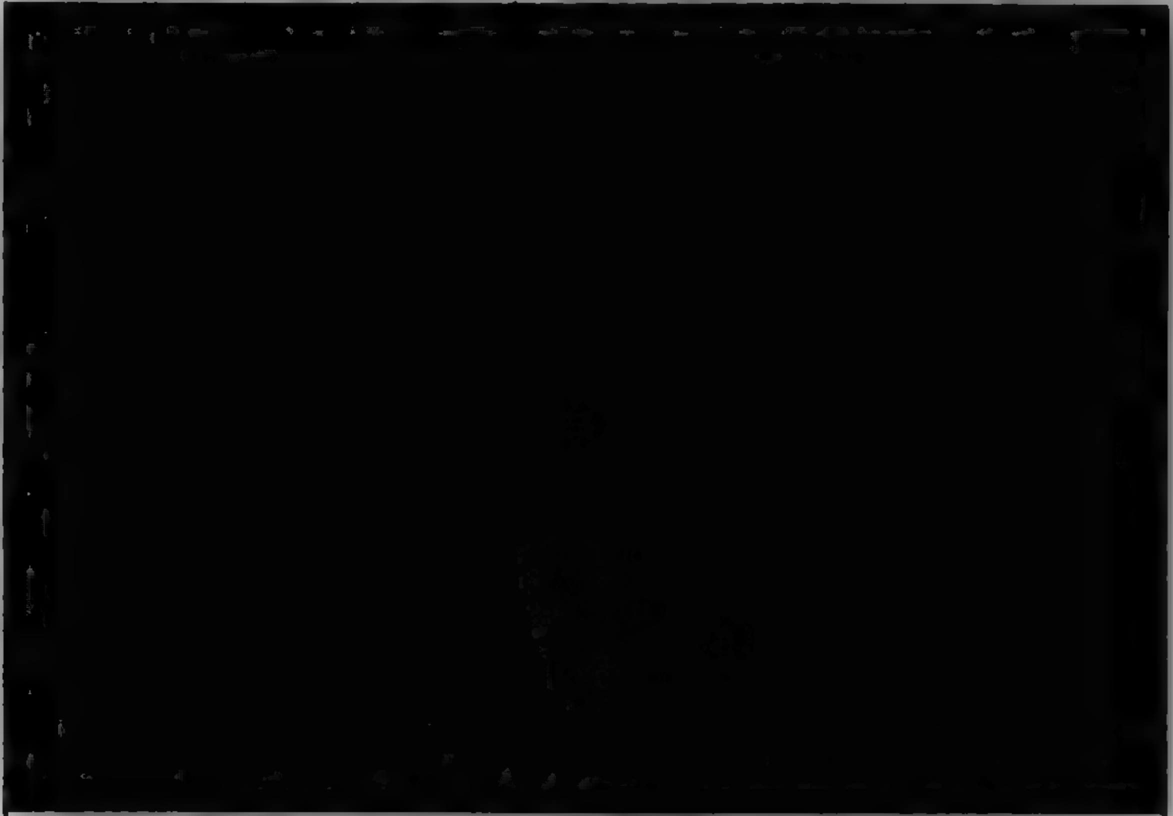
Corptax Linx integrates data with Corptax Mainframe, Micro Corptax and other standard spreadsheets. Corptax Linx, coupled with Micro Corptax, is said to allow for the preparation of all federal and state tax returns — from books to producing tax forms ready for signature.

Corptax Linx costs $850.

Financial Decision Systems, 28035 Dorothy Drive, Agoura, Calif. 91301.

■ BG Software Systems, Inc. has enhanced its PC Tracker inventory management software for the IBM Personal Computer, Personal Computer XT and AT.

Continued on page 78



In an industry of "firsts," Oracle is proud to announce a "last." ORACLE is the last DBMS you'll need. Of course, we're proud of our "firsts," too. Like introducing the first relational DBMS and the first implementation of SQL back in 1979.

Today, eight of the ten largest U.S. companies use ORACLE. In fact, INC MAGAZINE ranks Oracle as the fastest-growing software company in the USA. Surprised? Don't be. ORACLE is the number one relational DBMS, with thousands of installations on IBM mainframes, DEC, DG, HP and most other vendors' minis and micros, including the IBM PC.

Why not IDMS/R, FOCUS or DATACOM/DB?

Compatibility. There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. IDMS/R and the others aren't compatible with SQL. These non-standard DBMSs lock you into one vendor, one technology. Only ORACLE gives you total IBM SQL compatibility.

Portability. Few organizations today use only IBM mainframes. So why buy a DBMS that runs only on IBM mainframes?

Applications written with ORACLE run identically on IBM mainframes, DEC, DG, HP, AT&T, Stratus, Honeywell, Sperry and most other vendors' minis and micros, including the IBM PC.

Why not just go with DB2 or SQL/DS?

Capability. DB2 and SQL/DS are relational DBMSs. Period. ORACLE is a relational DBMS plus an integrated set of 4th generation tools for application generation, report writing, graphics and networking. Together, ORACLE's relational DBMS and tools reduce and often eliminate traditional programming.

Portability. DB2 and SQL/DS run only on IBM mainframes. Period. ORACLE runs on all your computers and operating systems, from MVS and VM, to VMS, UNIX and PC/DOS. But if your organization is committed to IBM's DBMS products, ORACLE on minis and PCs is a unique complement to either DB2 or SQL/DS.

What about Goldengate, dBASE III and pfs:File?

Connectability. The problem with Goldengate and the other PC packages is that they are completely incompatible with the software on your minis and mainframes. This incompatibility makes it difficult to share data, impossible to share programs, and forces users to learn multiple interfaces: One for the PC and another for the mini or mainframe. ORACLE is your standard software solution. All your machines - PC, mini and mainframe - run the same software and have the same user interface. And ORACLE's communications software lets you connect those machines in a network to easily share data and distribute the processing load.

ORACLE

Make your next DBMS inquiry your last. To attend the next free, half-day seminar in your area or receive additional information, write Oracle Corp., Dept. C3, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350 ext. 1969.

IBM Software Notes
News for the DP professional

Rail car leasing is just one of the financial services supported by the GE Credit Corp. network. IBM's Information/Management helps GECC identify network problems fast.

Information/Management Helps GE Credit Keep Network On Track

"We have happier customers," says Tom Dixon, manager of computing and telecommunication services for General Electric Credit Corporation (GECC) in Stamford, Conn. He is describing the use at GECC of IBM's Information/Management, Version 2—a licensed program that helps manage large data networks.

With assets of $17 billion, GECC is one of the country's largest commercial lenders—active in retail credit, commercial leasing and mortgage banking.

And GECC operates a very large network: one with more than 2,000 terminals. The users, Mr. Dixon's customers, are in GECC field offices, retail stores and GECC client offices. They operate workstations, point-of-sale terminals and credit authorization terminals.

IBM's Information/Management program helps Mr. Dixon's staff use its computer to provide better service to customers. It enables the staff to record and retrieve all the data relevant to any network operating problems: the list of equipment at each site, the details of every communication link, a complete record of every problem occurrence at each site, complete data on every type of equipment used in the network, and a detailed file on each vendor.

These data files can be searched to learn, for example, the history of a particular incident or of all previous occurrences of similar problems.

"We know our customer's environment," Mr. Dixon says. "Over the telephone from GECC's customer support center, we can provide procedures to identify or correct the problem. We can see every change made to the telephone circuit serving that site. We can see all problems on that circuit, year to date. And we can talk to the telephone vendor in specific, geographic terms.

"We're automating ourselves so that our present staff can handle a much larger network and a much greater rate of network change," Mr. Dixon continues. "We're already handling about ten times more devices than two years ago. And we're eliminating paperwork and becoming more responsive.

"Our next step will be to automate the management of network change with Information/Management." ▪

Pacific Northwest Bell Creates Online System Fast

"This is a very large and complex system," says John Osterfeld of Pacific Northwest Bell Telephone Company. "Yet we were able to implement it with 12 programmers—half of them brand-new to programming—in a total of 13 months from preliminary design to an online production system.

"It would have taken at least twice as long without ADF."

Mr. Osterfeld, a system analyst for Pacific Northwest Bell, is referring to IBM's Application Development Facility (ADF). Designed for users of the IMS/VS data base/data communication system, ADF greatly reduces the amount of programming required to create an application.

The programmers, under the technical guidance of Mr. Osterfeld, worked with ADF to develop a new version of the Customer Account Retrieval System (CARS) used by Pacific Northwest Bell representatives to call up account histories while answering customer telephone inquiries.

"We were up against a hard deadline. The application had to replace an older version within 13 months," he continues.

"Fortunately, ADF simplified the IMS programming to the point where we could meet the deadline using some people with no programming experience at all.

"CARS now has several thousand users," Mr. Osterfeld points out, "and a very large data base. In our largest center, CARS handles 350,000 transactions a day—12 per second at peak times. So it is an application with a lot of demand on it. Execution has to be very efficient.

"And this version handles 28 I/O calls per transaction, compared to 20 or less in our previous system.

"In other words, the system as written with ADF is actually more efficient in execution than the conventionally programmed system it replaces." ▪

IBM Software Experts Answer the Call to Keep Systems Running Smoothly

To consult a data base of software symptoms and solutions, IBM representatives at customer sites talk by phone to these specialists at the IBM support center in Chicago.

It's 2:00 a.m. You're testing a new application on a tight deadline. Suddenly, something—you don't yet know what—triggers an "abend."

With software, that happens. Each new hardware configuration, new application, or different combination of software releases is a unique environment that may cause a previously hidden problem to surface.

So, to keep IBM intermediate and large system customers up and running, the skills of more than 1,500 software service professionals are always on tap. Part of the IBM National Service Division, these professionals have the full power of special data bases at their fingertips.

You just call a special 800 number. At any time, 24 hours a day, seven days a week, you reach an IBM support center in Chicago, Boulder or Tampa. These locations service IBM's MVS, MVS/XA, DOS/VSE, VM and VS/1 system products and the licensed products associated with them. The centers also service licensed products for the Series/1 and the 8100.

Often the IBM Program Support Representative (PSR) taking the call recognizes the problem and gives the customer a remedy. To help the PSR, IBM maintains a data base of symptoms and solutions for known problems. If the problem requires a revision to the code, the PSR has a Program Temporary Fix (PTF) sent to the customer by the fastest possible method—in some cases, by a telephone link.

Over 50 percent of problems are solved by the PSR. But when a problem is a new one, the customer is put in touch with a program specialist, who often is located near the actual developers of the software product.

On the most severe problems—those which have halted processing—the first goal is to find some remedy, such as a bypass, that allows work to resume. The objective is to complete this within 24 hours.

The second goal for the program specialist is a permanent solution. When this requires a new PTF, the objective is to develop and test it within 14 days. The specialist re-creates the problem, functionally tests the new PTF, and then runs "regression tests" to be sure the fix is reliable.

To close the loop, IBM periodically makes available service updates which combine all recent program changes. ■

Cross System Product Set–Version 2 Recently Announced

With the recent announcement of Version 2, the IBM Cross System Product Set becomes a strategic productivity tool for large systems, as well as for intermediate and distributed systems. This application generator includes three licensed programs: one for creating applications, one for executing them and a third that permits end users to query the VSAM or CMS files.

The Cross System Product Set runs under all operating systems for 30XX and 4300 systems and under DPPX/SP in the 8100. With this version, support is added for IMS/VS/DB and DL/I as data bases for CICS/VS. In addition, it has been enhanced to run in systems with large networks of terminals.

Simplify MVS Installations

The IBM Custom-Built Installation Process Offering (CBIPO) is a simplified packaging of MVS. A CBIPO can cut the time to install an MVS system or subsystem from weeks to days.

Conventionally, a major system change involves a separate tape, documents and installation procedure for each program product.

With CBIPO, you first select the program products you intend to use with MVS. Then, with an automated process, IBM custom-builds an MVS system consisting of the ordered products in the form of distribution data sets.

The CBIPO also includes customized documentation that provides a step-by-step single installation path.

IBM Software for your Business Professionals...

If you're interested in the growing information needs of business professionals, you'll be interested in *IBM Software Notes for the Business Professional and Manager*, an advertisement in recent business publications that featured these products:

- IBM's Query Management Facility (QMF). QMF is part of Dow Corning's end-user computing program. QMF lets employees do ad hoc queries on relational data bases.
- The Information Facility (TIF). Pratt & Whitney manufacturing experts create computer applications quickly, easily and in plain English.
- Info Center/1 is a new functionally integrated decision support product, combining and enhancing three popular IBM products: ADRS, APL/DI, and FPS.
- The IBM Personal Decision Series (PDS) lets PC users perform a variety of tasks on corporate, departmental or personal data bases.

For literature on these products, check "Business Professional Software" in the coupon at the right.

MICROCOMPUTERS

Continued from page 76

Version 2.0 is said to allow ad hoc file searches and reporting for improved development of queries regarding inventories of micros, peripherals, software and accessories. Another enhancement reportedly makes summary report formats available for an improved overview of inventory. PC Tracker Version 2.0 resides in 256K bytes of memory and requires two disk drives.

The product costs $495. Current PC Tracker users may obtain a Version 2.0 upgrade free of charge.

BG Software Systems, P.O. Box 436, Fort Washington, Pa. 19034.

■ Micro Concepts, Inc. has announced hard disk drive management software for the IBM Personal Computer XT and AT.

The Master Menu uses a series of menus to permit users to find and run programs stored on a hard disk. Passwords are said to allow owners or system managers to assign varying levels of security to users.

The software's File Commander function reportedly gives users the ability to execute IBM PC-DOS operating system commands with a single keystroke. Personal productivity tools reportedly include a personal time manager, a scratch pad to store notes and information and a group notice board to post messages among users groups.

The Master Menu requires a hard disk drive system and minimum memory of 192K bytes. It costs $142.50.

Micro Concepts, 4307 Arden Drive, Fort Wayne, Ind. 46804.

■ Schacher, Greentree & Co.'s Greentree Software Division has announced two software products designed to aid decisions made by purchasing managers. Both products run on the IBM Personal Computer and Personal Computer XT.

Purchasing Electronic Notebook (PEN) is a menu-driven data base management and report generating product. The report generator includes a predefined format for item or vendor history reports.

Computer-Aided Purchasing (CAP) is said to be a decision support package designed for the purchasing environment. CAP includes all the features of PEN and uses the same data files but supports decisions through cost comparisons and tracking of discount break points or trigger item thresholds. CAP also features a template to assist the user in preparing customized print purchase orders for existing company purchase order forms.

Both products reside in 256K bytes of memory and require the Microsoft Corp. MS-DOS operating system.

PEN is priced at $295 and CAP at $695.

Schacher Greentree, 122 E. 42nd St., New York, N.Y. 10168.

■ Interchart Software, Inc. has announced enhancement of its Talkshow/PC graphics software for the IBM Personal Computer.

Release 2.0 of the software reportedly offers support for the Tecmar, Inc. Graphics Master graphics display board. It also includes software to support emulation of four graphics terminals, the Tektronix, Inc. 4027, 4010 and 4100 series and the Hewlett-Packard Co. 7221.

In addition, Talkshow/PC is said to include communications, file transfer, off-line recall of mainframe generated charts and the ability to output to a plotter or to produce an electronic slide show. It costs $395.

Interchart Software, 104 Carnegie Center, Princeton, N.J. 08540.

■ Omtool Corp. has announced a version of its Softbol language system that runs under Microsoft Corp.'s Xenix Release 3 on the IBM Personal Computer AT.

The new version is said to allow applications written in Digital Equipment Corp.'s Dibol to be transferred to the Personal Computer AT and other micros. The Xenix-based version also reportedly runs on other micros using Xenix, such as the Intel Corp. 286/310 and the Visual Computer, Inc. 2000.

Xenix-based Softbol is priced at $625 for a single micro system.

Omtool, P.O. Box 477, 1445 Main St., Tewksbury, Mass. 01876.

THE DAWN OF COMPATIBLE COMMUNICATIONS

FutureCom™ Is Here! Introducing the FutureCom 2000 Integrated Area Network™ and the end of compatibility and connectivity problems in networking.

Now you can combine local and wide area networks into a single unified system. FutureCom is the innovation you've been waiting for—the best features of both local and wide area networking in one powerful package.

FutureCom Local and Wide Area Networks FutureCom lets you design custom local and wide area networks. These networks may stand alone, or they may be easily combined to form your own Integrated Area Network. Different networks may be added later on, or the nature of the network may change, without sacrificing connectivity and compatibility.

The FutureCom LS2000 Local Server provides access for computer or terminal devices to an Ethernet LAN for efficient local resource sharing. The RS2000 Remote Server provides wide area connectivity via multiple RS-232 composite links (up to 4 per node).* Both servers support up to 32 channels and provide local and remote switching, port contention and advanced security features.

FutureCom Integration The key to the Integrated Area Network is the NS2000 Network Server, a bridge between Ethernet and RS-232. The NS2000 consists of one Ethernet link and up to four RS-232 links. Use it to connect multiple LANs across standard leased telco lines, and/or integrate FutureCom LANs and WANs into a single network.

Suddenly, the possibilities of networking are endless. Welcome to the new era of compatible communications.

The Future Is Bright A FutureCom network is easy to install, maintain and best of all—to expand. ComDesign understands the implications of a network that cannot be changed and improved upon. FutureCom is designed for continuous growth and diversification, and will grow with you to keep your network in tune with your needs. Modular hardware and software design assures flexibility and adaptability, and additional channel capacity can be added in the field.

Find Out More The Integrated Area Network is the solution to your networking problems. Let us show you how easy it can be to design a FutureCom Network. Call us toll-free (800) 235-6935 in the Continental U.S., or in California (800) 368-8092 and ask for a free FutureCom brochure. ComDesign, Inc. 751 South Kellogg Avenue, Goleta, California 93117. (805) 964-9852. TWX 910-334-1189.

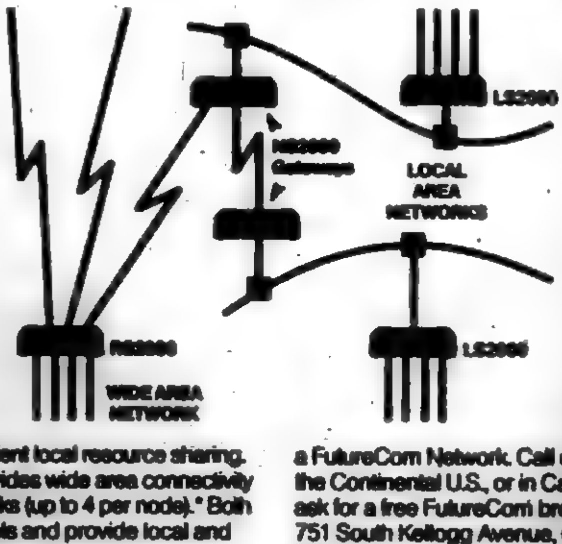
Leaders in Data Communications

*X.25 and other networking capabilities are currently under development.



MICROCOMPUTERS

■ **Raima Corp. has announced an enhanced, multiuser version of its DB Vista data base management software for applications development in the C language.**

Version 2.0 is said to feature multiuser capability and shared file protection, transaction processing and the ability to import and export Ashton-Tate's Dbase II and Dbase III and Ascii files. The enhanced version reportedly includes interactive data base access utilities, one menu driven and the other command driven. The software can handle 16,000 records per file, according to the vendor.

DB Vista 2.0 requires the Microsoft Corp. MS-DOS or Xenix or AT&T's Unix operating system, 128K bytes of random-access memory and a hard disk drive.

Cost of the product is $990 with source code and $495 without source.

Raima, 11717 Rainier Ave. S., Seattle, Wash. 98178.

■ **IBM has introduced a version of its PC/Videotex software for its Personal Computer line.**

PC/Videotex B1.10 reportedly supports the IBM Enhanced Graphics Adapter, allowing 16-color graphics to be produced on the IBM Color Graphics Display in a 320- by 200-pixel, medium-definition graphics format. Under PC/Videotex, users can access videotex services that use the North American Presentation-Level Protocol Syntax.

The software is priced at $250. Subscribers to IBM's extended support program will be able to update to the Version B1.10 for $30. Nonsubscribers with the previous version will be able to update for $55.

IBM Information Systems Group, National Accounts Division, 1133 Westchester Ave., White Plains, N.Y. 10604.

■ **Artelligence, Inc. has announced the Artelligence OPS5+ implementation of its OPS5 language, a high-level language designed to implement forward-chaining artificial intelligence programs. OPS5+ runs on the IBM Personal Computer.**

OPS5+ is intended to allow novice programmers to apply AI methods for expert systems development. The product features a window-based mouse/menu environment. Multiple windows reportedly allow a continuous display of separate information. Source code and interactions are handled in a large window, while other windows display messages, state-of-the-system information and a command menu, the vendor said.

OPS5+ is coded in the C language.

OPS5+ is priced at $3,000.

Artelligence, Knowledge Engineering Department, Suites 212-252, 14902 Preston Road, Dallas, Texas 75240.

■ **Macmillan Software Co. has enhanced the first three modules of Asyst, its software for scientific calculation, using the IBM Personal Computer, and added a fourth module that reportedly simplifies the General-Purpose Instrument Bus (Gpib)/IEEE 488 protocol.**

The enhancements to Asyst are said to include expanded analysis capabilities and support for Gpib hardware. Also included are analysis of variance support and support for axonometric and contour plotting and plotting with error bars. Asyst's expanded color graphics ability reportedly allows easier interpretation of overlaying plots.

The fourth module is said to support more than 10,000 Gpib-compatible instruments and to enable commands to be modified and combined for specific applications.

The modules reportedly can analyze and reduce data, communicate with laboratory equipment and analog signal sources and offer basic mathematics, descriptive statistics and array manipulation.

The price of the modules ranges from $495 to $1,995. The entire package is priced at $1,895.

Macmillan Software, 866 Third Ave., New York, N.Y. 10022.

■ **RSA Security, Inc. has introduced its Mailsafe security software for electronic mail systems. The software runs on the IBM Personal Computer.**

Mailsafe reportedly can authenticate both the source and the content of electronic documents, permitting them to be used as legal contracts in place of signed papers. It gains this capability, the vendor said, through use of a digital signature that is unique for each document.

Other abilities are said to include verifying the source of a received message, assuring the integrity and authenticity of received data and electronically sealing sensitive data.

The software is priced at $350 and will be available in the third quarter.

RSA Security, 1717 Karemont Drive, Sunnyvale, Calif. 94087.

■ **Scitor Corp. has introduced its Project Scheduler Network, a project management software package for the IBM Personal Computer line.**

Project Scheduler Network reportedly offers spreadsheet-style data input templates and interactive graphics. Its project management capabilities include network diagrams, multilevel Gantt charts, work breakdown structure project organization and multiproject analysis.

The software is said to enable resources under its control to be allocated at any time within a job, to enable fractional resources to be assigned and to enable the user to use a mouse to select jobs from a pop-down menu. It is priced at $495.

Scitor, 256 Lincoln Centre Drive, Foster City, Calif. 94404.

■ **Henco Software, Inc. has introduced a version of its PC Info software for the Digital Equipment Corp. Rainbow 100+ and Rainbow 190 personal computers.**

PC Info, the personal computer version of Henco's fourth-generation relational data management system,

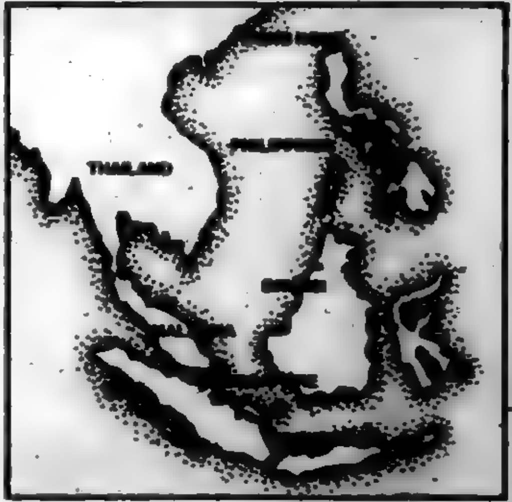
The Asian Computerworld reaches the fastest growing computer market in the world.



Introducing
The Asian Computerworld

The Asian Computerworld is *Computerworld's* sister publication covering the South East Asian marketplace. The English fortnightly tabloid keeps company executives, computer users, potential users and people in the computer industry up-to-date.

South East Asia is considered the fastest growing computer market in the world with a total value of $1.8 billion and annual growth rates for small business systems and micros over 50%. The average annual growth rate is approximately 30%.

The Asian Computerworld, with a total circulation of 10,000, is published in Singapore and printed every alternate Monday. Distribution of the newspaper covers Brunei, Hong Kong, Singapore, the Philippines, Malaysia, Indonesia and Thailand.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *The Asian Computerworld*, just fill out and return the coupon below.

OEM Computer Product Buyers

"The Invitational Computer Conferences bring to you the latest high-tech information you need to hear, and the major OEM products you need to see. We'll be there!"

And you'll find other top OEM manufacturers, such as NCR, Fujitsu, Xebec, Lear Siegler, Siemens and IBM, to name but a few.

Celebrating its 15th year, the "OEM Only" ICCs bring you, the volume buying decision makers, together with the key suppliers of computer and peripheral products. The ICCs also bring you a full day of high-tech seminars, explaining the latest in computer product technologies and what they mean to you, the systems design engineer. As an invited guest, there is no charge to attend the seminars or product displays.

The ICCs, a series of eleven, one-day regional conferences are convenient to where you work. The small, exclusive setting makes it easy for you to meet potential suppliers one-on-one.

Hear what the OEM manufacturers have to say, learn about new technologies, and remember, you may attend "by invitation only."

Continued from page 79

reportedly lets users access existing Info applications, reports and files running on DEC VAX-11 series minis, Prime Computer, Inc. 50 series minis and on IBM Personal Computer XT and Personal Computer AT models in addition to the DEC Rainbow models.

The software reportedly uses a conversational language that enables users to create and maintain information in an accessible format.

PC Info requires 512K bytes of internal memory and Microsoft Corp.'s MS-DOS Version 2.1. It costs $1,200.

Henco Software, 100 Fifth Ave., Waltham, Mass. 02154.

SYSTEMS

■ Tektronix, Inc. has announced the 32-bit Tekstation AT graphics workstation based on the IBM Personal Computer AT.

The workstation can concurrently support Utek, the firm's version of the University of California at Berkeley's 4.2 Unix, and IBM's PC-DOS operating system, a spokesman said. It is also packaged with CAE Systems, Inc.'s CAE 2000 design software.

The system supports applications ranging from CAE-based design capture, to software development. The system offers a maximum of 4.5M bytes of random-access memory, 16M bytes of virtual memory and 280M bytes of local disk space. The system adds a National Semiconductor, Inc. 32016 coprocessor to the IBM AT.

Tekstation AT prices start at $25,000. A file server configuration is available for $40,000 and an Ethernet interface for $1,400.

Tektronix, CAE Systems Division, 1333 Bordeaux Drive, Sunnyvale, Calif. 94089.

■ Micro Five Corp. has announced a microcomputer that is said to be fully compatible with the IBM Personal Computer AT.

The Micro Five Series 5000 is said to offer improved speed over the AT with direct memory access controllers to off-load the CPU, allowing the hard-disk subsystem to read and write a data track on a single revolution. The Series 5000's average disk access time is 30 msec or less.

The Series 5000 is available with Microsoft Corp. MS-DOS 3.1 or Xenix 3.2.

The Series 5000 Model 100 configuration is said to include 512K bytes of memory, a 1.2M-byte floppy disk drive, an RS-232 serial port, a Centronics Data Computer Corp. parallel printer port, nine expansion slots, a clock-calendar with battery backup and an AT-compatible keyboard. It is priced at $3,395. The Model 200 configuration also includes a 27M-byte formatted 5¼-in. hard disk. The Model 200 costs $5,215.

Micro Five, P.O. Box 5011, 3560 Hyland Ave., Costa Mesa, Calif. 92626.

COMMUNICATIONS

■ GSD Systems, Inc. has introduced the Mac/5251, an interface between the Apple Computer, Inc.'s Macintosh and Apple II line of personal computers and IBM's System/34, 36 and 38 minicomputers.

The Mac/5251 reportedly permits the Apple machines to connect via their serial port over twinaxial cable. It provides both cable-through and address selection. When terminal emulator software is used with the interface, the Apple computers reportedly can emulate an IBM terminal.

Mac/5251 is priced at $1,591.

GSD Systems, Suite 505, 600 S. Dearborn, Chicago, Ill. 60605.

■ Anderson Jacobson, Inc. has announced three communications packages that run on an IBM Personal Computer and transmit data at speeds up to 2,400 bit/sec.

AJ Connection II Model 2412-2RA1, consists of an IBM Personal Computer plug-in modem, card guide, Software Synergy, Inc.'s Respond software and a phone cord with modular jack connector. Respond enables a user to store logon and setup procedures for 26 numbers and provides concurrent functions so that users can run a WP or spreadsheet program with the communications package.

The product works with Hayes Microcomputer Products, Inc.'s AT command language and offers full or half-duplex communication at speeds of zero to 2,400 bit/sec.

AJ Connection II Model 2412-2B01 includes the same hardware and Communications Research Group, Inc.'s Blast software, which supports asynchronous file exchanges in block mode. The software reportedly works with 110 types of computers.

A third package, AJ Connection II Model 2412-2C01, includes Microstuf, Inc.'s Crosstalk software.

The packages cost $795 each.

Anderson Jacobson, 521 Charcot Ave., San Jose, Calif. 95131.

■ Data General Corp. has introduced PC Liaison, a software package that enables users to transfer files between DG's Data General/One laptop computer and an IBM Personal Computer or Personal Computer XT.

PC Liaison also permits programs that are not copy protected to be run on the DG/One from the Personal Computer drives, the vendor said.

The software runs on any DG/One and any Personal Computer running under IBM's PC-DOS 2.0 or 2.1 with 192K bytes of internal memory, a floppy disk drive and an asynchronous port.

The package includes a 5-ft cable and is priced at $180.

DG Desktop Division, 4400 Computer Drive, Westboro, Mass. 01580.

MICROCOMPUTERS

■ Digital Communications Associates, Inc. (DCA) has announced that its Irma micro-to-mainframe interface is now available for use with the Data General Corp. Data General/One portable computer.

The new version reportedly enables the DG/One to emulate an IBM 3278/79 terminal, allowing the micro to communicate with a mainframe in an IBM 3270 environment. Irma allows users to transfer data to and from TSO, CMS and CICS mainframe environments, according to the vendor. The Irma board is said to fit into the expansion chassis of the DG/One.

The vendor reportedly modified Irma's terminal emulator program, E78, to be compatible with the DG/One keyboard. E78 revision 1.42 is said to remap the DG/One keyboard to include the numeric keypad found on the IBM Personal Computer.

Cost of the Irma board is $1,195.

DCA, 303 Technology Park, Norcross, Ga. 30092.

■ Racore Corp. has announced a local-area network that can reportedly link up to 16 IBM Personal Computers, Personal Computer XTs or ATs in any combination.

Racore-Net is said to use IBM Personal Computer Network software and the PC-DOS 3.1 operating system. The product reportedly uses token-passing ring architecture and has a 2M bit/sec. data transfer rate. Maximum distance between nodes is 200 ft, and an optional RS-232 data communications gateway is said to allow connection to remote networks.

The network can reportedly be installed in one full-length expansion slot of an IBM Personal Computer, Personal Computer XT or AT. It requires 256K bytes of memory.

Racore-Net is available for $250 per node.

Racore, 10 Victor Sq., Scotts Valley, Calif. 95066.

■ Mead Data Central, Inc. has announced an enhanced version of its software that allows IBM Personal Computers and other microcomputers running Microsoft Corp.'s MS-DOS to access its Nexis news retrieval and Lexis legal research data bases.

Version 1.3 of Lexis/Nexis Communications Software reportedly includes the capability to create, save and recall searches from a user's micro file and is said to support additional models of 1,200 bit/sec. modems.

The Mead software is said to run on the IBM Personal Computer, Personal Computer AT and XT as well as on micros from AT&T, ITT, NBI, Inc., NCR Corp. and Compaq Computer Corp.

Cost of the software is $225.

Mead Data Central, P.O. Box 933, 9393 Springboro Pike, Dayton, Ohio 45401.

■ The Wollongong Group has announced networking hardware and software that reportedly links the IBM Personal Computer, Personal Computer XT or Personal Computer AT to Digital Equipment Corp. VAX series minicomputers running DEC VMS or AT&T Unix operating systems.

Wollongong Integrated Networking/Personal Computer (WIN/PC) reportedly conforms to Department of Defense Transmission Control Protocol/Internet Protocol communications standards. WIN/PC is said to run on either Xerox Corp. Ethernet V1.0 or IEEE 802.3 local-area networks operating at

October 27–30, 1985
Hyatt Regency Hotel
Atlanta, Georgia

Meet the prime movers of retailing at the 1985 NRMA Retail Information Systems Conference!

Join the largest, longest established, and most important conference for high technology applications in general merchandise retailing.

This is no ordinary exhibition; this is a working conference, where retailers come seeking specific and immediate solutions to their retailing problems.

The retailer audience at this conference is the best in the country, almost evenly divided among smaller, medium-sized and large retail companies.

- Owners, officers of the company, and division heads make up 75% of the attendees....the decision makers on retail technology.
- They're in the "mood to buy"!

They are your potential customers!

If you manufacture or provide services for:

- computers
- communications
- point-of-sale, or
- software and/or systems applicable to general merchandise retailers

you can't find a better opportunity to meet these people!

Come join us!

Reserve exhibit space where you can demonstrate your latest product, service, and your complete product line.

Or, conduct a workshop. Present your products or services in a lecture/demonstration to an interested audience, who have read your workshop listing in our program.

Hospitality suites are also available.

For further information, please contact:
J. Joseph Miller
Director of Retail Standards and Technology
National Retail Merchants Association
100 West 31st Street
New York, NY 10001
212-244-8481
Call today! Over 80% of the space is already sold!

CENTER

from page 73

fice furniture. Desktop sound covers are available for the printers that are placed on existing furniture. If sheet feeders are used, care should be taken to make sure the sound covers fit. This is simple logic, perhaps, but it is often overlooked.

■ Other supplies. Diskettes are used quickly, so a good supply should be on hand. Ensure that they are a reliable brand; they are used for valuable departmental data, so don't scrimp. Diskette boxes are a must if the diskettes are to survive storage and occasional transit. Storage boxes help organize disks and can be purchased with locks.

Price agreements for each item mentioned should be implemented prior to the delivery of the first microcomputer. Once you open the doors of the microcomputer center and begin delivering equipment, holding training classes and answering questions, little time will be left for getting supply agreements in place.

The near necessities

These near necessities are dependent upon the condition of the building and staffing expertise.

■ Power conditioners. These range from simple surge protectors to line-conditioning systems and are needed to protect against power surges or outages. Line conditioning systems are the more expensive, but they are also more effective.

■ Maintenance agreements. These ensure that, despite occasional equipment failure, adequate backup and a method for fixing the equipment is available. It is important that equipment be repaired quickly as users can become very reliant upon these machines. A rule of thumb to remember is that warranty work often takes longer than does regular, nonwarranty repairs.

■ An inventory system package. This will help support personnel keep track of all microcomputer center software and hardware.

■ An evaluation methodology. Setting up a methodology of this nature will help the staff evaluate new software or hardware offerings.

■ Consulting services. Consultants are available for evaluating software, writing custom programs, giving intensive guidance to a user or developing a complete system.

■ Additional phones. Microcomputer center phones tend to be in use constantly. This can be because users are asking for help, vendors are asking for sales or staff members are asking vendors for information or help. A second, less publicized phone can be helpful. If dial-up data base services are to be used often, the center even may need a third or fourth phone line.

■ Plotters. Plotters provide an excellent way to present microcomputer usage reports to upper management. Taking surveys of the existing microcomputer users is a good method for keeping track of the organization's need, and a presentation made with a plotter can be effective. If a plotter is to be purchased, so must plotter supplies such as pens, paper, transparencies and cable-switcher boxes.

■ Equipment training. The microcomputer center manager should not assume that everyone knows how to use a microcomputer. Classes should be held regularly, and they should be mandatory for employees with microcomputers on their desks. Classes should instruct users on how to set up the the equipment, load the operating system, protect and handle the diskettes, how to get to the tutorials and what a microcomputer can and cannot do. Classes should also clue users in on how to know when they are doing something wrong and when (and whom) to call for help.

■ Software training. This refers to four- to eight-hour classes that cover one software package. These courses should be provided frequently and should support a core of standard software packages including a spreadsheet, a word processing package and a data base. Using actual company-related data or spreadsheet samples will help. Training also should include refresher courses and roundtable discussions to assist the advanced user.

A last suggestion for the microcomputer center staff is to support a company users group to facilitate the advanced education needs that will develop once the equipment has been around for awhile.

Continued from page 81

10M bit/sec.

The product is said to give the micro full DEC VT100 terminal emulation capability, allowing users to transfer files to and from the VAX and create virtual circuits on local- and wide-area networks. Files reportedly can be copied in either text or binary mode.

The WIN/PC hardware and software package is priced at $1,375, according to the vendor.

The Wollongong Group, P.O. Box 51860, Palo Alto, Calif. 94303.

■ Micro Business Applications, Inc. has announced a network interface that allows its IBM PC-DOS and Microsoft Corp. MS-DOS accounting software to run on all networks that use the Netware operating system by Novell, Inc.

The Network Interface program is said to support file and record locking and automatic print spooling. It also synchronizes data and index file updates to ensure data base integrity. With the interface, Micro Business Applications' accounting packages will support multiuser and networking features.

The Network Interface costs $595.

Micro Business Applications, 12881 Nicollet Ave. S., Burnsville, Minn. 55337.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana Le Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

COMMUNICATIONS

Pin the tail on the market

DATA STREAM
John Dix
CW Senior Editor

A person with AT&T Communications called last week looking for a contact within the vendor of Starlan, a personal computer network made by sister company AT&T Information Systems.

The caller said he had seen a recent article in *Computerworld* describing the ability of AT&T Information Systems' mainstream local network to support Starlan. After making a few calls to AT&T, he hadn't been able to reach anyone that knew much about the personal computer network.

Laughing, the caller said "AT&T is still, after all, a big company."

Yes, big, and with some serious problems yet to overcome. This incident is further evidence of organizational and marketing hurdles facing the corpulent grande dame of telecommunications.

To be fair, AT&T Information Systems is a nonregulated separate subsidiary of AT&T and, as an arm's-length subsidiary, there is supposed to be little interaction between the companies. This separation is stipulated by the Federal Communications Commission's Second Computer Inquiry decision, which deregulated new customer premises equipment. The decision required AT&T to separate Information Systems from AT&T Communications, the only long-distance communications carrier that is still regulated.

AT&T has been vigorously fighting the separate subsidiary ruling on Capitol Hill, saying it hinders the company's ability to compete. The classic reasoning behind the restriction is to keep AT&T from cross-subsidizing its competitive equipment business with revenue made from regulated long-distance services.

See AT&T page 85

Interactive Systems/3M unveils 10M bit/sec. MAP net

ST. PAUL, Minn. — Interactive Systems/3M has introduced a local network that it claims is the first 10M bit/sec. product to conform to Release 2.1 of General Motors Corp.'s Manufacturing Automation Protocol (MAP) factory network standard.

Called LAN/II, the MAP network is said to support multiple-rate synchronous and asynchronous data links and meet both the IEEE 802.3 baseband and 802.4 broadband network standards.

In a broadband factory implementation LAN/II is a 10M bit/sec. network configured in a tree topology and accessed using a token-passing method. The required Headend Control System, a remodulator that is also used for and known as the Network Monitor Unit, costs $27,740.

Terminals and hosts are connected via terminal servers. Several are available: asynchronous servers range from $509/port for a 16-port broadband server to $1,463/port for a four-port box; a single-port High-Level Data Link Control (HDLC) server costs $5,950; a two-port HDLC, $7790; and a three-port HDLC server costs $9590.

The MAP version of LAN/II for the office uses the IEEE 802.3 baseband version of carrier-sense multiple access with collision detection and Ethernet-type cable.

Baseband system components include a $967/port four-port terminal server, a $524/port eight-port box and a $386/port 16-port server. Similar versions of the HDLC servers — with one to three ports — cost, respectively, $4,950, $6,790 and $8,590.

The networks can be interconnected us-

See MAP page 85

Net vendors to do battle at meet

By Mark Bannister
Special to CW

More than 12 major networking companies will square off in New York June 18 to compete in the first Local-Area Network Olympics.

The business people attending the event will not be treated to the spectacle of one Ethernet vendor wrestling with another, nor will crowds roar as an AT&T Starlan vendor breasts the tape inches ahead of a IBM PC Network proponent.

Instead, the hyperbolically named event will actually be a day of written and oral reports on case studies of local-area networking problems. But for the 200 to 400 MIS and DP managers expected to attend, the event may, in its own way, be as gripping as any horse race.

The Local-Area Network Olympics is an attempt by vendors to show direct comparisons between their systems, using the same environmental conditions to show how each firm can solve the complex and expensive problem of linking personal computers in a network. In the convoluted world of networks, such baldly direct comparisons are hard to come by.

Each network competitor will present his hardware solutions to three case-study problems sent to him in advance by the Personal Computer Corporate Forum, the program's host. The solutions should show exactly what hardware — including cabling, network cards and system software — is required to solve each problem and at what cost.

Each program participant will give a ½-hour oral presentation and supply written material documenting specific products, prices and installation procedures. Eight of the network companies will give both oral and written presentations; late enrollees will present their cases in written form

See OLYMPICS page 85

Bannister is a reporter for Infoworld, *a sister publication of* Computerworld.

- Concord Data Systems slashed the prices of its 2,400 bit/sec. full-duplex modem when it added two products to the modem family/84
- Icot announced a hardware fix to facilitate the sharing of data bases on IBM hosts/84
- Western Union reduced its rates by up to 35% for its voice-grade, satellite private-line services/84

How to make your computer room bigger by shrinking your modems.

Trade in your huge, old, ugly and under-featured 9.6 kbps modems on sleek new AJ 9631 modems for only $2995.

We'll also give you a $500 trade-in* for your old working model.

At just over 2" high x 6" wide, you can fit up to 64 in a standard six foot rack and save valuable computer room space.

Use the same modem for standalone or rack mounting.

The AJ 9631 is a full duplex, synchronous modem that operates at 9.6 kbps over a four-wire dedicated circuit in point-to-point communications. It's V.29 compatible.

The AJ 9631's two-call automatic dial backup system can regain your connection over dialup lines should lease lines fail.

(Actual size.)

You also get a full array of front-panel controls [illegible] for easy set-up. With down-line loading and security that redirects control to a central site. Full diagnostics and self-testing assure reliability.

Act now. Offer ends July 26, 1985.

*Trade-ins must be V.29, 4-wire, [illegible] line modems [illegible].

Concord Data lowers price

WALTHAM, Mass. — Concord Data Systems, Inc. has lopped nearly a third off the price of its 2,400 bit/sec. full-duplex modem and introduced two other modems, a version of the product that was reduced in price and a card modem for micros.

Concord Data's 224 Autodial, 2,400 bit/sec. asynchronous/synchronous, full-duplex two-wire modem reportedly has been reduced from $795 to $495. The standard Model 224 without autodial now costs $450.

The 224 Series II models are based on a Rockwell International Corp. chip set, as opposed to the Intel Corp. set used with the older series.

The stand-alone 224 Series II is an asynchronous/synchronous, full-duplex modem that operates at 300, 1,200 and 2,400 bit/sec. It supports Concord Data's command set as well as the command set of Hayes Microcomputer Products, Inc.'s smart modem. The modem can autodial up to 10 numbers and supports the error-correcting Microcom, Inc. Networking Protocol (MNP). It will be available in August for $595.

Concord Data also announced the 224 PC Modem, a single-card modem for internal use in IBM Personal Computers, Personal Computer XTs and ATs. The full-duplex, two-wire PC Modem is also based on the Rockwell chip set. It is an autodial, asynchronous/synchronous device and operates at 300, 1,200 and 2,400 bit/sec. Like the 224 Series II, the PC Modem supports Concord Data's own command set and that of Hayes. Available in June, the $695 modem will not be available with the error-correcting MNP until August.

Concord Data Systems is located at 303 Bear Hill Road, Waltham, Mass. 02154.

Western Union rates reduced

UPPER SADDLE RIVER, N.J. — Western Union Corp. has reduced its rates by up to 35% for its yearly voice-grade, satellite private-line services.

Cities included in the program are Atlanta, Chicago, Dallas, Los Angeles, San Francisco and New York. The company is also granting an additional 15% discount for companies that order 48 satellite voice channels for two years.

Western Union reportedly is offering free installation and echo cancelers on any of 154 city-pair routes for customers placing one-year orders by June 30.

For example, a New York-Los Angeles link would cost $590 per month for a channel under the volume discount program, $695 per month for a year-term order or $965 on a monthly basis, according to Western Union. These prices are subject to approval by the Federal Communications Commission.

Western Union is located at One Lake St., Upper Saddle River, N.J. 07458.

Icot units ease data exchange via hardware

MOUNTAIN VIEW, Calif. — Icot Corp. has announced two communications processors that facilitate the task of sharing data bases on IBM hosts by providing the capability through a hardware fix instead of through software, according to the vendor.

The Crystalink 5220 Inter-Host Processor is reportedly the first communications processor to allow data exchange between two IBM hosts under the 3270 Binary Synchronous Communications (BSC) multipoint control protocol without any software modifications.

The processor has two 3270 BSC multipoint tributary lines and appears to both hosts as an IBM 3271 cluster controller supporting 32 terminals. Interhost message exchange is said to be handled by the device so that each host acts as if it is communicating with its own 3271. Up to 32 transactions can be conducted simultaneously at speeds up to 19.2K bit/sec. with a single physical connection. The communications processor supplies traffic flow and buffer occupancy status to the host, the vendor said.

The other device announced in the company's Crystalink 5000 series is the 5210 BSC Host Processor. This product is said to provide protocol conversion to enable a 2780/3780 batch-oriented IBM host to appear as a 3270 BSC device to an IBM 3270 BSC host. The product features user-modifiable time-outs and poll parameters and line speeds of up to 9.6K bit/sec.

The 5220 is reportedly being used by the Dow Jones News/Retrieval service for its Focus personal banking network. The 5210 is in use at Mellon Bank to link an automated teller machine network of small regional banks to Mellon's Cashstream network, Icot reported.

Prices for the 5220 Inter-Host Processor range from $5,200 to $6,300. The price for the 5210 BSC Host Processor ranges from $4,000 to $6,300.

Icot can be contacted through P.O. Box 7248, 830 Maudin Ave., Mountain View, Calif. 94039.

FINALLY. HELP FOR THE DATA CRAZED.

Introducing Cypress,® Cedar,™ and Juniper.™ Three fast, friendly, infinitely applicable desktop ideas from ROLM.

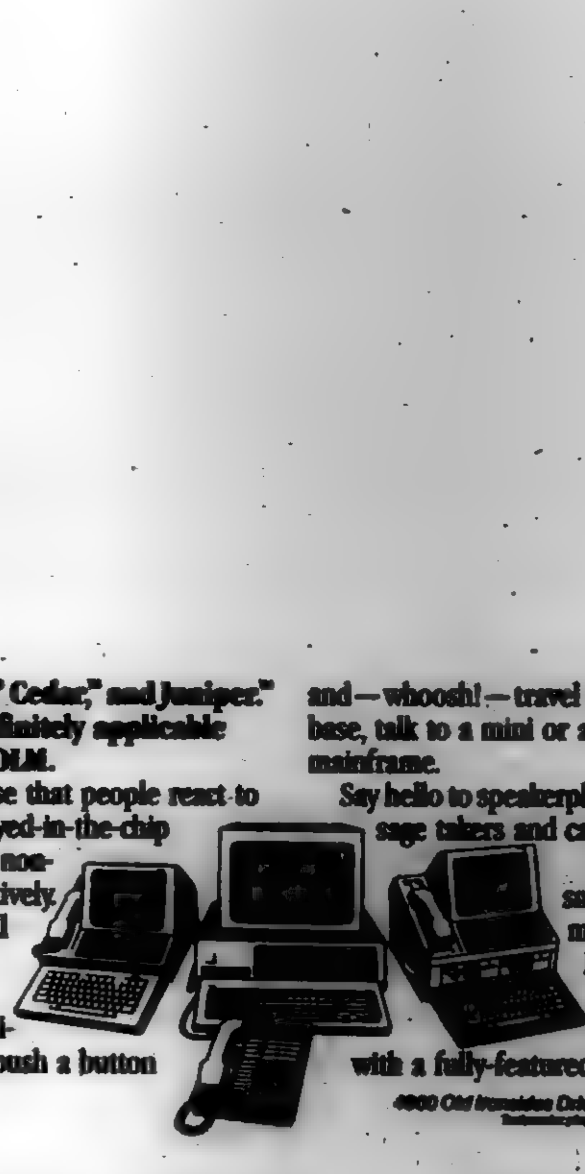
It comes as no surprise that people react to technology differently. Dyed-in-the-chip techies thrive on it. True non-believers avoid it instinctively.

Now you can please all of the people all of the time. Honest.

Say goodbye to complicated log-on codes. Just push a button and — whoosh! — travel all the way to a data base, talk to a mini or access your IBM mainframe.

Say hello to speakerphones, phone books, message takers and calculators. Built right in.

If you want to take snapshots of data in your mainframe, there's Cypress. It's as easy as Point & Shoot. It's a smart little ASCII terminal integrated with a fully-featured digital phone.



4900 Old Ironsides Drive, M/S 626 Santa Clara, CA 95054
[illegible]

OLYMPICS

from page 83

only. At the end of the program, each member of the audience will receive a copy of the written presentations.

The case study problems were designed by Ira Cotton, a consultant with Booz, Allen & Hamilton, who formerly worked for the National Bureau of Standards where he established networking standards for government and White House hardware procurement.

According to Norman Dolph, president of the Personal Computer Corporate Forum, Cotton designed the network problems as three distinct scenarios intended to encompass a range of practical problems. The corporate department problem entails hooking together 12 to 18 personal computers at a multifloor location. The general goal is resource sharing and mainframe interfacing. The solution emphasizes wiring strategies.

The manufacturing/industrial problem involves hooking nine personal computers within a harsh working environment split between two separate buildings. The rapidly expanding small-business problem requires participants to link six personal computers from different manufacturers, keeping economical resource sharing in mind.

'Design time bombs'

According to Dolph, to solve the problems, participants will have to negotiate around "design time bombs that many companies haven't begun to deal with," such as large file sizes that challenge standard hard-disk configurations and long-wire runs that might or might not demand repeaters. Dolph said, "This is Outward Bound for [local-area network] vendors."

Participating companies include AST Research, Inc. of Irvine, Calif.; Corvus Systems, Inc. of San Jose, Calif.; Fox Research of Dayton, Ohio; IBM's Entry Systems Division in Boca Raton, Fla.; Network Development of Malvern, Pa.; Novell, Inc. of Orem, Utah; Quadram Corp. of Norcross, Ga.; 3Com Corp. of Mountain View, Calif.; Televideo Systems, Inc. of Sunnyvale, Calif.; and XComp of San Diego.

"Vendors will have to put their money where their mouth is," said Marilyn Capell, public relations manager for Novell.

Attendance at the Local-Area Network Olympics costs $325. More information is available from Personal Computer Corporate Forum, 279 E. 44th St., New York, N.Y. 10017.

AT&T

from page 83

Equipment competitors favor the separate subsidiary requirement because it keeps AT&T from marketing products below cost and making up the difference with long-distance revenue.

They also like the ruling because it helps limit AT&T Information Systems' access to AT&T customer histories and curtails the flow of customer leads between the companies.

But even if the separate subsidiary requirement were lifted tomorrow, it would take AT&T a long time to circle its wagons to create a cohesive front.

Create forward movement

Rectifying duplication of effort — AT&T Information Systems and AT&T Network Systems market similar products developed from the same technology — would be time-consuming but not as hard as orchestrating the movement of corporate limbs to create forward motion.

A speaker at a recent conference chastised AT&T's marketing efforts and was later told by an AT&T person in the audience that he was right. The sales offices are being deluged by product information, the person said, but no one is sure what it all means or how it all fits together.

The inquiry from AT&T Communications is an indication of that confusion. And separate subsidiary ruling or not, AT&T must start coalescing the pieces and focusing the direction of the company.

MAP

from page 83

ing a broadband/baseband LAN/II gateway that costs $7,250. Wide-area network gateways cost $7,590 for broadband nets and $5,590 for baseband implementations, according to the vendor.

All products reportedly support layers one to four of the MAP network model, which is styled after the International Standards Organization's Open Systems Interconnect network model.

LAN/II, which can be bridged together with Interactive Systems' LAN/I, is slated to be available in August.

More information is available from Interactive Systems/3M, which can be reached through P.O. Box 33600, St. Paul, Minn. 55133.

"You really are weak in math!"

Need a 512 KB, fully IBM-compatible PC that runs programs like pfs:graph,™ the IBM Assistant Series,™ 1-2-3,™ and lets you mini-network through your phone line? Cedar's the one.

Already in love with your IBM® PC or XT but crave the affections of Cypress? Ask for Juniper. Its one slot adaptor card lets your system keep growing. And growing.

Of course, only ROLM has Cypress, Cedar and Juniper. Because only ROLM has the system to run them on. At its heart is the ROLM® CBX II, a breakthrough communications controller that manages voice and data over standard telephone wire.

Simply, brilliantly and cost effectively.

And ROLM has the technical edge, the operational track record and the worldwide service and support organization to please even the toughest customer.

So phone ROLM. High tech. Not high anxiety.

SYSTEMS & PERIPHERALS

User: Quick installation for NAS 8083

By [illegible]
CW Staff

OAKBROOK TERRACE, Ill. — One of the first users of National Advanced Systems, Inc.'s (NAS) 8083 multiprocessor said the system was installed in one weekend and has maintained a 99.9% uptime in the month and a half since then.

May & Speh, Inc. — a service bureau that provides time-sharing, direct marketing and custom programming to customers — bought the $4.2 million machine in order to double its computer resources and add fault tolerance to its operations, said Kathleen Speh, marketing consultant to the company. May & Speh has a customer base of 1,000 clients, and more than half of them — most of the time-sharing clients — are now using the 8083, she said.

The NAS 8083 multiprocessor consists of two NAS 8063 machines tightly coupled in a multiprocessing configuration running as one machine under IBM's MVS/JES2 operating system, said Don Marquardt, the service bureau's data center manager.

The system has 32M bytes of main memory and 32 channels, he added. It is connected to a disk storage system that includes 72 IBM 3350-type drives from Memorex Corp. and 32 IBM 3380-type devices from NAS — a total storage configuration of 45G bytes, he said.

> *'We can run 30 batch jobs at the same time.'*
>
> — Don Marquardt
> May & Speh, Inc.

When searching for a new computer, the company considered IBM's 3081 Model KX processor and an Amdahl Corp. 5780 multiprocessor, Marquardt said. IBM could not deliver the system the company needed until nine or 10 months after it needed it, he said, and Amdahl was having trouble with its machine and delivery dates.

IBM's single-processor 3081 Model KX operates at 15 or 16 million instructions per second (Mips), and the NAS 8083 consists of two 8-Mips machines, so the difference would be in having one job running at 15 Mips or two jobs running at 8 Mips. "It's a toss-up as to which system would have been faster," he said.

Under MVS/JES2, the company runs IBM's CICS, TSO, ISPF and batch environments, Marquardt said. "We can run 30 batch jobs at the same time," he added. A typical daytime load is 80 to 85 TSO users, six CICS regions and 22 batch jobs running simultaneously, he said. The system operates around the clock all week, with no time scheduled for maintenance, he said.

Installation of the system was accomplished on a weekend at the end of April, Marquardt said. "I powered down at 9:00

Memorex fights DOD performance criteria

HARD TALK
Tom Henkel
CW Senior Editor

Does the government have the right to impose quality and reliability sanctions on computer suppliers who bid on multimillion-dollar government contracts?

That is a stone Memorex Corp. overturned last week when it went before the General Accounting Office (GAO) with a complaint about the restrictions that the U.S. Department of Defense's (DOD) Defense Logistics Agency has imposed on a $14 million to $16 million request for proposal for IBM 3380-type disk drives and controllers. The complaint claims that the restrictions, in effect, exclude Memorex from any hope of successfully bidding on the contract.

The outcome of the Memorex complaint will have an impact on the way government agencies procure computer hardware, and it may ultimately influence the way every MIS decision maker evaluates hardware.

Two issues

The Memorex complaint centers on two issues. First, the Defense Logistics Agency has stipulated that 3380-type disk drives must be able to process, on the average, roughly 35 million I/O starts before a failure. That limit is based on monthly reports generated by a hardware reliability package offered by University Computing Co. (UCC) in Dallas.

Memorex's 3680 disk drive has consistently come in last in the UCC rating, well below the 35 million I/Os between failures. The Memorex drives are operating at about 8 million I/O starts between failures. Memorex does not contest the validity of the UCC hardware reliability monitoring service. In fact, a Memorex vice-president praised the service as one of the better methods of monitoring hardware performance.

The crux of Memorex's complaint is that the company feels the UCC service fails to take into consideration some extenuating circumstances. For example, the bulk of Memorex's 3680s have been installed fairly recently, compared to competing vendors' products. Therefore, Memorex contends it has a higher failure

SHOP TALK/WAYNE HEIMSOTH

Developing friendly systems key in manufacturing

Configuring the hardware for a manufacturing system is only one part of the process. Another, sometimes difficult, aspect of developing a manufacturing system is creating a system that gives operators the necessary words and images to allow them to do their jobs, such as building parts, effectively.

Of course, the better the words and images are presented, the faster and more accurately operators will be able to perform their jobs. This is often referred to as user-friendliness, which consists of the following:

- Eliminating the need for operators to search for a document referenced by another document.
- Not requiring an operator to make judgments about which section in a document the manufacturing process really should follow.
- Eliminating the need for an operator to interpret a blueprint or to determine the step-by-step tasks to be followed, and so on.

Lockheed Missiles and Space Co. is currently developing such a system. In addition to the features mentioned above, defense contractors also need to record specifically how the part was built. This is often difficult, because the development effort can sometimes change on a daily basis.

So, as a defense contractor, Lockheed must be able to get timely, revised instructions out to the shop floor to improve or correct a problem found in an earlier design. The company must also know how parts produced earlier were built in order to analyze a situation or problem found when that final product — a missile, for example — is tested.

After evaluating 14 different vendors, Lockheed decided upon a Hewlett-Packard Co. system consisting of an HP 3000 superminicomputer using HP's HPword word processing software, TDP electronic publishing software and a digitizing camera. The HP system turned out to be the least expensive system of those evaluated.

The system Lockheed currently is developing takes text and data from a computer-aided manufacturing system and combines it with images and data from other systems into one work instruction package. In other words, the operator would not have to find and use numerous documents to follow the steps needed but would have one document with all required information merged together.

A generative planning system can be used to begin the process of work instruction creation and will be the controlling source for operational sequence statements and reference call outs. If any change is made, causing a revision to the instructions, the manufacturing engineer will return to this source system and make the change, guaranteeing that a new revision level is generated and that all systems needing this data receive the same data.

The output from this system will feed the HP 3000 and any other system that will need the

SYSTEMS & PERIPHERALS

DATA STORAGE

■ MDB Systems, Inc. has released two enhanced storage module disk drive controllers for Digital Equipment Corp.'s PDP-11 Unibus and VAX series systems, with data transfer rates of up to 1.8M byte/sec.

The MDB-DK11-RM and MDB-DK11-RP hex-size controllers are said to operate disk drives with a storage module drive interface that can operate at the standard data rate of 1.2M byte/sec. as well as at the 1.8M-byte rate of the Fujitsu Ltd. Eagle disk drive.

When used with Control Data Corp. 9762 or 9766 disk drives, the disk controller generates packages that are media compatible with DEC's RM02 and RM05 systems, according to the vendor.

Each version costs $3,900 in single quantities, and OEM discounts are offered, according to the vendor.

MDB Systems, Box 5508, 1995 N. Batavia St., Orange, Calif. 92667.

■ EMC Corp. has announced add-on memory boards for Hewlett-Packard Co.'s HP 3000 computer systems.

The EMC HP-401 provides 1M byte of main memory for the HP 3000, models 39 through 48, according to the vendor.

The product is reportedly installed in the HP 3000 system without modification to the CPU or operating system.

The EMC HP-401 costs $5,400.

EMC, 12 Mercer Road, Natick, Mass. 01760.

TERMINALS

■ Logicraft, Inc. has announced components of an integrated color graphics workstation that works with the company's Cardware system, a combination of hardware and software that gives IBM PC-DOS or CP/M 86 functionality to Digital Equipment Corp. computers. The DEC computers include the LSI-11 and VAX series machines like the Microvax I and II.

The color graphics workstation provides Cardware users with the color graphics capability of the IBM Personal Computer, the vendor said. The system is said to include a color display with 320- by 200-pixel (color) or 640- by 200-pixel (black-and-white) resolution. When not being used for Cardware, the workstation reportedly emulates a DEC VT100 series terminal.

The workstation has two components: a daughterboard that is installed into a slot on the DEC equipment and a workstation pedestal, to which the user must add an IBM Personal Computer-compatible keyboard and monitor. The two components are connected using standard television-grade coaxial cable.

The daughterboard and workstation pedestal cost $900.

Logicraft, 5 Graham Drive, Nashua, N.H. 03060.

NAS

from page 97

p.m. Friday, and at 10:00 p.m. Saturday, it was up and running. We completely replaced the 8063 CPU that we had and added a bank of 3380-type drives and a [Hewlett-Packard Co.] laser printer in 25 hours," he said.

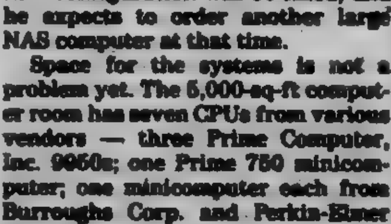
The company's TSO Trivial Command response time, normally 0.2 sec., has remained about the same, and the normal 0.5 sec. response time for CICS did not change, Marquardt said, but batch jobs run about 25% faster than before. May & Speh ran no benchmark tests because they bought the machine before it was actually on the market, he said. "We knew our business needed it, and we've been very satisfied with other NAS equipment that we owned," he said.

The 8083 multiprocessor configuration will run at 190% of the functionality of two single processors, Marquardt said, and on the first production day, he attained a 180% function rate. The system generally runs at 140% because the company has not placed enough work on it yet, he said. In two to three months, the new configuration will be filled, and he expects to order another large NAS computer at that time.

Space for the systems is not a problem yet. The 5,000-sq-ft computer room has seven CPUs from various vendors — three Prime Computer, Inc. 9950s; one Prime 750 minicomputer; one minicomputer each from Burroughs Corp. and Perkin-Elmer Corp. that belong to customers; and the NAS 8083.

"We call the 8083 the world's longest computer," Marquardt said. The 6-ft high, 3-ft wide machine stretches out 30 ft long, he said, just for the processors and main memory. A staff of 20 operators and tape librarians and four systems software people support the conglomeration of equipment, and 100 applications programmers write software for customers, he said.

For the $4.2 million it spent, May & Speh received the CPUs, two operator consoles, a console printer and three power distribution units that convert 220 volts into 440 volts so the system can take power directly from the power company, Marquardt said. The system is air cooled by a standard computer room air conditioner, he said.



"Darn it! I enjoyed shuffling papers!

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:

- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC, PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

IBM, IBM PC, PC XT, 3270 PC, XT/370, PC AT, and AT/370 are registered trademarks of International Business Machines Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

PRINTERS/PLOTTERS

■ North Atlantic Industries, Inc. has announced that two members of its 7000 family of printers have been modified to meet the U.S. government's North Atlantic Treaty Organization's Communications Security Information 5100A (Tempest) specifications.

The models 7020 and 7035 have been renamed 7020T and 7035T, respectively. The printers feature emulation of Diablo Systems, Inc. 630 daisywheel printers for word processing applications, an electrically alterable read-only memory for storing printer parameters and an extra 8K bytes of random-access memory for a total of 16K bytes to allow multiple fonts to be downloaded, the vendor said. The printers reportedly have both parallel and serial interfaces.

The 7020T costs $3,590 per unit, and the 7035T costs $3,990 per unit.

North Atlantic Industries, 60 Plant Ave., Hauppauge, N.Y. 11788.

LOCKHEED

from page 87

same data and serve as the source of intelligence to assemble all the other parts needed to create a work instruction.

Documents that are referred are to be created on the HP 3000 using HPword and TDP for text and HPdraw and the digitizing camera system for images. Printed output, including images, can be sent either to a 12 page/min or 45 page/min printer.

The application programs that Lockheed will develop will take the intelligence out of the source data and combine the reference text and images from the other documents into one output document — the work instruction.

The result of this will guarantee that operators have all the necessary documentation at their fingertips to build a given part. Lockheed is also trying to ensure that incorrectly referenced documents can not be used, since the computer will merge the correct version of the text and image into the work instruction under automatic control.

Lockheed also hopes to build features into the system that provide for controlled changes and work status monitoring.

Any changes that can be made overnight will be done through the normal processing steps. There will be a procedure, controlled by computer, through which an authorized person can prepare and issue a change physically from the shop floor. Those changes that must appear in all subsequent revisions of the work instructions for that part number, will be tracked so their incorporation into the control system is ensured.

This same system will be used to give status to the preparation of work instructions. When a revised work instruction needs to be prepared, it will be logged as outstanding work and given a revision code. When the preparation has been completed, that part number and edition number will be locked out for changes (computer-controlled) and held in an approval status until all approvals are obtained. Finally, the work instruction will be computer-released for use when all approvals are obtained.

PROCURE

from page 87

rate because most of its users are either testing and debugging their new Memorex drives (Memorex claims users deliberately allow multiple hardware failures in efforts to identify a system problem) or have not ramp-tested 3680s into full production.

The DOD said it would consider Memorex's arguments if the reliability ratings on the 3680s were getting better over time. But a spokesman said the 3680s seem to remain consistently in the basement of the UCC reports.

The second complaint Memorex has with the DOD is the department's stipulation that at least 25% of the disk control units purchased in its contract have either 16M or 32M bytes of cache storage. Memorex currently does not offer a disk controller with cache memory. Consequently, a Memorex bid for the DOD contract will be assessed a monetary penalty for not being able to meet the cache memory requirements. The financial penalty will make almost any bid by Memorex less attractive than bids from the competition.

The upshot of the Memorex complaint is whether a government agency can impose highly restrictive demands on bidders for specific contracts.

In a time when government agencies are facing public pressure over unwise purchases, such as hammers and ashtrays that cost several hundred dollars each, the DOD Defense Logistics Agency seems to have set a series of guidelines that it hopes will ensure the purchase of reliable products that adequately meet its needs.

The question Memorex appears to be raising is whether the statistical information used to develop the criteria for the DOD contract evaluates all vendors fairly.

Herein rests an issue that faces virtually all buyers of hardware: Statistics can be manipulated, misunderstood and misused. Marketing and sales people seem to have an inborn knack of doing all three, choosing only those statistics that put their products in the best light. All other statistics always seem to be either invalid or not to apply to one's particular situation.

Consequently, it is getting progressively harder to get straight answers out of vendors — that is all vendors, not just Memorex. The result has been a growing distrust of the information presented by vendors.

Perhaps the hardest tasks facing DP executives charged with making large hardware purchases today is sifting through tons of vendor hype, trying to find usable information with which to compare competing products. If users cannot fully believe the information provided by the vendors, what's left?

Benchmark often a luxury

It is clear that products and services that claim to analyze products objectively will increase in popularity — and with good cause. It has already become impossible for users to run benchmark tests on every piece of hardware dragged into the data center. For many DP executives, an adequate benchmark on a mainframe, let alone on peripherals, is often a luxury.

If the GAO rules in favor of the DOD, Memorex will have forced the government to put a stamp of approval on third-party hardware evaluation services, and the services will flourish. If the ruling falls in Memorex's favor, the GAO may have hamstrung every government agency trying to cope in the increasingly hype-oriented computer marketplace.

Whatever the decision, there will be ramifications for commercial users. Third-party product evaluation services that are widely used by the government can quickly become standards in the private sector as well. Likewise, if the government bans use of such services, it shakes their credibility for everyone.

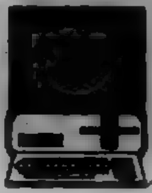
COMPUTER INDUSTRY

Wall Street style helps Gartner grow

SECOND OF A FIVE-PART SERIES

By John Desmond
CW Staff

STAMFORD, Conn. — The phone in the marketing department of the information industry consulting firm rings repeatedly without being answered. The man making the call, the firm's president, scowls. He is not pleased. He tells his secretary to scold the marketing people for not answering the phone.



A high-paying client might have been making the call, not just Gideon Gartner. High-paying clients of the Gartner Group, Inc. expect instant responses to inquiries. The company prides itself on having senior analysts answer client inquiries directly on the telephone. That is one of a number of services offered by the six-year-old firm, which has shown impressive growth figures.

While the Gartner Group is not publicly held, its president freely offers the following revenue figures:

- $600,000 in 1980.
- $1.6 million in 1981.
- $3.2 million in 1982.
- $5.2 million in 1983.
- $8.8 million in 1984.
- $14 million in fiscal 1985, ended in March.

Grigsby Markham, the Gartner Group's senior vice-president of finance, said the firm was profitable in fiscal 1985 and broke even in fiscal 1984.

The company's growth has averaged 60% to 65% each year. The firm now has more than 140 employees and claims a 95% client renewal rate. "There is tremendous momentum," Gartner said. He projects revenue of more than $22 million in fiscal 1986. The figures are consistent with a survey published in *Inc.* magazine in December, although a former Gartner Group employee suggested the latest figures may be slightly inflated.

The company claims it has some 1,000 individual clients. The breakdown by company is approximately 250 user firms, 125 vendors and 250 institutional investors, a spokesman said.

Funded by venture capital, the firm is bound to see changes in the future. "It's obvious that a company like ours, which is funded by venture capitalists, at some point either has to go public or has to sell itself. At some point, the shares get liquefied," Gartner said, but he did not indicate when that would happen.

At the Gartner Group's headquarters here, phrases like "net it out," "value added" and "bottom line" are frequently spoken. What distinguishes the Gartner Group from its competitors is its Wall Street style and staff experience, according to Gartner. Gartner worked for seven years gathering information for IBM before moving to Oppenheimer & Co., a Wall Street brokerage house where he worked in research until 1979. Gartner called this Wall Street style the firm's heritage. "The whole style of our company is a business style, whereas the styles of our competitors tend to be very data oriented, without

U.S. firm calls for quotas on Japanese chips

By Clinton Wilder
CW Staff

SUNNYVALE, Calif. — A leading U.S. semiconductor manufacturer has called for quotas to limit Japanese imports in the wake of recent charges that Hitachi Ltd. is selling chips below cost to gain U.S. market share.

A spokesman for Advanced Micro Devices, Inc. (AMD), the No. 2 American maker of 256K-byte erasable programmable read-only memory (Eprom) chips, said the recent allegations against Hitachi represented the proverbial last straw in the battle for market share. Hitachi is currently the leading supplier of 64K-byte Eprom chips in the U.S., while two other Japanese chip makers, Mitsubishi Ltd. and Fujitsu Ltd., are second and third, respectively.

"It's time to fight back," said AMD Vice-President of Communications Elliott Sopkin. "We've been slapped one time too many and [Jerry Sanders, AMD president and chief executive officer,] is outraged. We think we have to have a quota system. [Japanese vendors] have 17% of our 256K Eprom market, and the U.S. has 10% of the Japanese [market], so we should limit their dollar imports to even them up. It's that simple."

The latest skirmish in what appears to be an inevitable U.S.-Japan high-tech trade war was touched off earlier this month when a U.S. trade official indirectly charged Hitachi with dumping, or selling below cost, 256K-byte Eprom chips in the U.S. Published reports indicated that Hitachi's Integrated Circuit division in San Jose, Calif., circulated a memo advising its distributors to offer chip prices 10% below those of AMD and Intel Corp., the leader in the 256K-byte Eprom market, with profit margins guaranteed by Hitachi. Efforts to obtain a response from Hitachi were unsuccessful. Retiring U.S. Undersecretary of Commerce for International Trade Lionel Olmer made the charges at a Tokyo farewell dinner in his honor.

Sopkin said AMD's sales force has found the 256K-byte Eprom prices offered by Japanese vendors have fallen much faster than the industry standard over the past several months. "It's obvious that the

Margin for error shrinking

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

If there is a bright light to the current computer industry slowdown, it is hidden far, far over the horizon.

When an industry is growing at an average rate of 20% to 30% annually, companies caught up in the hectic pace can get by with some minor problems. A seemingly insatiable demand for products serves to insulate management from the penalties of miscalculations.

But when the party is over — and it certainly looks like the last guests are heading for the door — those minor problems become monumental obstacles to a corporation's continued good health.

A case in point — Wang Laboratories, Inc.

One year ago, the company seemingly could do no wrong. Revenue had climbed above $2 billion and the office automation giant seemed headed for $3 billion and beyond; some even figured that eventually Wang could quite possibly displace Digital Equipment Corp. as the No. 2 manufacturer.

Those aspirations have come crashing down. And it is the small problems that are now hampering the company most.

When its compound annual growth rate was 30% or better, Wang could afford not to worry about complaints concerning service; the MIS manager could be suffered, if not ignored, because Wang owned the department that made the decisions; and if development schedules slipped, too bad, because customers were chomping at the bit

See WANG page 96

Inventor suing Wang, IBM for patent infringement

MIAMI — A 30-year-old Fort Lauderdale, Fla., inventor has added Wang Laboratories, Inc. to his list of patent infringement lawsuit targets and is expected to sue more computer industry giants in the coming weeks.

Robin Elkins last week filed a federal lawsuit against Wang in U.S. District Court here, claiming that the store-and-forward system in Wang's Digital Voice Exchange illegally uses analog-to-digital conversion technology that Elkins patented in 1978. Last month, Elkins sued IBM and its subsidiaries, Rolm Corp. and Rolm Corp. of Florida, on the same charge, citing IBM's Audio Distribution Systems and Rolm's Phone Mail products.

IBM was expected to file a formal response by today. IBM spokesman Lyle McGuire declined to comment on the suit until a formal response was drafted.

Elkins and his attorneys have filed patent infringement notices against some 50 companies in the past several years, but the actions against IBM and Wang are his first lawsuits. Don Feldman, an attorney for Elkins, said legal action is now being considered against several more companies.

Feldman said several companies rejected Elkins' technology as useless when the inventor tried to sell it to them in the 1970s, then later used the technology in their products. "As long as the industry continues to stonewall us and reap the rewards of Elkins' invention, we will continue to seek redress in the courts," Feldman said. "It would have been a much happier situation if the companies had negotiated with us in good faith, but it appears they have never taken us seriously."

The named plaintiff against IBM

See SUIT page 93

Marketers beware: Bundling can violate antitrust laws

OUTSIDE LINES
A. D. Saunders

After litigation lasting some four years, a U.S. District Court of Appeals determined that Data General Corp.'s bundling of the Nova Rdos operating system with its Nova CPU and other peripherals violated the antitrust laws (Digidyne Corp. v. Data General, U.S. Court of Appeals for the Ninth Circuit; Docket Numbers 81-4626, 81-4667, 81-4671 and 82-4162).

To many DG customers, Rdos was among the best — if not the best — operating system on the market. Customers testified that it was "comprehensive, compatible, field proven and rapid, running four times faster than any comparably priced system. It was, in fact, the only full-service operating system available for the Nova CPU."

Nova Rdos and CPUs were sold mainly to OEMs, who put them together with their own application software products for resale. DG licensed Rdos to customers, but only to those customers who also purchased the CPU. DG also required licensees of Rdos to buy not only the CPU, but other hardware, usually peripherals, or pay a license charge. DG protected production of Rdos by trade secret agreements.

Tying arrangement

The requirement that a purchaser can obtain one product only by purchasing another is known in legal terms as a tying arrangement. In this case, the CPU would be known as the tied product, and Rdos would be the tying product.

According to DG, "the tie was devised to ensure recovery of the development costs" associated with Rdos. Futhermore, DG said that "it would be unfair to permit emulator CPU manufacturers to reap the benefits of [DG's] software research and development when they sell their competing CPUs for use with [DG's] software."

DG's decision to tie was made after a competitive manufacturer of Nova emulator CPUs requested permission to use Rdos.

Digidyne produced emulator CPUs that were "designed to perform the Nova instruction set and thus to make use of Rdos." Digidyne, the plaintiff in this case, claimed that the bundle that was required to be purchased from DG unlawfully restrained trade and thereby violated the Sherman and Clayton Acts. Digidyne was correct in its analysis.

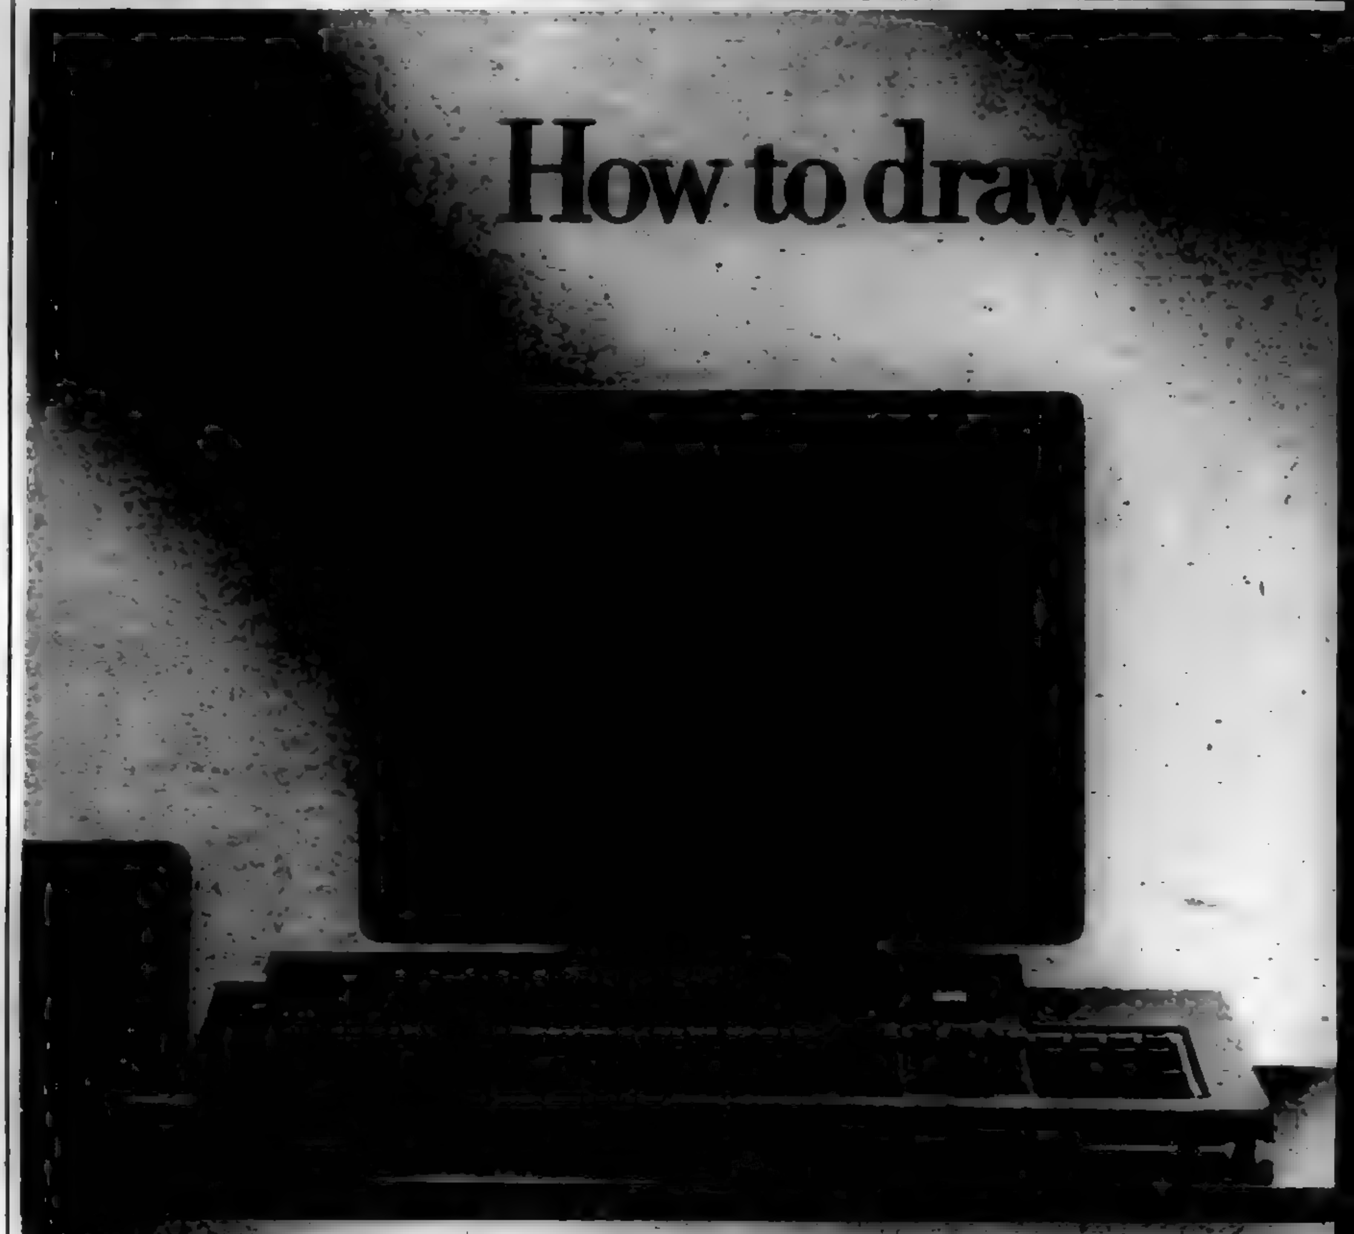
A tying arrangement is illegal in and of itself if three conditions are satisfied. First, the purchase of the tying product must be conditioned on the purchase of the tied product; second, there must be sufficient economic power regarding the tying product to restrain competition in the tied product; and third, there must be an effect upon a substantial amount of commerce with respect to the tied product.

With those conditions satisfied, a detailed market analysis of the relevant market is not required; all that is required is market dominance.

Market dominance is the "power to control price and to exclude competition . . . The crucial economic power may be inferred [however] from the tying products' desirability to any appreciable number of consumers or from the uniqueness in its attributes" (U.S. v. Loews; Fortner I).

In other words, as long as "there are some buyers who find a seller's product uniquely attractive and are therefore willing to pay a premium above the price of its nearest substitute, the seller has the opportunity to impose a tie" (Fortner II). When such forcing occurs, competition on the merits in

Saunders is a Boston-based attorney whose practice includes marketing issues.



How to draw

IBM 3270 PC/G

If your department gets repeated [illegible] for presentation graphics, IBM has [illegible] answer.

[illegible] on a Smart Desk equipped with a [illegible] Computer/G or GX.

[illegible] PC/G or GX gives you easy [illegible]-based graphics and data. [illegible] IBM's new Graphics Editor and [illegible] software, you can work [illegible] to draw your own high-[illegible] charts, diagrams and free-[illegible].

You can actually create or edit directly on the screen, using either a mouse or a tablet. What's more, you can select from a wide range of colors, lines and type styles to arrive at a presentation that works the best for you.

If you want to create foils for a business meeting, just zoom and scroll to position the graphics you want to reproduce. Then use IBM's Picture Plotting to plot the results. You also get a handy graphics index, so you can file and retrieve pictures for future presentations.

But there's more to the 3270 PC/G or GX than just pretty pictures. Each system can display up to four host graphics

the market for the tied item is restrained (Jefferson Parish Hospital), and the antitrust violation occurs.

The requisite economic power also exists "when the tying product, here Rdos, is patented or copyrighted" because intellectual property protection "confers upon the defendant some advantages not shared by . . . competitors" (Fortner II).

The combination of copyright and the required use of trade secrets "established both the distinctiveness of Rdos and a legal bar to its reproduction by competitors."

DG admitted that it would be impossible for competitors to develop operating system software performing all the functions of Rdos without violating DG's copyright and utilizing its trade secrets, and DG was aggressive about chasing those who appeared to be violating those proprietary rights.

Those who wished to avoid being locked in by DG had to either abandon their own compatible applications software or convert their software to make it compatible with another disk operating system. The court found that conversion under these circumstances was not an economically realistic alternative. As a result, virtually no DG OEM customer had changed to a new supplier.

DG pressed the issue of product choice in the market. When OEMs select an operating system, DG said, they know about the tie. At the point of selection, the OEMs are free to purchase or not. The point, however, is that initial choice is not synonymous with free choice: In the year the suit was initiated, 93% of DG's CPU sales were made to locked-in customers, who were, after the initial sale, also forced to buy from DG for their subsequent needs.

With respect to competitors such as Digidyne, the cost of market entry was high as a result of DG's tie because Digidyne would have been forced to market both the CPU and a disk operating system that were competitive in price and quality.

Antitrust warning signs

The DG case outlines a few antitrust warning signs a company should be aware of in marketing its products. First, and most obvious, watch for tying. If products can be provided separately and selected separately by customers, a tie may be found if the products are not sold separately.

Second, a tying arrangement is assumed by the courts to be illegal if the tying product has a patent or is copyrighted.

Third, trade secrets have their place, but their use should be scrutinized where tying is involved. Fourth, if customers are complaining about the pains and penalties of the bundle, as DG's customers did, listen to them. Failure to do so may push them to get a hearing in court.

Fifth, with respect to pricing, do not attempt to recoup R&D costs by the tie. Software must be sold "separately, at a price that would reflect [R&D]." (U.S. v. Jerrold Electronics). Sixth, do not think for a moment that only monopoly power or a large or even significant share of the market is required to trigger a tying violation. The court in the DG case went to great lengths to dispel that notion. One customer may not hook vendors, but all that is required is the power to cause a customer to buy that which he might not otherwise have bought.

In sum, avoid a combination of factors that can lock in customers; tying arrangements, intellectual property protection, trade secrets and related agreements can create their own bundle of cost, liability and expense.

and Wang is Elk Industries, Inc., a Fort Lauderdale company established for the purpose of filing the suits. Elkins is the firm's major stockholder and Miami attorneys Feldman and Charles A. Levy are listed as officers.

Levy said the list of potential defendants includes both major telecommunications industry players and start-up companies using the allegedly patented technology in their products. "We're evaluating the companies one by one and will take action first against the ones most heavily involved in Florida," Levy said. "We're not looking to hurt anyone. We just want a reckoning by the courts of royalties due to Elkins."

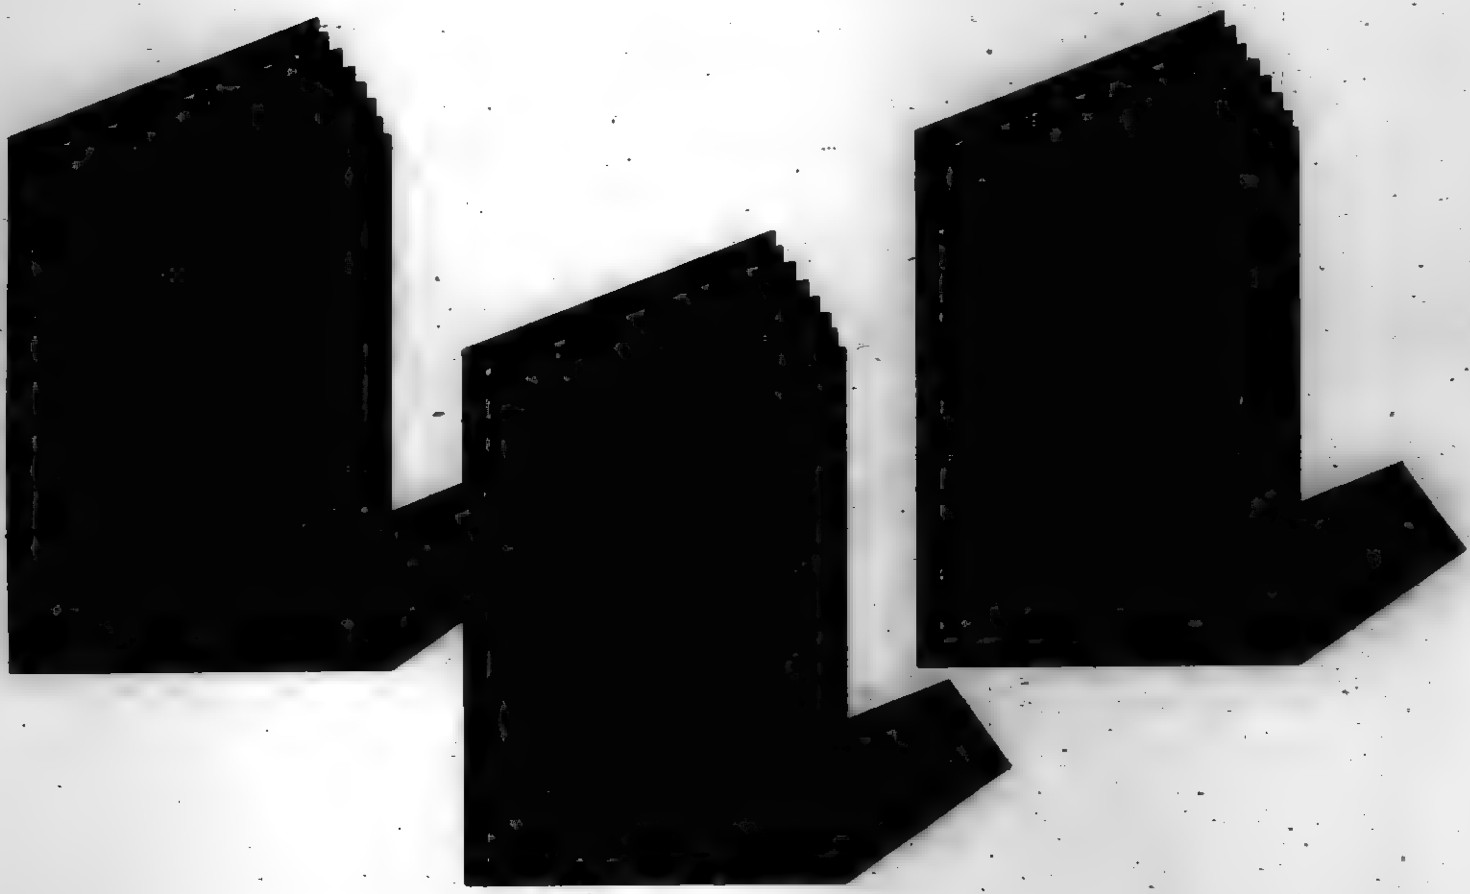
How to make NCC really work for you



Thousands of your customers and potential clients will go to NCC this summmer (in Chicago, July 15-18). And hundreds of thousands more will follow the show by reading Computerworld.

We'll provide our readers with complete coverage of NCC in three special issues — the July 8th Preview issue, the July 15th Show issue, and the July 22nd Wrap-Up issue.

Our editors will showcase the new products; report on the major speeches and seminars; and take a look at industry trends of interest to our readers.

Protect your investment in NCC. Advertise in these issues now to keep your company and your products in front of more than 687,000 computer-involved professionals all during this eventful period.

Call your local Computerworld representative today to reserve space for your NCC campaign. Or call Ed Marecki, Vice President of Sales, at (617) 879-0700. Call now. These issues will be closing soon:

Issue	NCC Preview	NCC Show	NCC Wrap-Up
Issue date	July 8	July 15	July 22
Closing date	June 21	June 28	July 5

AT&T Information Systems to eliminate 1,650 positions

MORRISTOWN, N.J. — Citing an "ongoing effort to drive down unnecessary costs," AT&T Information Systems recently announced plans to eliminate 1,650 jobs in two of its four divisions.

A spokesman said the company would make "all kinds of efforts" to accommodate the employees with local and out-of-state job transfers, retraining and early retirement options. Dismissal of employees that cannot be placed will be a last resort.

The announcement signified AT&T Information Systems' largest job cut of 1985. The division eliminated 6,000 positions last fall as part of AT&T Technologies's reduction of its work force by 11,000 [CW, Sept. 4], the first major cut since the January 1984 divestiture.

The decision announced recently will eliminate 1,000 positions in the eastern region of the General Business Systems Division, headquartered in Atlanta, which markets computers and telecommunications equipment to small businesses. Additional job cuts within the San Francisco-based western region of that division will be announced soon. The operation within the division that markets products to consumers will not be affected.

AT&T will cut 650 jobs in a nationwide consolidation of repair centers in its Services Division, which repairs and maintains both computer and telephone-related products. The current 17 repair facilities will be consolidated in plants in Miami, Kent, Wash., and Plymouth, Mich. The 14 division offices closing their repair operations will remain open for nonrepair functions.

The cuts will not affect positions within the Large Business and Computer Systems Divisions of AT&T Information Systems.

Spokesman Craig Lowder said the cuts affect employees across the board in management, administrative and production line positions. He said the decision was part of AT&T's continuing effort to remain competitive in the postdivestiture environment.

"AT&T Information Systems was a company born with 128,000 employees and not a dollar of revenue," Lowder said. "Two years ago, we identified the need to cut costs nationwide. It's the story of change, and it isn't over. In a competitive market, you are constantly looking at ways to shed unnecessary costs."

Bell Atlantic settles with MCI, reduces liability of subsidiaries

WASHINGTON, D.C. — MCI Communications Corp. recently announced a settlement with Bell Atlantic Corp. reducing overall liability of Bell Atlantic companies in the two antitrust suits filed by MCI against the various entities of the former Bell system.

MCI said the settlement includes cash payments to MCI and a series of business relationships between the two companies. Details of the cash settlement were not released.

The business relationships include arrangements for the seven Bell Atlantic local telephone companies to begin long-distance billing services for MCI and for those companies to purchase MCI's long-distance and other telecommunications services for internal use, MCI said.

The agreement was reportedly signed before a U.S. District Court jury award of $37.8 million was handed down against former Bell System entities in favor of MCI last month. A second antitrust suit is expected to go to trial next year.

STC claims first-quarter net loss due to revenue-recording change

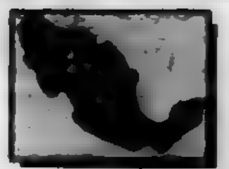
LOUISVILLE, Colo. — Storage Technology Corp. (STC) reported last week a first-quarter net loss of $29.7 million, or 86 cents per share, much of which was attributed to a change in its revenue-recognition policy.

STC said $16.2 million of the loss was due to the cumulative effect from prior periods of a change to record revenue later in the sales cycle; the new policy recognizes income after the products are installed, rather than when they are shipped.

The operating loss for the quarter was $13.5 million, or 39 cents per share. In the year-earlier quarter, the company posted a loss of $16.7 million, or 48 cents per share.

Revenue for the quarter ended March 29 was $81.6 million, down from $98.4 million a year earlier.

Despite the slump for STC, which is operating under protection from Chapter 11 of the Federal Bankruptcy Act, Chairman and Chief Executive Officer Ryal Poppa said orders have been improving, although at a lesser rate than expected.



Reach 20,000 computer professionals in Mexico.

Advertise in CW Communications' Mexican publications and sell your products directly to Mexico's burgeoning computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are over 21,000 computers in Mexico. CW Communications covers the Mexican market with two important publications: *Computerworld Mexico* and *CompuMundo*.

10,000 DP professionals in government, banking and industry read *Computerworld/Mexico*. Modeled after *Computerworld*, its sister publication in the U.S., *Computerworld/Mexico* is considered an excellent way for advertisers to reach a broad range of influential industry leaders. Twice each month, *Computerworld/Mexico* reports developments in hardware, software and terminals as well as industry trends.

CompuMundo covers one of Mexico's fastest growing market segments — microcomputers. Microcomputer growth is expected to jump 15% annually from its current base of 17,000. Each month 10,000 micro users and potential users turn to *CompuMundo* for the latest information on micros, programming and all the latest industry developments. Telecommunications and electronics specialists also rely on *CompuMundo* for up-to-date industry information.

CW International Marketing Services makes advertising your products in Mexico, and around the world, easy. We have over 50 publications in more than 25 countries around the world. For more information on our wide range of services, complete the coupon below and mail today.

sufficient value added to that data," Gartner said. "On Wall Street, you can only succeed if you have clout, if you have impact. We have the same criteria for success in our company."

The company philosophy extends to its seating plan. Helmut Alpers, the firm's executive vice-president of products, said the Gartner Group's market research analysts and Wall Street analysts who work for its subsidiary, GG Group, Inc., a brokerage and investment advisory firm, are now seated side by side.

Alpers, who was once Gartner's boss when both men worked at IBM, said, "We want that interchange." Asked if this presents a conflict — whereas on the one hand the Gartner Group issues opinions on the viability of firms and on the other recommends investments to institutions — Gartner said, "Of course there are conflicts. The issue is that they have to be managed. We do whatever we can to manage the conflict." He noted that consultants sit separated from analysts on a Chinese wall basis.

Staff experience is a company selling point. Gartner described the staff experience at market research firms as a spectrum. At one extreme, he said, is the Gartner Group, which tends to hire experienced analysts, many of whom have worked for other consultants or vendors. "The other companies at the other extreme tend to hire young, bright MBAs," he said, listing Dataquest, Inc., International Data Corp. (IDC) and the Yankee Group as following his firm in staff experience. "Our orientation is to hire more expensive people."

But the company has embarked on an MBA program to achieve a better balance of senior to junior staff, although Gartner claimed his firm will always be more weighted toward experience than is its competitors. "We may be a little too skewed toward senior people, and we will probably, over time, achieve a slightly different balance. But we will always be at the extreme end of the spectrum," he said.

On the viability of his competitors, Gartner said Yankee Group is under severe pressure in the market and Future Computing, Inc. has slowed down. "We grow because the market is increasing, but it is also obvious that we grow at the expense of our competition," he said.

Gartner said he has a good relationship with all his competitors, with one exception. Litigation surrounding the hiring of a Yankee Group consultant by the Gartner Group several years ago has recently been resolved in the Yankee Group's favor (see story below). But in the marketplace, Gartner said, especially in the telecommunications area, "We are beating Yankee Group. Yankee is losing in head-to-head situations with the Gartner Group the vast majority of the time."

Turnover has been low and morale high at the Gartner Group, its executives said. The company offers generous benefits such as a sabbatical after five years of service, a retirement plan that contributes 15% of salary and vests 20% annually and an employee stock option plan.

Morale was a problem for one former Gartner Group employee. "In the beginning, the Gartner Group emphasis was 'group.' Later, the emphasis became 'Gartner.' You could do anything you wanted, as long as it was exactly what [Gartner] wanted," said the former employee, who wished not to be identified.

Despite their differences, the former employee credited Gartner for "being up on where IBM was going," and he credited the company for its financially oriented analysis. "They're not just going out and counting boxes," the former employee said.

Memorable successes

In six years of forecasting and predicting, the Gartner Group claims memorable successes. According to Peter Wright, a corporate vice-president, the most memorable success was the late 1981 prediction of Storage Technology Corp.'s (STC) demise. "That was a year earlier than the stock market recognized it," he said. It was mid-1982 when the stock market lowered estimates of STC's 1982 earnings, he noted.

Another success was the company's prediction in the fall of 1983 of the demise of the peripherals industry (low-end, OEM market) companies, including Seagate Technology, Inc. and Tandon Corp. Competitors were optimistic about the OEMs until late 1984, Wright said, because they overemphasized the capacity of producers in their analyses. The Gartner Group considered demand and then capacity, concluding that reduced prices, lower margins and industry consolidation would result, according to Wright.

Accuracy is the analyst's responsibility first, but any projections or forecasts are discussed in research meetings attended by senior staff. At a typical one- to two-hour meeting, an analyst offers a perspective on some significant event of the past week. Other analysts advance different perspectives, often challenging the first. According to Alpers, "We get a distillation of ideas. And an analyst [improves] pretty quickly when everyone is sharpshooting at him."

Vendors are cooperative in providing market research firms with product strategies and demonstrations, he said. "It's just a matter of [which firm] can absorb the most information and evaluate it most effectively for [its] clients," Gartner said.

The most expensive way that the

Court rules against Gartner in Yankee noncompete suit

BOSTON — Judge James P. Lynch Jr. of Massachusetts Superior Court ruled here recently that a former employee of the Boston-based Yankee Group consulting firm violated a noncompete clause in his contract by going to work for the Stamford, Conn.-based Gartner Group, Inc. consultancy.

As a result of the ruling, the Gartner Group terminated the services of Richard Cohen, who had worked for the Gartner Group since August 1984. For two years prior to that date, Cohen had worked for the Yankee Group. The ruling prevents Cohen from working for a Yankee Group competitor until August.

The ruling also determined that Cohen had access to confidential Yankee Group information and that the Gartner Group and Cohen should be prevented from using the information until the August deadline expires.

The suit, which named Cohen and the Gartner Group as defendants, did not consider the issue of whether proprietary Yankee Group information was ever actually used by the Gartner Group.

Gideon Gartner, president of the Gartner Group, said the defense maintained that the noncompete clause was invalid because it was part of an overall agreement that was violated by the Yankee Group. Gartner also maintained that the Yankee Group's noncompete clause was not applied to all Yankee Group employees of Cohen's level at the firm.

Gartner said the ruling for the Yankee Group "is one of the worst miscarriages of justices ever seen. The judge totally misunderstood what was happening. It was a case that could not be lost." Gartner said he had no reason to appeal the decision because no damages have been assessed.

Gartner said the ruling could have an impact on future entrepreneurs who work for a company in a business related to their enterprise. "If I were [Digital Equipment Corp.], I would ask each of my young and immature employees to sign a noncompete" agreement, Gartner said. "If they went to start their own business, I'd enforce it."

Software firm appoints chief

SAN FRANCISCO — Former Informatics General Corp. President and Chief Operating Officer Bruce T. Coleman was recently named president and chief executive officer of Walker Interactive Products, Inc., a mainframe applications software firm based here.

Coleman succeeds company founder Jeffrey L. Walker, who will retain his position as chairman of the board.

Walker Interactive Products, founded 16 years ago, specializes in financial applications software and has five branch offices in the U.S. and one in London.

HP division targets OA mart

PALO ALTO, Calif. — Hewlett-Packard Co. recently expanded its objectives in the office automation market by establishing an Office Systems division.

The division will be responsible for directing the marketing of the HP 3000 microcomputer lines as OA products, the company said. Robert J. Frankenberg, operations manager of HP's Computer Systems division in Roseville, Calif., was named general manager of the division.

Frankenberg will be responsible for leading the push for OA products from the new division as well as the Sunnyvale, Calif.-based Personal Software division and the Office Productivity division in Pinewood, England. The company said it will continue to pursue the market for integrated office information systems with products such as HP Access software, a micro-mini link.

"HP intends to make a lasting contribution to the evolving [OA] market," said John L. Doyle, executive vice-president and general manager of HP's Information Systems and Networks group. "We have a strong and loyal customer base upon which to build a lasting position in this market."

In addition to the HP 3000 series, the company said it will more aggressively market to OA customers its Touchscreen II and Touchscreen MAX II micros.

Hathaway buys Global Software

DENVER — Hathaway Corp., which was unable to consummate a preliminary agreement to purchase Storage Technology Corp.'s (STC) 54% interest in Global-Ultimacc Systems, Inc., announced last week it had acquired the Global Software, Inc. division of Global-Ultimacc.

The Raleigh, N.C.-based software company was purchased by a newly formed Hathaway subsidiary for $6.9 million in cash and notes. Global Software, a developer of applications packages for IBM computers, had reported 1984 revenue of $8.4 million and was purchased in 1983 by STC for $14 million.

WANG

from page 91

to be at the top of the shipment list whenever the products made it out the door.

But when growth slows, and then appears to be headed for the red-ink zone, those minor problems become very costly.

Bureaucracies created during a company's heyday suddenly become overwhelming debits; product delays result in money flowing out the door instead of the product; and customers realize that not only do they have the luxury of waiting and watching but also that the high-flying suppliers of yesterday could be the court-bound cripples of tomorrow.

Wang now finds itself beset and is rushing to cut costs to a manageable level. Analysts said it may take years for the company to get back on track. Its shipment schedule history hangs like an anchor around its neck; its concessions to MIS decision makers are too little; too late at a point in time when the solidness of IBM is going to look ever more attractive to buyers.

But Wang is just an example hanging out to dry for everyone to see. Its problems are greater because its goals were so far reaching.

Other companies will follow with less noticeable cutbacks, but the effect will be the same. If even IBM, with its broad array of product sectors, is battening down the hatches, a lot of other computer industry players will have to run and hide out from the storm.

■

E. E. Ferrey, president of the American Electronics Association (AEA) recently advised the AEA board of directors that he will turn over the chief executive officer functions to a successor this fall, while continuing as an officer and director until Dec. 31, 1987.

Head of the organization for 25 years, Ferrey reportedly will be elected vice-chairman of the AEA upon selection of a president.

■

Bell South Advanced Systems, Inc., a subsidiary of Bell South Corp., became the latest valued-added reseller of IBM equipment with the recent announcement that it will deal in IBM System/36 and Personal Computer products. The regional phone companies, several of which have opened or acquired computer retail chains, seem intent on using their market presence to carve out a piece of the computer sales pie.

Clean your desk.

Has an avalanche of messages made your desk a mess for the ages? Take heart, you can now clean up your act (and your desk) without cleaning out your budget.

Presenting Northern Telecom Displayphone-Plus,™ which you can now rent from Leasametric.

It's a set-up to forget. Forget about modems, telephones and terminals. Forget about telephone message tags. Displayphone-Plus is a complete information management system in one neat package. With its "electronic mail box" feature, one user can call another and have the message printed out on the receiving end. No fuss, no muss.

All possible because our unit offers download emulation of virtually any cursor-addressing conversational CRT, and plug-and-play compatibility with DEC VT-100™ terminals.

All this, and service that's slick as a whistle. From Leasametric. Each Displayphone-Plus arrives ready to work because we've put it through its paces before we ship to you. You'll get operator's manuals, cables and everything to get you up and running. Plus, to keep you running, a toll-free number for on-line diagnostics. On-site maintenance if it's needed. And the iron-clad Leasametric guarantee to replace any unit immediately, in the unlikely event of a malfunction.

Finally, to make it a clean sweep, great financing. Standard rentals, volume pricing, rentals with options to buy, leasing and even used-equipment purchases.

For more about Displayphone-Plus, or any of the thousands of quality items in our current catalogue, call Leasametric today. In California:
800-528-6891.
Outside California:

Ordinary [illegible] systems take a
very narrow view of your world.

The extraordinary MAPPER® System puts things in true perspective.

Ordinary computer systems see you and your special business problems the way their programs tell them to. Which means they can't see things quite right.

That's because computer programs are either off-the-shelf—designed for some mythical "typical" business. Or they're custom-designed—created by an outsider who's unlikely to have a complete picture of your business.

But meet the Sperry MAPPER System.

It's truly an extension of your mind. Instead of confining you to any fixed program, MAPPER gives you carte blanche to create your own programs. Without doing any programming, in the conventional sense.

As a result, you gain unheard-of power. To make the computer see the full scope of your real world, and deal with it realistically.

MAPPER adapts to the way you work.

You and your people don't have to be computer experts to use MAPPER expertly. Far from it. Simple but powerful English commands get you what you want. A word or two is usually enough.

As you insert and extract information, freed from rigid procedures, you create your program along the way. So you can make mistakes. Change your mind. Even alter your destination in mid-journey.

MAPPER does more than work the way you work. It actually follows the way you think.

MAPPER can serve a handful. Or handle a thousand.

The MAPPER System can be scaled for a major corporation, for a single department, or for a growing business. You can even timeshare through a Sperry service bureau.

So no matter what size your business, the power of MAPPER is affordable. In fact, it can cost as little as a network of ordinary personal computers.

Come see MAPPER in action—hands-on, at a nearby Sperry Productivity Center. Phone toll-free. **800-547-8362** Or send us the coupon.

pricing of their [256K-byte chips] going from $50 to $20 to $12 is significantly faster than normal, even in a downturn," he said.

Sopkin expressed concern that a Japanese market share edge in current 256K-byte Eprom technology could dampen American competitiveness in new chip technologies expected to enter volume production in the next two years, such as 1M-byte random-access memory (RAM) chips. "If we back away from Eproms now, it's like taking the appeasement approach in World War II," he said. "Let them have one market and they want the others. They've already made it impossible for anyone to make money in [dynamic RAM chips]; now they want to do the same in static RAM and Eprom chips.

"I think the public and the [Reagan] administration have passed over the trade issue for too long, but the public is beginning to realize we are liable to lose the technology battle," Sopkin continued. "If semiconductors go, so go computers."

Japanese vendors held 67.9% of the $483.4 million U.S. 64K-byte Eprom market last year, according to Dataquest, Inc., a San Jose, Calif. market research firm. American manufacturers fear similar trends in the 256K-byte market, where Japanese vendors shipped 17.6% of the $93.4 million worth of chips ordered by U.S. customers in 1984.

The Semiconductor Industry Association (SIA), while stopping short of calling for import quotas, echoed Sopkin's comments about the significance of the Eprom market. "Our big reason for concern is that [failure in] this market will drive U.S. companies out and they won't be able to compete in later generations of semiconductors," said SIA Manager of Governmental Affairs Daryl Hatano. "We're continuing to look at the situation and will formulate our response sometime in the future."

An Intel Corp. spokeswoman said the company is not recommending any specific action limiting access to U.S. markets, but will support "action that would open [the Japanese] market to competition."

Some industry observers believe most other U.S. semiconductor vendors will shortly begin pressuring the Reagan administration to adopt import quotas on Japanese chips. "There really are no free traders left in this industry sector," said A. A. LaFountain III, president of LaFountain Research Corp. in Bay Head, N.J. "At low points in the cycle people feel the pain so much that they cry uncle."

McDonnell Douglas taps info systems execs

ST. LOUIS — Two McDonnell Douglas Corp. vice-presidents have been appointed to head the aerospace giant's reorganized McDonnell Douglas Information Systems Group.

Robert A. Fischer, president of the former McDonnell Douglas Automation Co., was named to the post of executive officer of the Information Systems Group.

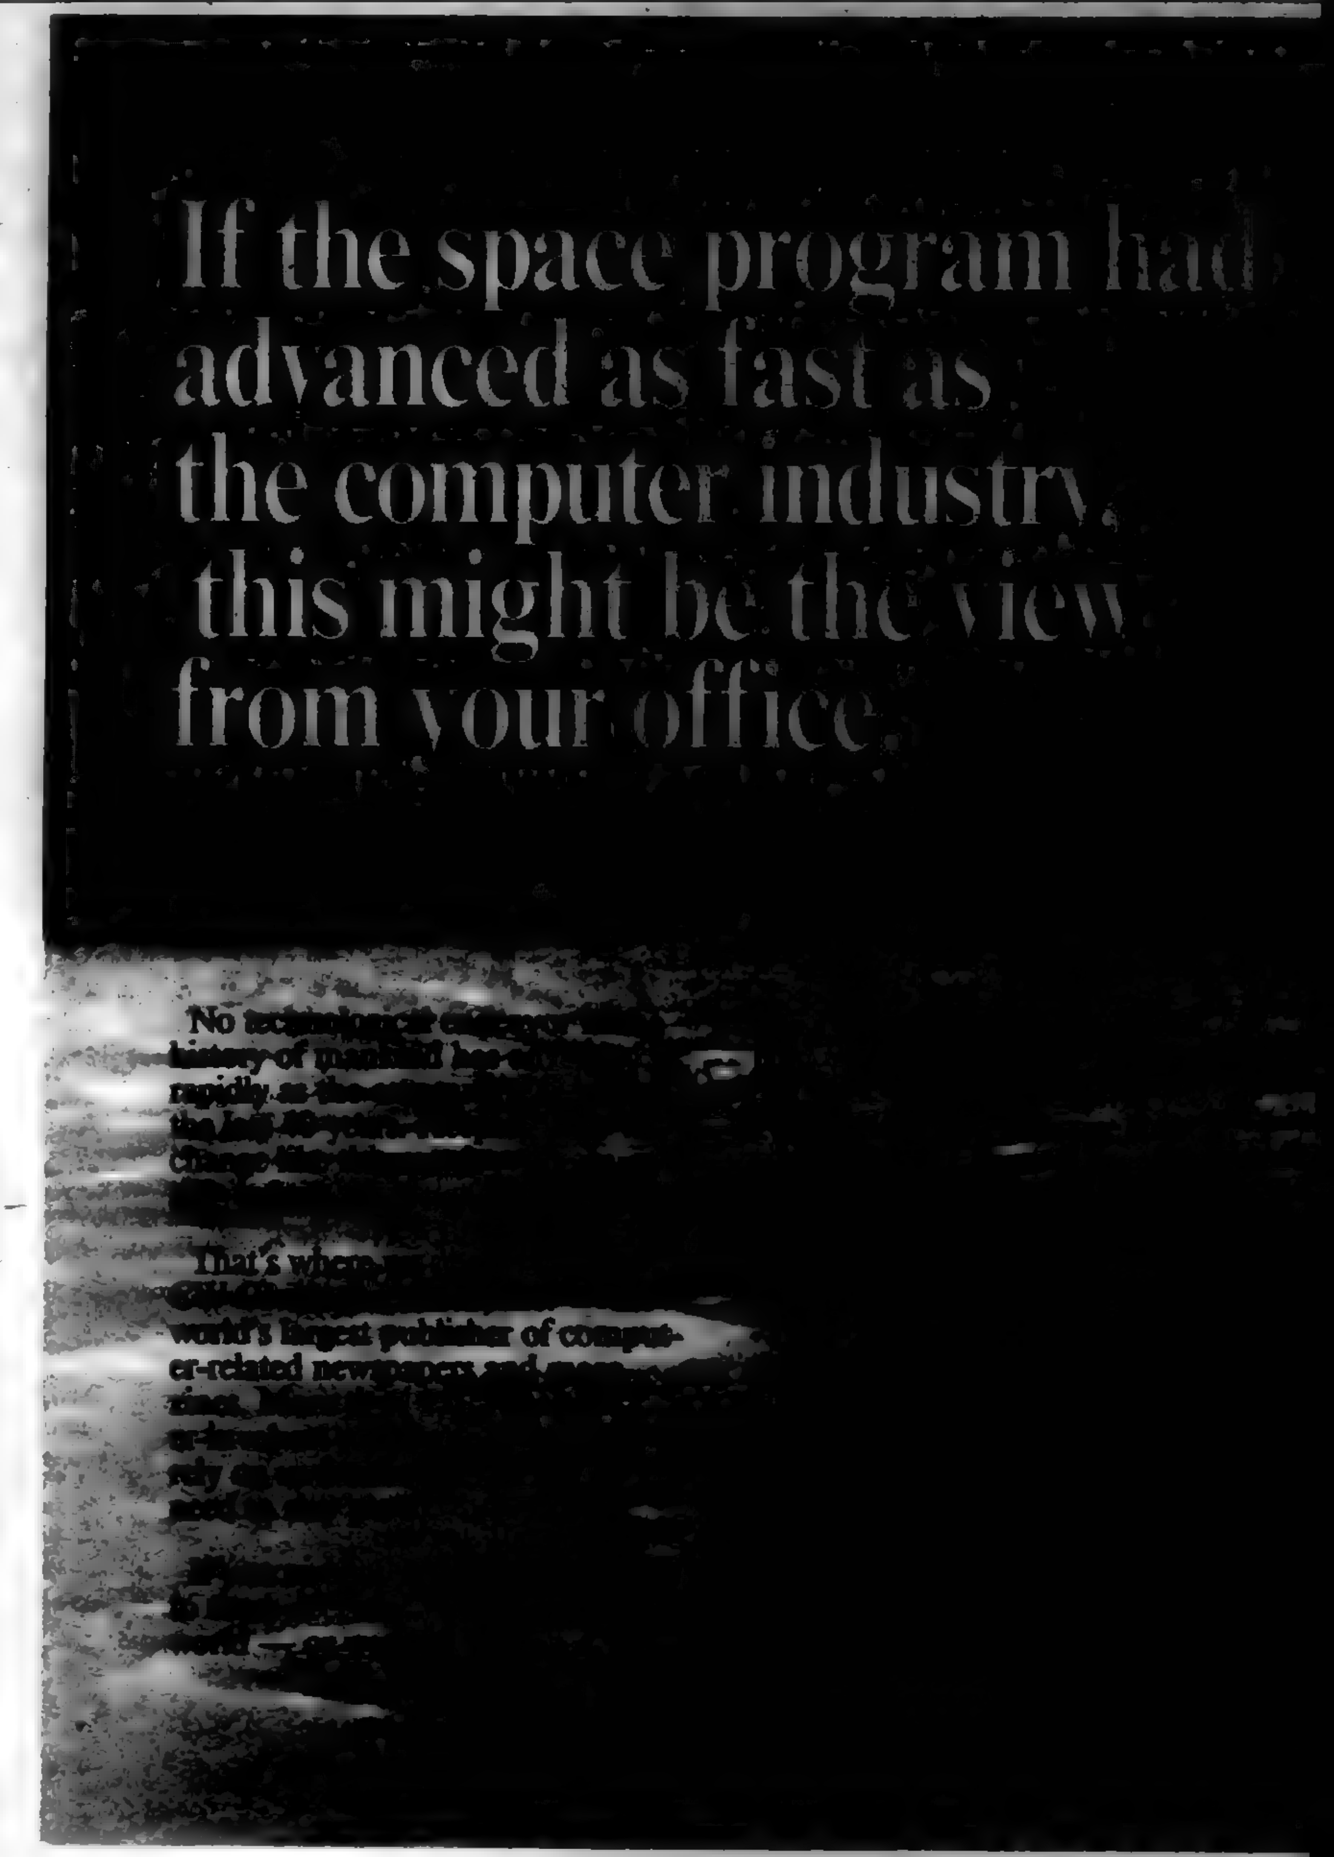
Gary E. Liebl, former president and chief executive officer of McDonnell Douglas Computer Systems Co., was named the group's operating officer.

The move frees McDonnell Douglas President John A. McDonnell from direct responsibility for the Information Systems Group.

The group, which reported total revenue of $1 billion last year, was formerly run by an executive board of all three men. McDonnell will return full time to his role as corporate president, the company said.

Fischer, whose office is based in St. Louis, will be responsible for strategic planning, policy formulation and coordination, acquisitions and divestitures, group organizational matters and supervision of staff.

Liebl, whose office is based in Newport Beach, Calif., will be responsible for the Information System Group's business units, operating plans, productivity programs and business unit organizational matters.



If the space program had advanced as fast as the computer industry, this might be the view from your office.

Fujitsu regroups U.S. division into subsidiary

SAN JOSE, Calif. — Seeking to market its microcomputer systems in the U.S. more aggressively, Japan's Fujitsu Ltd. recently announced that its Professional Microsystems Division will become a wholly owned subsidiary of Fujitsu America, Inc. (FAI).

The division has been renamed Fujitsu Microsystems of America, Inc. as of June 1. It was previously owned by Fujitsu's other U.S. subsidiary, semiconductor maker Fujitsu Microelectronics, Inc.

"Fujitsu's expansion worldwide has necessitated this move to increase the marketing strength of its acknowledged technological leadership in the computer industry," said Fujitsu Microsystems Vice-President Wayne Wahlenmeier. "Our realignment with FAI will have a positive effect on our U.S. marketing efforts and will provide increased support as our product line develops."

Fujitsu hopes to spur U.S. sales of such products as its Micro 16S series of business computers and its recently introduced Micro 16 System 2000, which is based on the Pick Systems Pick operating system.

The U.S. reorganization is the second realignment within Fujitsu this year. In April, the company consolidated its worldwide personal computer manufacturing, marketing and sales within its Computer Systems Group.

SERIES from page 96

Gartner Group obtains information is with the Comtec data base, compiled from a survey that cost $3 million in its first year and $2.7 million this year. Burke Marketing Services, Inc., a Gartner Group partner, compiles the data from 8,000 interviews, charting information technology use in 20 product categories.

Vendors are the target market for the Comtec data, which costs from $50,000 to $250,000 to buy, but Gartner Group analysts use Comtec to identify trends, Gartner said.

> *'The whole style of our company is a business style.'*
>
> — Gideon Gartner
> The Gartner Group, Inc.

Users are another key source of information. "We are today the largest provider of services to large users of DP, telecommunications and office equipment in the world," Gartner claimed. "We effectively came from nowhere and have become the dominant force in that part of our business." He challenged any of his competitors who dispute the claim to compare client lists.

IDC, which is famed for its data, provides processor-oriented data that is not as well defined as data the Gartner Group provides, Gartner said. "We collect many more data points that IDC does. The IDC data files are oriented toward collecting information on processors and what software is in the processor. The clients are totally different," he said.

Gartner also claimed that no one competes with Comtec, while IDC competes with Focus Research Systems, Inc. and Computer Intelligence Co.

Alpers added, "The whole thrust of what we do here is to try to net it out for our clients."

SUIT from page 96

Yankee Group President Howard Anderson said, "We are very happy the judge [ruled in our favor], and we are happy that our proprietary information has been judged to be sacrosanct."

Anderson agreed with Gartner that the decision may have an impact on employees who leave one firm to work for another or to start their own firms, but he said the impact will be good.

Cohen has filed a counterclaim asserting that the Yankee Group deprived him of commissions he earned while a Yankee Group employee.

— John Desmond

POSITION ANNOUNCEMENTS

"It's easy to make good decisions when there are no bad options."
Robert Half on Hiring by Robert Half (Crown)

How to be more successful in your edp hiring.

Using a specialist will increase your success in hiring data processing personnel—and using Robert Half, the most experienced personnel specialist, will increase your chance of success even more. Here's why:

- You get highly personalized service from professionals who understand your edp needs.
- You won't waste time with unqualified candidates. (We'd prefer *not* to fill the job, rather than refer someone who doesn't fit.)
- You'll have the advantage of the resources of the largest organization in the data processing personnel field, with offices on three continents.
- You pay nothing unless we fill the job. And, we back each and every placement with a liberal guarantee.

The next time you're looking for a data processing manager, systems analyst, MIS expert or programmer, call a nearby Robert Half office. You'll be glad you did.

ROBERT HALF®
edp, accounting and financial personnel specialists.

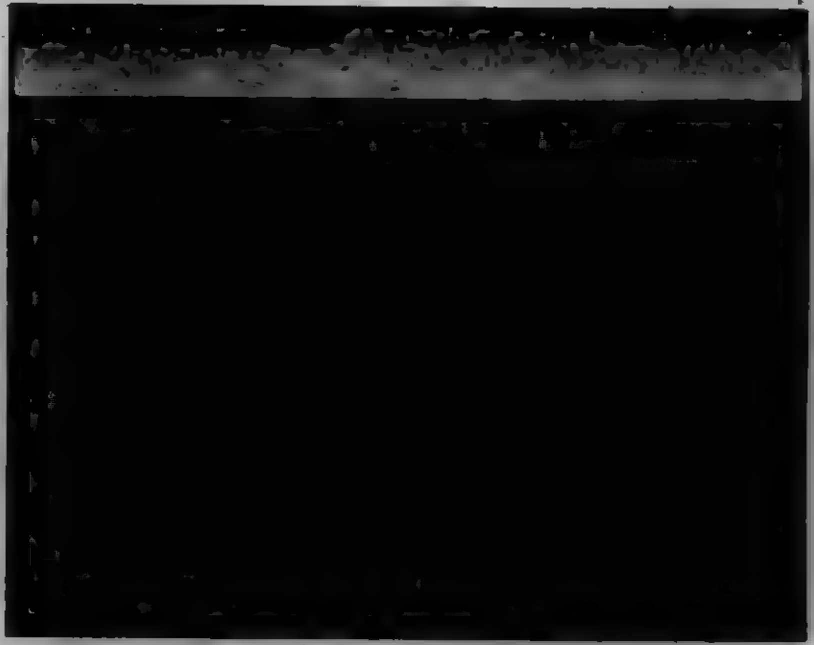
The key to a better system isn't hardware or software.



It's people like you.

Throughout its corporate life, The Boeing Company has prospered by staying at the leading edge of technology. While still providing on-time quality products and services, all within budget. And achieving impressive goals like the introduction of two of the world's most technologically advanced commercial aircraft — all in one year.

This enviable record has been particularly visible at Boeing Computer Services, where we are constantly faced with the challenges of explosive growth in information services. Challenges we meet on a day-to-day basis.

The unique knowledge we've gained, and the management tools we've developed, have assured our success. And are in even greater demand today than ever before. Because of this demand, we have immediate openings for the following special skills:

SYSTEMS ANALYSIS
- Structured design methodology experience
- On-line data base processing competence with emphasis on major system development and/or conversion
- Large-scale IBM MVS, TSO, VM CMS environment
- MVS/VS performance and capacity planning, CICS and IMS-DS performance analysis, and MVS security analysis
- Applications related to SAS, FORTRAN, and COBOL programs (and other mainframe data base systems)

NETWORK ANALYSIS AND MANAGEMENT
- Large-scale systems engineering and integration
- Voice, video and fax
- Telecommunications protocols (SNA and X.25)
- LAN design

SYSTEMS PROGRAMMING
- IBM VM, MVS/XA, IMS, DOS/VSE, CICS
- NSC HYPERCHANNEL
- CYBER site support

The ideal candidates will possess at least 5 years of related data processing experience and a degree in Computer Science, MIS or related area or equivalent experience. Potential locations include:

- Philadelphia
- Chicago
- Washington, D.C.

And surrounding metropolitan areas.

We offer a complete and comprehensive compensation program as well as some of the industry's finest training. Our Vienna, VA Data Center is one of the largest and most technically advanced in the Washington metro area.

TO APPLY, CONTACT OUR COMPUTER!

For more information about Boeing Computer Services, our benefits, and our available opportunities, contact our Boeing On-Line Career Network. You have two options: (1) From any push-button phone, call the Recruiter Computer at (617) 275-4462. Wait until the Computer answers. When requested, use the buttons on your telephone to enter your User ID 200#224# and your Password BCS#. (Be sure to enter the "#" as shown.)

Or (2) Use your PC or terminal — simply dial (617) 275-4112, press return, enter the password "BCS", and press return again. You'll get current information, and you can even send us a brief resume on-line!

For immediate consideration, just send your resume, including salary history, in strictest confidence to:

EDP PROFESSIONALS

Shape The Future Of One Of The World's Most Advanced Mainframe Networks.

When Aramco Services Company in Houston hires you for our Computer Planning Division, you'll be working in support of Aramco—the largest oil-producing company in the world. You will discover a higher order of technical challenge in our state-of-the-art network environment with IBM 308x mainframe computers, MVS/XA, TSO, and IMS. If you have an appropriate degree and 5-7 years experience, join us in one of the following roles:

Systems Products Planning Specialist
BS in Computer Science or related area and 7 years extensive background on IBM systems products for the MVS environment. They will have functioned as a Systems Programmer, Systems Programming Manager or Systems Planner with significant experience in a large IBM mainframe environment. The job involves planning strategic directions for systems product software, performing evaluations, preparing justifications, and life-cycle analysis.

Data Administrator
BS Computer Science or related area. Involves developing the corporate data administration function, establishing policies/procedures, defining the tools, techniques and activities to ensure the proper administration of the corporate data resource. Requires an extensive background in data base administration, applications systems analysis with a strong emphasis on on-line database-oriented systems, and strategic planning.

Hardware Analyst
BS Computer Science or related area. Involves evaluating and selecting hardware to support a large IBM mainframe environment. Must possess a general knowledge of IBM 37XX communication processors and software (ACF/VTAM, NCP) and the parameters to support them; a background in the physical requirements and environmental needs of computer hardware; and preferably, a knowledge of TSO and SAS.

Systems Programmer
BS in Computer Science or related area. 5-7 years experience in an IBM MVS or MVS/XA environment. 370 Assembler language proficiency, IMS installation and support experience, ACF/VTAM, ACF/NCP, SNA networking and support experience. MVS or MVS/XA with SMP-E support experience, MVS or MVS/XA program product experience. May require short term overseas assignments.

Computer Operator
High school diploma and 5 years of operator experience in an IBM mainframe operation. Must be familiar with the following software: JES2, MVS/XA, TSO/SPF, TMS and IMS. Must be familiar with the following IBM equipment: 3814, 3081, 3880, 3380, 3803, 3725, 3420, 3350, and STC 4305. Rotating shift and offset work week. Overtime required.

Office Automation Analyst
Requires a BS in Computer Science, Business Administration, or Engineering, and 6 years systems analysis experience in the field of office automation, using minicomputers and microprocessors. Also required is the ability to perform systems engineering, problem analysis, office automation evaluation; make recommendations; and handle project management. Wang and IBM OA experience preferred. Experience with SAS and Mark IV desirable.

We offer competitive salaries, extensive benefit programs including medical/dental coverage, savings plan with company participation, continuing education programs, a company cafeteria and van pools.

For immediate consideration, call Chip Smith at (713) 432-6116.

Or send resume to Chip Smith, Aramco Services Company, Dept. 8491-E, P.O. Box 4530, Houston, Texas 77210.

Programming Opportunities

There is an exciting career opportunity for motivated individuals with computer expertise. If you have experience with on-line interactive computing, you may qualify for one of the following positions in our state-of-the-art automated office environment.

Systems Programmers

Working from our corporate headquarters, this assignment will entail challenging duties on VM/SP system software products. You must have proficiency in IBM Assembler language and an understanding of compilers, editors, and operating systems. Preferred candidates will have a degree in Computer Science plus one year experience with VM/SP. Knowledge of SNA and IBM PC's is a plus.

Applications Programmers

You will assist users in developing business applications ranging from a comprehensive Budget System to spread sheets to word processing and graphics. Our preferred candidate will have a degree in Computer Science and one year experience in an interactive environment with knowledge of a fourth generation language such as FOCUS.

These positions feature an attractive compensation package. For immediate and confidential consideration, please send your resume to:

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA

- **Senior Systems Software Analyst—MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA
- **Senior System Software Analyst—CICS**
  Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE.

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

NEW ORLEANS

Spicy! That's the flavor of New Orleans. New Orleans provides its residents an enviable lifestyle. Great restaurants, a warm climate, and world renowned celebrations, such as Mardi Gras and the New Orleans Jazz and Heritage Festival, have kept New Orleans the Queen city of the south.

But New Orleans is much more than a great place to live. It's a great place to further your Data Processing career. New Orleans is the home of MIDDLE SOUTH SERVICES, INC., the service arm of the Middle South Utility System.

MIDDLE SOUTH SERVICES is currently involved in several projects including large scale IMS DB/DC systems development. The current hardware environment consists of (2) IBM 3084's, MVS/XA, 4341 VM, and Tandem.

STANDARDS ANALYST

An experienced Data Processing professional is needed to fill the position of Standards Analyst. You will work in a planning and control capacity to determine compliance with shop standards for application maintenance/development. Three years of experience in working with standards is required for this position.

ANALYST/PROGRAMMER

Analyst/Programmer with two years of IMS DB/DC designing and coding experience on large systems is needed to work on systems interface and production support. Knowledge of TSO/ISPF, JCL and utilities required. PL-1, BTS and experience in developing application systems interfaces preferred.

VTAM SYSTEMS PROGRAMMER

Position involves the performance tuning of our large scale (2500 plus devices) VTAM/NCP Network. The position requires a background in VTAM/NCP software installation, as well as network problem identification and resolution.

MIDDLE SOUTH SERVICES' relocation package includes: relocation allowance (one month's salary) ... paid moving expenses ... paid house hunting trip ... mortgage interest differential ... plus interim living.

We offer an excellent benefits program and compensation package. For more information contact Joe Holard or Byron Heath:

COMPUTERWORLD

The Recruitment Connection...

... the best connection to have when you are looking for quality computer professionals. There is a good reason why COMPUTERWORLD is the number 1 computer industry trade newspaper. No other newspaper of its kind can give you the broad exposure that you will get by advertising in COMPUTERWORLD. It is read by over half a million people, most of them top-notch professionals with top-notch computer companies.

COMPUTERWORLD publishes every Monday and the deadline for receiving your advertisement is always ten days prior to the issue date desired. The open line rate is $10.35 per line with a minimum size of 2 column inches. Send in either camera-ready material or clearly typed copy with a layout if desired. We also have a telecopier service and salesmen who will gladly take copy over the phone.

Our mailing address is COMPUTERWORLD, Classified Advertising, 375 Cochituate Road, Box 880, Framingham, MA 01701. Or call for more information at 1-800-343-6474 or, in Massachusetts, (617)879-0700.

Bentley College

DIRECTOR OF COMPUTER AND NETWORK SERVICES

Applications are invited for this newly created position which reports to the Vice President for Information Services. The Director of Computer and Network Services will be responsible for planning and implementing a campus-wide data, voice and video communications network, and will have the responsibility for the management of the computer center which services the instructional and administrative computing needs of the College. The Director supervises the activities of the Manager of Systems and Operations, the Communications Network Manager, and a staff of maintenance technicians who service network and telephone equipment.

The individual selected must have extensive experience in managing a large-scale network oriented center since the current facility has a network of over 400 terminals and micros connected to 5 Prime computers, 1 IBM, and 1 DEC system. All of these are front-ended by a MICOM switch and a broadband LAN. This network is expected to double in size during the next year and reach 4,000 nodes by 1988. In addition, the ideal candidate will have a total of 5-8 years experience in operations management, a master's degree in a related field or MBA, and experience with local area and communications networks.

The College is located nine miles west of Boston and is known for its excellence in preparing men and women for careers in business-related professions. There are approximately 8,000 full and part-time undergraduate and graduate students in day and evening programs which are also offered in Computer Information Systems. Use of computers and associated software is integrated into course work in virtually all business departments and programs, and the College is heavily committed towards the expansion of the use of computers for academic support and administration.

Qualified individuals interested in this position should forward a resume, three references, and a salary history to the Human Resources Department, Bentley College, Beaver and Forest Streets, Waltham, Massachusetts 02254.

PROGRAMMING SUPERVISOR

Be a leader at Gillette-Paper Mate.

As a major division of a Fortune 500 Company, Gillette-Paper Mate is one of the world's largest manufacturers of writing instruments. Dynamic growth and the increasingly important role of MIS have created an outstanding supervisory opportunity for a Programming Professional to take on a position of leadership and become an integral part of a major manufacturing implementation (AMAPS) in an IBM DOS environment.

Supervising a staff of 5 Programmer/Analysts, you'll plan, assign and direct the implementation of major new projects. While this is primarily a supervisory role, you should also have the solid technical background necessary for hands-on problem solving. Proficiency in COBOL programming is essential, as is experience in an IBM mainframe environment utilizing DOS, VSE and CICS applications.

We'll reward your project/people management skills with an excellent salary and comprehensive benefits in a progressive, state-of-the-art environment. Please submit your resume with salary history in confidence to:

Don't trust us to keep your classified information secret

Every week, we deliver more of your target audience than anyone else. Over 600,000 computer-involved professionals. Including MIS/DP directors, systems analysts, programmers, and engineers – as well as corporate presidents, treasurers, and general managers.

And we deliver these readers for less. Compare costs and the people reached. You'll see that Computerworld is the number one medium for reaching MIS/DP professionals.

We make your ads work harder. Because we divide the classified section into logical categories: Position Announcements; Buy, Sell, Swap; Software For Sale; Time & Services; and The Bulletin Board. (Available on request: Software Wanted; Business Opportunities; and Real Estate).

We'll even typeset your ad at no extra charge. All you need to do is attach clean typewritten copy to your order. (Figure about 25 words per column inch, not including headlines). Or give us your order over the phone. We'll do the rest.

And since we're published weekly, we can offer you a fast turn-around from when you place your order to when your ad appears. As little as 10 days.

The next time you want results, advertise in Computerworld classified pages. Call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700. Call now. COMPUTERWORLD, Box 880, 375 Cochituate Road, Framingham, MA 01701
